

4ESS / APS
OM-4A001-01

TITLE: 4ESS™ / APS Output Manual Quarterly Update Package
User's Instructions

This package contains the output message changes for Issue 9.4 (Complement to Generic 4E27 Release 2). These messages should be incorporated in the main 4ESS™ / APS Output Message Manual (OM-4A001-01).

The table below lists output messages and other manual items that have changed since the last issue of this manual. Each volume of the manual is listed with the accompanying changed messages for that volume.

Both feature specific as well as other changed messages are included in this update. Check for a "Yes" in the Feature Specific column in the table to determine if the message is feature related. If you need to see how to use these messages, please refer to the User Guidelines section in the main Output Message Manual.

If you notice any errors in this manual, please contact us by using the Error Reporting Form included in this package.

Thank you.

The following messages should be added, deleted, or replaced in the OM-4A001-01 Output Manual:

Description or Message ID	Add, Delete, Replace	Feature Specific
Volume 2		
TAB REPT (a)		
REPT:AMA-CONFIG	Replace	Yes

4ESS / APS
OM-4A001-01

INTRODUCTION

SEE PROPRIETARY NOTICE ON COVER PAGE

Issue 9.4
July 2002

SECTION 1

INTRODUCTION

1.1 PURPOSE

The 4ESS™ / APS Output Message Document describes the messages that are printed through the Attached Processor System (APS) output channels when the APS is used with the 4ESS™ Switch. It is designed, together with the 4ESS™ / APS Input Message Document (IM-4A001-01), as a reference for work center personnel and support groups whose applications communicate with the APS.

The APS consists of two Attached Processor Interfaces (APIs) and a 3B20D computer. The APIs provide a communication path between the 1B processor and the 3B computer. The 3B computer is maintained by its UNIX® RTR Operating System.

The messages in Issue 9.4 of this document represent complete documentation for the generic releases 4AP12 and later.

1.2 LUCENT TECHNOLOGIES

As a result of the AT&T divestiture, the AT&T Network Systems division becomes Lucent Technologies, a separate and independent corporation. The 4ESS™ / APS switch, and many other network and transmission products become products of Lucent Technologies. The marketing, sales, engineering, delivery, installation, support, and future development of these products will be provided by Lucent Technologies.

Therefore, the corporate name and logo on this document are being changed from the AT&T brand to the new Lucent Technologies brand. The AT&T name is being removed from the cover, spine, title page, content (where appropriate) as well as the 9-digit document order number.

All modules of this document are not being reissued to make these changes. Instead, the pages will be reissued over a period of time as technical and other changes are required. Customers on standing order for this document, as of this publication, will see references to the AT&T name on previous-issue pages. Customers receiving new orders for this document will see the references changed to the Lucent Technologies name throughout the document as appropriate. Exceptions may exist in software-driven elements such as Input/Output messages, recent change screens, Master Control Complex (MCC) screens, etc.. These elements will not be changed in this document until such time as they are changed in the software code.

Document updates will not be made specifically to remove historical references to AT&T, especially in cases where the Network Systems division of AT&T, now Lucent Technologies, provided the product or service in question.

SEE PROPRIETARY NOTICE ON COVER PAGE

1.3 ORGANIZATION

The 4ESS™ / APS Output Message document describes the messages available on the Attached Processor System Output channels.

- The **INTRODUCTION** section explains the purpose of the document and the organization of material presented. It also contains a brief overview of output message functions and discusses the documentation management system used in producing this document.
- The **USER GUIDELINES** section contains instructional information to guide the user in interpreting message formats and descriptions. It deals with the structure of output messages, variety of formats they use and the organization and content of the message descriptions.
- The **INDEX** section is an alphabetical output message index, by action verb and identification field. It may be used as a guide for selecting specific messages described in the OUTPUT MESSAGES section.
- The **OUTPUT MESSAGES** section contains the message documentation, presented in alphabetical order by message name. Individual descriptions are grouped according to the action verb in the message name.

1.4 OUTPUT MESSAGE FUNCTIONS

The 4ESS™ / APS output messages documented here are generated in response to an input message or to conditions in the system that require user notification.

Because of the variety of formats found in output messages (they may contain from one to hundreds of lines of output), it is important to know the different forms these messages can take and the kinds of data they contain. The user should be thoroughly familiar with the rules of structure (message fields) discussed in the **USER GUIDELINES** section. Particular attention should be given to the priority-of-action field; this field gives the importance of the message and, thus, the urgency of action to be taken.

1.5 DOCUMENTATION MANAGEMENT

This document and its related input message document represent the first phase of a computer-aided system for managing the documentation of input and output messages. The system consists of a database containing the message documentation, and software to help maintain and update the information in the database. Four categories of key data (see the **USER GUIDELINES** section) are used to link each message to the processing software for selective retrieval.

SEE PROPRIETARY NOTICE ON COVER PAGE

Several interrelated goals have been established for the documentation management system:

- Increase the accuracy of user documentation.
- Speed the availability of updates.
- Improve the readability of the message-format presentation.
- Simplify output of complete or selected message documents (e.g., by application or generic).

Initially, the message database will be accessed only by documentation specialists responsible for the output, correction, and update of the message documentation. A later goal is to provide direct user access to the database for retrieving selected message parts or fully formatted printouts of completed message text.

1.6 ERROR REPORTING PROCEDURES

User reporting of documentation errors is an important element in the effectiveness of the documentation management system. Users are encouraged to report any errors encountered, and to suggest changes or additions that would make the documentation more usable or more complete.

An error-reporting form is included with this document. The form should be used to report any technical errors found in this document. It should be completed and mailed to:

Lucent Technologies
Lucent Learning
IH 4F-326
P.O. Box 3033
Naperville, Illinois 60566-7033

Users are also encouraged to take a few minutes to complete and mail the feedback form provided with this document. Comments received are helpful in preparing future editions.

To report critical problems, such as service-affecting errors that may occur when using this document, please call the following hotline number: 1-800-225-4672.

To order a copy of this document, please call Lucent Technologies Customer Information Center:

1-888-LUCENT-8 (1-888-582-3688).

Issue 9.4
July 2002

SECTION 2

OUTPUT MESSAGE USER GUIDELINES

2.1 INTRODUCTION

When interpreting 4ESS™ / APS output messages, certain rules of structure and format are important to remember. All messages displayed by the system contain certain fields that are printed in a prescribed order. This arrangement of output message information creates the message structure. Within the message structure is the body of the message, which can be presented in various ways for documentation purposes. The way in which it is presented is referred to as the message format.

This section contains a description of the output message structure fields and guidelines for using the individual message format interpretations presented in the OUTPUT MESSAGES section.

2.2 OUTPUT MESSAGE STRUCTURE

The messages output from the 4ESS™ / APS switch follow a defined structure. This structure is summarized here.

2.2.1 Message Fields

When an output message is printed by the system, it is displayed within a prescribed structure consisting of several *fields* of information. The following example shows how an output message might look when displayed.

```
A 59 RMV CU 0 ABORTED 1  
01/01/00 10:59:30 #46
```

The preceding message contains five fields, which are interpreted as follows:

A	= Priority of action
59	= Abbreviated time
RMV CU 0 ABORTED 1	= Body of message
01/01/00 10:59:30	= Optional date and full time
#46	= Optional sequence number

Except for the optional data, these fields are present in most output messages. They will always be printed in the order shown.

SEE PROPRIETARY NOTICE ON COVER PAGE

2.2.2 Explanation of Message Fields

Each of the five message fields conveys a specific type of information.

- *Priority of Action Field* - Indicates the urgency of action required in response to the message and whether it is generated with an audible alarm. The characters or blanks printed by the system are interpreted as follows:

Printed Characters	Priority	Alarm/Nonalarm Action
*C	Critical	Accompanied by a critical alarm. Immediate action required.
* *	Major	Accompanied by a major alarm. Immediate action required.
* *	Power Failure	Accompanied by a major alarm. Immediate action required.
*	Minor	Accompanied by a continuous minor alarm. Action required.
*	Spurt Minor	Accompanied by a spurt minor alarm. Action required.
M	Manual	Response to a manual request.
A	Action	Automatically generated. Action may be required.
	Information	Gives information about a specific event or problem. Automatically generated.

- *Abbreviated Time Field* - Contains the minutes after the hour at which the message started to print.
- *Body of Message* - Contains message data, including message identification, a termination report, and, if necessary, detailed results. Additional information relating to the body of the message is explained in Section 2.3.
- *Full Date and Time Field* - Optional. Consists of the month, day, and year, separated by slashes along with the hour, minutes, and seconds, separated by colons. The time is referenced to a 24-hour clock. The full time, which refers to the time the message was translated (made ready for output) by the system, will agree with the abbreviated time.

SEE PROPRIETARY NOTICE ON COVER PAGE

- *Sequence Number* - Optional. Represents the order in which the message was prepared for printing. This may differ from the order in which the messages were printed.

The sequence in which messages are printed depends on two factors, the priority of action code associated with a message and whether the receiving device has a prioritized queue.

2.3 OUTPUT MESSAGE FORMAT

Most messages can be printed out in more than one form. For example, different forms of the DGN-CU message are displayed to specify the overall diagnostic results and the termination mode, and to specify the diagnostic results for an individual phase.

The multiple forms that an output message may take, combined with the fact that an output message may display from one to hundreds of lines of output, necessitates a flexible format. Although individual message descriptions presented in the OUTPUT MESSAGES section should be relied on for message interpretation, a few general comments about message format are made here.

Throughout the message documentation, constant width capital letters are used to denote information that is printed out exactly as is. Constant width lower case letters are used to denote variables. For example, the RMV-DFC message takes the form,

RMV DFC a b

with the letters a and b representing the member number of the DFC and the termination report of the message. The output seen by the user might be:

RMV DFC 1 COMPLETED

and would include the other message structure fields previously described.

Message formats occasionally include string notation (brackets [], braces {}, and OR bars |). This happens particularly when an output message contains a number of possible responses and one or more may be printed. The notation is for documentation purposes only; it is not output. A detailed explanation of string notation can be found in the *4ESS™/APS Input Message Document (IM-4A001-01)*.

2.4 ORGANIZATION AND CONTENT

Each message description begins with a block of key data (*key block*) identifying the message, followed by descriptive material explaining the message format and its specific use.

SEE PROPRIETARY NOTICE ON COVER PAGE

2.4.1 Key Block Data

The entries in the key block are used as index keys to access the computerized message data base developed for this documentation.

Five index keys are given for each output message:

- **ID** - This is a unique identifier for the message and is used to access the data base. It may or may not be the same as the message name. The message name and ID will be different if the message name, including punctuation, exceeds 12 characters, or if several messages share the same message name, or if versions of the messages are limited to particular releases.

The message name, not the ID, appears as part of the message. It also appears at the upper right corner of each message page. The ID is used for accessing message documentation from the data base, and as a page-number prefix.

- **WORK CENTER** - Specifies the work center at which the message is entered or output. At present, all 4ESS™ / APS messages are entered or output at the Maintenance Operations Center (MOC).
- **GENERIC** - Gives the earliest active generic to which this version of the message applies. Generics 4AP12, 4AP13, 4AP14, 4AP15, 4AP16, 4AP17, and 4AP18 are considered active. The generic key block entry may also indicate the generics to which the message does not apply. For example:
 - 4AP12 only — The message applies to generic 4AP12, but is not applicable to 4AP13.
- **APPLICATION** - Distinguishes the usage of the message. The classifications are:
 - 4E — The message applies to nonprocessor programs of the APS.
 - 4E,3B — The message applies to the 3B computer of the APS.
 - 4E,3B-APS — The message applies to the Attached Processor Interface (API) of the APS.
 - 4E,CNI — The message applies to the Common Network Interface (CNI) of the APS.
 - 4E,IMS — The message applies to the Interprocess Message Switch (IMS) of the APS.
- **TYPE** - Specifies that this is an output message.

2.4.2 Descriptive Material

In general, the descriptive material following the key block data is presented under five headings.

SEE PROPRIETARY NOTICE ON COVER PAGE

1. *Format* - Presents the message format. Output messages may have more than one format and the variations are generally presented under this heading. In some instances, the number of formats is so large that the individual format types are presented under the Variable Field Definitions heading.
2. *Reason for Output* - Explains why the message is generated.
3. *Variable Field Definitions* - Defines the variables used in the message. It may also define multiple formats for the message where a large number of them are used. This heading may also include additional explanatory text, notes, or tables needed for message interpretation. It includes additional notes or tables needed to clarify message use.
4. *Action To Be Taken* - Describes any actions that should be taken in response to the information presented in the output message.
5. *References* - Gives references to other input and / or output messages, Practices, and other related documents.

2.4.3 Acronyms and Mnemonics

Acronyms and mnemonics are used throughout the input and output manuals. Some commonly used acronyms and mnemonics are defined in Table 2-1.

Table 2-1
Acronyms and Mnemonics

AB	- Accounting Block
ABD	- Alternate Boot Disk
ABDN	- Abandon
ABM	- Accounting Block Matcher
ABR	- Auxiliary Buffer Register
ABS	- Alarm Battery Supply
ACD	- Automatic Call Distributor
ACI	- AT&T Communications Interface
ACI	- AT&T Customer Interface
ACNR	- Application Critical Node Recovery
ACP	- Action Control Point
ACR	- Auxiliary Call Register
ACT	- Active
ACT	- Automatic Test Control
ACUERR	- Automatic Call Unit Failure
AD	- Additional Data
ADB	- Advanced Debugger
ADB	- Analog Data Block
ADB	- Automatic Database Backup
ADC	- Acceptable Digit Count
ADP	- Automatic Diagnostic Process
ADR	- (Virtual) Address
ADS	- Auxiliary Data System
AG	- Alarm Grouping
AIM	- Application Integrity Monitor
AINI	- Autonomous Interrupt
ALEV	- A-Level
ALS	- Alternate Linkset
AM	- Administrative Module
AMA	- Automatic Message Accounting
ANI	- Automatic Number Identification
ANN	- Announcement
ANNUM	- Announcement Number
ANS	- Answer
AOOC	- Automatic Out of Chain
APDRV	- Attached Processor Driver

SEE PROPRIETARY NOTICE ON COVER PAGE

Acronyms and Mnemonics (continued)

API	- Attached Processor Interface
APLUPD	- Attached Processor Lamp Update Process
APMH	- Attached Processor Message Handler
APPDB	- Application Database
APPDB	- ATP Database
APPDL	- Application Data Link
APS	- Accunet® Packet Service
APS	- Attached Processor System
APUF	- Autonomous Peripheral Failure
APUT	- Autonomous Peripheral Trouble
AR	- Audible Ringing
ARR	- Automatic Re-Routing
ARR	- Automatic Ring Recovery
ASCII	- American Standard Code For Information Interchange
ASW	- All Seems Well
ASWF	- All Seems Well Failure
AT	- Alarm Transfer
ATA	- Activate Trunk Audit
ATC	- All Tests Completed
ATP	- All Tests Pass
ATP	- AT&T Trigger Platform
ATSGHC	- Adjunct Trunk Subgroup Head Cell
ATV	- AT&T Trigger Validation
AU	- Auxiliary Unit
AUB	- Auxiliary Unit Bus
AUDS	- Audit System Program
AUDST	- Audit State
AVD	- Application Variable Data
AVL	- Availability
BAL	- Blocked Address List
BB	- Billing Block
BBDIG	- Blue Box Digits
BCD	- Binary Coded Decimal
BDU	- Bus Display Unit
BEC	- Basic Error Correction
BES	- Bursty Errored Seconds
BFTIS	- Backward Failure Treatment Integrated Services Digital Network User Part
BFTNI	- Backward Failure Treatment Not Integrated Services Digital Network User Part
BIC	- Bus Interface Controller
BIMM	- Busy-Idle Memory Map
BIN	- Binary Format

SEE PROPRIETARY NOTICE ON COVER PAGE

Acronyms and Mnemonics (continued)

BKPRT	- Backup Partition
BLEV	- B-Level
BLK	- Block
BLM	- Base Level Maintenance
BMAM	- Buffer Memory Address Map
BN	- Billing Number
BPH	- Beginning Phase
BPS	- Bits Per Second
BRKREC	- Break Received
BRL	- Billing Record Length
BSDIR	- Base Directory
BSTN	- Base Traffic Number
BTFN	- Base Traffic Number
BV	- Bipolar Violation
BVR	- Bipolar Violation Rate
BWM	- Broadcast Warning Message
CAD	- Circuit Administration
CALM	- Common Alarm
CAMA	- Centralized Automatic Message Accounting
CAMA-ONI	- Centralized Automatic Message Accounting - Operation Number Identification
CANI	- Customer Automatic Number Identification
CAPPN	- Cut-Through Application Number
CAR	- Current Address Register
CAREA	- Control Area
CAROT	- Centralized Automatic Reporting On Trunks
CARRF	- Carrier Failure
CATLAS	- Centralized Automatic Trouble Locating and Analysis System
CATP	- Conditional All Tests Passed
CBC	- Call By Call Service Selection
CBNPR	- Calling Party Number / Billing Default Presentation Restriction Indicator
CC	- Call Codes
CC	- Central Control
CC	- Country Code
CCB	- Cache Control Block
CCD	- Country Code
CCFR	- Central Control Fault Recognition
CCIO	- Central Control Input/ Output
CCIS	- Common Channel Interoffice Signaling
CCIS2WRE	- Common Channel Interoffice Signaling 2Wire
CCISCR	- Common Channel Interoffice Signaling Critical Register
CCITT	- Consultative Committee on International Telephone & Telegraph

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

CCITT6	- Consultative Committee on International Telephone & Telegraph Common Channel Signaling System Number 6
CCK	- Continuity Check
CCS	- Common Channel Signaling
CCS	- Hundred Call Seconds
CCS7	- Common Channel Signaling System 7
CCU	- Central Control Unit
CDB	- Customer Data Block
CDBI	- Customer Data Block Index
CDR	- Call Detail Recording
CDR	- Channel Data Register
CDR	- Customer Data Response
CDRP	- Call Detail Recording Platform
CESR	- Control Error Source Register
CFA	- Carrier Failure Alarm
CFC	- Carrier Failure Condition
CGA	- Carrier Group Alarm
CH	- Channel

FIFO	- First-In First-Out
FLEV	- F-Level
FLN	- Frame Location Number
FMGR	- File Manager
FMI	- File Manager Interface
FMIBUF	- File Manager Interface Buffer
FPWRF	- Force Power Failure
FRZ	- Frozen State
FS	- Failed Seconds
FS	- File Store
FS	- Functional Schematic
FSECD	- File Store Error Correction Data
FSID	- File Store Identification
FSP	- Four-State Pass
FSSTAT	- File Store Status Failure Report Data
FTA	- File Transfer and Activation
FTF	- File Transfer Files
FTFN	- First Traffic Number
FTS	- Field Test Set
GBT	- General Buffer Table
GCP	- Gate Control Pulse
GCP	- Generated Control Pulse
GEN	- Generic
GEOSEP	- Geographical Traffic Separation Class
GI	- Group Interrogate
GLEV	- G-Level
GNS	- Go / No Go Screening
GNSC	- Go / No-Go Screening Class
GOOS	- Go-Out-Of-Service
GRASP	- General Access Package
GRASP	- Generic Access Package
GSDN	- Global Software Defined Network

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

GSDNPHSE	- Global Software Defined Network Phase
GSF	- Generic Specification File
GTH	- Growth
GTT	- Global Title Translation
GULP	- General Utility Program
HA	- Host Adapter
HA	- Host Adaptor
HAW	- High And Wet
HBDG	- Head Block Diode Group
HIST	- Trouble History
HLD	- Hold
HSD	- High Speed Synchronous Data Link
HSDC	- High Speed Synchronous Data Link Controller
HSR	- Hardware Status Register
HTR	- Hard To Reach
HV	- Hardware Version
HWL	- High And Wet List
HWT	- High And Wet Timing
I/O	- Input/Output
IA	- Ineffective Attempt
IADC	- Integrated Access Direct Connect
IAID	- Internal (4ESS™) Announcement Identity
IBGTT	- Inbound Global Translation
IBO	- Input Buffer Overflow
IC	- Instruction Control
IC	- Inter Local Access Transport Area Carrier
ICB	- Input Control Block
ICD	- International Call Data
ICDR	- International Call Detailed Recording
ICMP	- Internet Control Message Protocol
ICT	- Incoming Trunk
ID	- Identification
IDB	- Inward Area Telephone Service Database
IDDD	- International Direct Distance Dialing
IDENT	- Identity
IDMM	- Identification Tag Mismatch
IDS	- Information Delivery System
IDS	- Information Development Services
IDS	- Interconnection Design System
IDS	- Interprocessor Data Synchronization
IDTS	- Incoming Dial Tone Start

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

IGFET	- Insulated Gate Field Effect Transistor
IMR	- Inhibit Maintenance Request
IMS	- Interprocess Message Switch
IMSDRV	- Interprocess Message Switch Driver
IN	- Interface Node
INI	- Inhibit Normal Interrupt
INIT	- Initialization
INS	- In-Service
INSEP	- Incoming Traffic Separation Class
INTL	- International
INVCCD	- Invalid Channel Command
INVINT	- Invalid Interrupt Internal Register
INWATS	- Inward Area Telephone Service
IODRV	- Input/ Output Driver
IODRV	- Input/ Output Drivers
IOF	- Input/ Output Frame
IOMP	- Input/ Output Unit Microprocessor Communities
IOP	- Input/ Output Processor
IOUC	- Input/ Output Unit Controller
IOUS	- Input/ Output Unit Selector
IP	- In Progress
IP	- Initialization Processor
IP	- Internal Protocol
IP	- Internet Protocol
IPUB	- Interface Peripheral Unit Bus
IS	- In Service
IRN2	- Integrated Ring Node 2
ISC	- Incoming Signaling Characteristics
ISL	- Intermediate Switch List
ISTP	- International Traffic Point
ISUP	- Integrated Services Digital Network User Part
ITC	- Incoming Trunk Class
ITC	- Incoming Trunk Subgroup Class
IU	- Interface Unit
IUN	- Interprocess Message Switch User Node
IWZ1	- International World Zone 1
JCB	- Job Control Buffer
JLEV	- J-Level
KBPS	- Kilobits Per Second
KLEV	- K-Level
KOP	- Kernel Overwrite Process

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

KW	- Keyword
LACID	- Link Access Circuit Identifier
LATA	- Local Access Transport Area
LCA	- Local Carrier Alarm
LCI	- Local Call Intercept
LDIN	- Logical Device Identification Number
LDFT	- Load Disk From Tape
LEC	- Local Exchange Carrier
LFCN	- Low Frequency Exerciser Controller
LFS	- Link Fault Sectionalization
LFVR	- Line Format Violation Rate
LI	- Length Indicator
LI	- Link Interface
LIB	- Library
LIB	- Library Program
LIER	- Link Interface Encryption Removal
LIM	- Link Integrity Monitor
LIU	- Line Interface Unit
LKO	- Lockout
LLB	- Line Loopback
LLHC	- Link List Head Cell
LLSADR	- Last Look Store Address
LN	- Link Node
LODBUF	- Load Buffer
LOF	- Loss Of Frame
LOFC	- Loss Of Frame Count
LOM	- Listen Only Mode
LOS	- Loss Of Signal
LP	- Link Processor
LPA	- Low Paper Alarm
LSA	- Local Subframing Alarm
LSC	- Loopback Select Code
LSP	- Load-Set Period
LSST	- Local Access Transport Area / State Screening State
LTS	- Long Term Storage
LVS	- Local Variable Stack
LVS	- Local Variable Stock
MAC	- Machine Administration Center
MACCM	- Machine Administration Center Control Memory
MACP	- Maintenance Control Program
MAEC	- Media Access Error Counter

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

MAN	- Manual
MAPN	- Master Application Number
MAPRT	- Map Rate Table
MAR	- Mass Announcement System Register
MARP	- Maintenance Restart Program
MAS	- Mass Announcement Service Frame
MAS	- Mass Announcement Service
MASA	- Main Store Array
MASC	- Main Store Controller
MAU	- Mass Announcement Unit
MB	- Maintenance Busy
MC	- Maintenance Center
MC	- Microcode
MCC	- Master Control Center
MCH	- Maintenance Channel
MCRT	- Maintenance Cathode Ray Terminal
MCT	- Multiple Carrier Treatments
MDCT	- Minor Device Chain Table
MDN	- Miscellaneous Distribution Number
MDR	- Message Detail Recording
MEGC	- MEGACOM® Service
MEMN	- Member Number
MF	- Multifrequency
MFC	- Multifrequency Compelled
MFGR	- Manufacturer
MFN	- Maintenance File Number
MFNUM	- Maintenance File Number
MHD	- Moving Head Disk
MHD	- Moving Head Disks
MI	- Maintenance Interject
MI	- Member Interrogate
MI	- Modular Interface
MICON	- Maintenance Control
MICON	- Maintenance Interrupt Control
MIRA	- Maintenance Input Request Administrator
MJ	- Major
MJC	- Major Capabilities
MLTS	- Micro Level Test Set
MML	- Matrix Maintenance Limit
MN	- Minor
MNC	- Magic Number Control

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

MOC	- Master Operations Center
MOCC	- Master Operations Center Control
MOCT	- Measurement Output Control Tables
MOP	- Mount Off-Line Partition
MORR	- Multiple Or Redundant Request
MP	- Main Program
MP	- Maintenance Processor
MP	- Monitor
MPF	- Memory Parity Failure
MPI	- Miscellaneous Program Index
MR	- Maintenance Request
MRA	- Modify Recovery Action
MRF	- Maintenance Reset Function
MROP	- Maintenance Read-Only Printer
MRT	- Multiple Routing
MRTI	- Multiple Routing Treatment Index
MRVA	- Message Transport Part Routing Verification Acknowledgement Message
MRVR	- Message Transport Part Routing Verification Result Message
MRVT	- Message Transport Part Routing Verification Test
MS	- Main Store
MSK	- Mask
MSN	- M-Store Number
MSN	- Miscellaneous Scan Point Number
MSN	- Miscellaneous Scanner Number
MSTAT	- Mass Announcement System Status Table
MSW	- Message Switch
MSU	- Message Signal Unit
MT	- Magnetic Tape
MTC	- Magnetic Tape Controller
MTC	- Maintenance
MTCE	- Maintenance
MTP	- Message Transport Part
MTS	- Multiple Treatment Screening
MTSC	- Multiple Treatment Screening Class
MTSCI	- Multiple Treatment Screening Class Index
MTTY	- Maintenance Teletypewriter
MTTYC	- Maintenance Teletypewriter Controller
MULTACT	- Multiple Activate
MV	- Model Version
NAC	- Non-Call Associated Temporary Signaling Connection Anomaly Code
NACC	- Non-Call Associated Temporary Signaling Connection Anomaly Code Category

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

NAUD	- Node Audit
NBS	- Near Building Subdivision
NCA	- No Circuit Available
NCAT	- Non-Call Associated Temporary Signaling Connection
NCATSC	- Non-Call Associated Temporary Signaling Connection
NCD	- Network Call Denial
NCG	- Noncorrecting
NCLK	- Network Clock
NCOE	- Network Channel Office Equipment
NCP	- Network Control Point
NCSU	- Network Clock Synchronization Unit
NE	- Near End
NEI	- Network Element Interface
NEIT	- Near-End Intrusive Test
NENI	- Near-End Non-Intrusive
NEOTR	- Near Operational Test
NESAC	- National Electronic Switching Assistance Center
NETCLK	- Network Clock
NID	- Network Identification
NID	- Network Inward Dialing
NIU	- Network Interface Unit
NMOC	- Network Management Center
NNR	- Node-to-Node Registers
NOCTS	- No Clear To Send
NPA	- Numbering Plan Area
NPARINH	- Numbering Plan Area Reconstruction Inhibit
NSC	- Network Services Complex
NSN	- Network Switch Number
NTC	- National Trunk Congestion
NTPI	- Non-Trunk Program Index
NTR	- No Tests Run
NTWK	- Network
NWM	- Network Management
NWM	- Network Management Display Data
NWT	- Network Time
O/S	- Out-of-Service
OBGTT	- Outbound Global Title Translation
OBO	- Output Buffer Overflow
OC	- On Condition
OCU	- Office Channel Unit
ODA	- Office Data

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

ODA	- Office Data Assembler
ODIL	- Office Dependent Initial List
OFC	- Office
OFL	- Off-Line
OFLBOOT	- Off Line Boot
OFLDISK	- Off-Line Disk
OGT	- Outgoing Trunk
OLCIGI	- Originating Local Call Intercept Group Index
OLI	- Originating Line Information
OLIN	- Off-Line Status
OMDB	- Output Message Database
OMEG	- MEGACOM® / Wide Area Telecommunications Service
OMR	- Output Message Register
ONAC	- Operational Network Administration Center
ONI	- Operation Number Identification
ONI	- Operator Number Identification
OOF	- Out Of Frame
OOFC	- Originating Office Code
OOS	- Out Of Service
OOSI	- Out Of Service Ignore
OPC	- Originating Point Code
ORNU	- Order Number
OSC	- Outgoing Signaling Characteristics
OSDATA	- On-Site Data
OSDNK	- Global Software Defined Network Key Customer
OSM	- Operator Services Manager
OSM	- Originating Switch Module
OSOR	- On-Site Operations Report
OSS	- Operating Support System
OST	- Operating System Trap
OTMTN	- Operational Terminating Test Number
OTMTT	- Operational Terminating Test Type
OTSTN	- Operational Through Switch Test Number
OTSTT	- Operational Through Switch Test Type
OVL	- Overload
OVRD	- Override
PA	- Program Address
PALL	- Print All
PAS	- Protected Application Segment
PAS	- Protective Application Segment
PAS	- Public Announcement

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

PBC	- Peripheral Bus Computer
PBFR	- Peripheral Bus Fault Recognition
PBX	- Private Branch Exchange
PBXAW	- Private Branch Exchange Answer Withheld
PBXESGD	- Private Branch Exchange Expect Station Group
PC	- Peripheral Controller
PC	- Processor Configuration
PCB	- Process Control Block
PCCD	- Pseudo-Country Code
PCD	- Power Control Distribution
PCD	- Power Conversion and Distributing
PCF	- Point Code Format
PCGRP	- Person Command Group
PCM	- Pulse Code Modulation
PCP	- Positive Call Processing
PCPAUD	- Processor Control Process Audit
PCPGTT	- Positive Call Processing Global Title Translation
PCPMD	- Processor Control Process Maintenance Driver
PCR	- Preventative Cyclic Redundancy
PCRV	- Processor Configuration Recovery
PCS	- Power Control Switch
PCSD	- Peripheral Controller Subdevices
PDA	- Parameter Data
PDS	- Page Descriptor Shell
PDS	- Program Documentation Standard
PDT	- Page Descriptor Table
PECC	- Program Engineering Control Center
PGM	- Program
PIC	- Peripheral Interface Controller
PIC	- Priority Interrupt Controller
PID	- Process Identification
PIIT	- Periodic Indication Of Intrusive Test
PIO	- Peripheral Input / Output
PKG	- Package
PLB	- Payload Loopback
PLS	- Primary Linkset
PLS	- Pulsed Line Signaling
PMCR	- Plant Measurements Common Report
PMD	- Point Of Maximum Definition
PMJ	- Power Major
PMN	- Power Minor

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

PMOS	- Peripheral Maintenance Operating System
PMS	- Plant Measurement System
PNT	- Print
PNT	- Print No Test
POTS	- Plain Old Telephone Service
PP	- Processor Peripheral
PPI	- Processor-Peripheral Interface
PPM	- Periodic Pulse Metering
PRL	- P-Register - Lower
PRM	- Process Recovery Message
PROFL	- Profile
PRT	- Proportional Routing
PS	- Program Store
PSB	- Program Store Bus
PSBN	- Prohibit Sending Billing Number
PSBR	- Primary Segment Base Register
PSCPN	- Prohibit Sending Calling Party Number
PSES	- Prohibit Service Evaluation
PSFRID	- Program Store Identification
PSFRTR	- Program Store Test Results
PSLT	- Periodic Signaling Link Test
PSM	- Power Switch Monitor
PSN	- Protection Switch
PSOLI	- Prohibit Sending Originating Line Information
PSS	- Program Store Semi-Conductor
PSS	- Program Support System
PSSWDPFX	- Password Prefix
PSSWDSFX	- Password Suffix
PSUUI	- Prohibit Sending User-To-User Information
PSW	- Processor Status Word
PSW	- Program Status Word
PSW	- Protection Switch
PTSRPS	- P-bit Trunk Status Rate Pointer Store
PTSS	- P-bit Trunk Status Store
PU	- Peripheral Unit
PUB	- Peripheral Unit Bus
PUC	- Peripheral Unit Controller
PUCF	- Peripheral Unit Controller Frame
PUEX	- Peripheral Unit Exercise
PULP	- Peripheral Utility Program
QTFN	- Quantity Of Traffic Numbers

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

QTFN	- Quantity Traffic Numbers
RA	- Recorded Announcement
RAC	- Ring Access Circuit
RACF	- Recorded Announcement Channel Frame
RACHAN	- Record Announcement Channel
RAM	- Random Access Memory
RAC	- Ring Access Circuit
RBA	- Recent Change Rollback
RC	- Recent Change
RCMA	- Recent Change Memory Administration
RCNHIST	- Recent History
RCRB	- Recent Change Rollback
RCS	- Routine Class Schedule
RCUERR	- Automatic Call Unit Failure
RCV	- Recent Change And Verify
RDB	- Routing Data Block
RDBI	- Routing Data Block Index
RDC	- Red-Special Circuit
REG	- Register
RENI	- Remote Non-Intrusive
REV	- Reverse
REX	- Routine Exercise
RFA	- Ring Forward Allowed
RFE	- Removed Far End
RFMP	- Ring Forward Miscellaneous
RID	- Record Identification
RID	- Record Identifier
RLS	- Release
RMA	- Remote
RMA	- Remote Alarm
RMSD	- Remote Measurement System Digital
RMT	- Remote Terminal Output
RN	- Ring Node
RNA	- Ring Node Address
RNE	- Removed Near End
RO	- Read Only
ROM	- Read only Message
ROP	- Read Only Printer
ROP	- Receive-Only Printer
ROS	- Request Out of Service
ROTL	- Remote Office Test Lines

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

RPC	- Ring Peripheral Controller
RPCN	- Ring Peripheral Controller Node
RPI	- Routing Pattern Identity
RR	- Recording Register
RRM	- Routing Request Message
RSA	- Remote Subframe Alarm
RSF	- Ring Service Failure
RST	- Restore
RSW	- Receiver-Seems-Well
RT	- Ringing And Tone Plant
RTC	- Real Time Clock
RTM	- Real Time Monitor
RTNR	- Real Time Network Routing
RTR	- Real Time Reliable
RTS	- Real Time Status
RTS	- Real Time Status Report
RTSM	- Receive Time Slot Memory
RW	- Read / Write
SADC	- Special Access Data Channel
SADC	- System Audit Of Disks
SADK	- System Audit Disk
SAPN	- Slave Application Number
SAR	- Start Address Register
SAS	- Stop And Switch
SAST	- System Audit Of Stores From Tape System Audit Of Stores Using Tape
SAT	- Satellite
SAT	- Store Address Translation
SAT	- Store Address Translator
SAWS	- System Audit Of Writable Stores
SBUS	- Small Computer System Interface Bus
SBY	- Stand-By
SC	- Structure Codes
SCA	- Save Current Address Register
SCAR	- Stable Call Accumulation Register
SCC	- Switching Control Center
SCCP	- Signaling Connection Control Part
SCCS	- Switching Control Center System
SCGA	- Software Carrier Group Alarm
SCHD	- Schedule
SCLK	- System Clock
SCMG	- Signaling Connection Control Part Management Message

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

SCP	- Scan Matrix Pack
SCP	- Software Change Package
SCSD	- Scanner and Signal Distributor
SCSDC	- Scanner and Signal Distributor Controller
SCSI	- Small Computer System Interface
SCUFS	- Scanner Control Unit Failure Summary
SD	- Scan and Signal Distributor
SD	- Schematic Drawing
SD	- Segmentation Directory
SD	- Signal Distributor
SDC	- Service Degrading Condition
SDC	- Store Data Control
SDL	- Synchronous Data Link
SDLC	- Synchronous Data Link Controller
SDM	- Signal Distributor Matrix
SDN	- Software Defined Network
SDN	- Switched Digital Network
SDNK	- Software Defined Network Key Customer
SDP	- Signal Distributor Applique Pack
SDS	- Shared Data Segment
SDT	- Segment Descriptor Table
SEGINIT	- Segment Initialization
SERPF	- Serial Parity Failure
SES	- Severely Errored Seconds
SG	- System Generation
SIC	- Service Indicator Code
SICO	- Software Integrity Control Program
SID	- Service Identification
SIGLK	- Signaling Link
SII	- Service Identity Index
SIM	- System Integrity Monitor
SIN	- Small Computer System Interface Interface Node
SINDEX	- Sampling Rate Index
SINT	- Supplementary Interrupt
SIOF	- System Integrity Output Formatter
SJB	- Small Computer System Interface Job Block
SKPBY	- Skip Busy
SLC	- Signaling Link Code
SLIPS	- Slip Seconds
SLK	- Signaling Link
SLMK	- Signaling Link Monitor Kernel

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

SMCC	- Switching Maintenance Control Center
SMD	- Storage Module Drive
SMM	- Standard Main Memory
SO	- Switching Office
SOI	- Start Of Input
SP	- Scan Point
SP	- Signaling Point
SP	- Signaling Processor
SPC	- Signaling and Permuting Circuit
SPC	- Switching and Permuting Controller
SPF	- Signal Processor Failure
SPSTS	- Signal Processor State Translator Store
SR	- Software Release
SR	- System Recovery
SR	- System Reinitialization
SREC1	- Secondary Record Channel
SRES	- Search Results Number
SRST	- Signaling Route Set Test
SRVT	- Signaling Connection Control Part Routing Verification Test
SSBR	- Secondary Source Base Register
SSN	- Subsystem Network
SSR	- System Status Register
STBY	- Standby
STF	- Some Tests Failed
STF-BOF	- Some Test Failed and Buffer Overflowed
STP	- Signaling Transfer Point
STP	- Some Tests Passed
SU	- Signal Unit
SU	- Switch Unit
SUERM	- Signal Unit Error Rate Monitor
SVC	- Service Circuit
SVCT	- Service Circuit Test
SVR	- Select / Verify
SW	- Switch
SXS	- Step-by-Step
SYN	- Synchronous
SYNC	- Synchronous
SYUP	- System Update
TAC	- Terminal Access Circuit
TAN	- Trunk Appearance Number
TANTOTAN	- Trunk Appearance Number-to-Trunk Appearance Number

Table 2-6
Acronyms and Mnemonics (continued)

TAS	- Tape Administration System
TAT	- Test Access Trunk
TAUTH	- Terminal Authority
TB	- Transaction Block
TBMN	- Trunk Block Member Number
TBS	- Trunk Block Status
TCA	- Trunk Control Area
TCAP	- Transaction Capability Application Part
TCB	- Task Control Block
TCGRP	- Terminal Command Group
TCP	- Transmission Control Protocol
TDA	- Translation Data
TDAS	- Traffic Data Administration System
TDASMC	- Traffic Data Administration System Measurement Class
TDCU	- Traffic Data Concentrator Unit
TDEST	- Type Of Destination
TDN	- Time Division Network
TEC	- Terminal Equipment Center
TEC	- Test Equipment Control Terminal Process
TER	- Terminal
TERA	- Trunk Error Analysis
TESTNO	- Test Number
TFG	- Type Of Feature Group
TFN	- Traffic Number
TFNB	- Traffic Number Blocks
TFP	- Transfer Prohibited
TG	- Trunk Group Location Data Base
TGR	- Terminal Grouping
TGRF	- Terminal Grouping Frame
TIC	- Translation Integrity Check
TKMTC	- Trunk Maintenance
TL	- Terminate and Leave
TLDB	- Trouble
TLP	- Trouble Locating Procedure
TLP	- Trouble Location Procedure
TM	- Timer
TMR	- Timer Register
TMR	- Trunk Maintenance Register
TMS	- Time Multiplexed Switch
TMSCR	- Time Multiplexed Switch Register
TMSP	- Time Multiplexed Switch Pair

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

TN	- Terminating Number
TNUP	- Trunk Used For Large-Scale Nailup
TOC	- Trunk Operations Center
TOD	- Time Of Day
TOP	- Tape-Only Program
TOPS	- Task Oriented Procedures
TORIG	- Type Of Origin
TOSL	- Trunk Out Of Service List
TOSS	- Teleconferencing Operator Support System
TOT	- Type of Trunk
TPC	- Translation Point Code
TPI	- Trunk Program Index
TPM	- Traffic and Plant Measurement
TPM	- Traffic Plant Measurement
TPT	- Test Progress Tone
TQU	- Trunk Query
TR	- Trunk Register
TRANS	- File Store Transient Data
TRANSP	- Transparent
TRAPN	- Trap Number
TRC	- Timed routine Coordinator
TRF	- Traffic
TRIDX	- Trunk Reservation Index
TRK	- Trunk
TRNUM	- Trouble Report Number
TRPF	- Transmit Parity Failure
TSC	- Technical Service Capability
TSF	- Total Signal Failure
TSG	- Trunk Subgroup
TSGBBC	- Trunk Subgroup Broadband Capability
TSGHC	- Trunk Subgroup Head Cell
TSGHS	- Trunk Subgroup Headcell-Trunk Status
TSGN	- Trunk Subgroup Number
TSI	- Time Slot Interchange
TSIF	- Time Slot Interchange Frame
TSMEM	- Trunk Status Memory
TSN	- Trunk Scanner Number
TSP	- Translation Signaling Point
TSS	- Trunk Status Store
TST	- Test (verb)
TST	- Timed Strategy

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

TST	- Trunk Scanner Tag
TSTADR	- Test Address
TSTPAT	- Test Pattern
TSVC	- Type Of service
TSW	- Transmitter Seems Well
TSW	- Trunk Scanner Word
TSW	- Trunk Status Word
TTF	- Toll Termination Frame
TTS	- Toll Terminating Switch
TTS	- Toll Terminating Switches
TTSI	- Toll Terminating Switch Index
TTSM	- Transmit Time-Slot Memory
TTY	- Teletypewriter
TTYC	- Teletypewriter Controller
TU	- Tape Unit
TU	- Trunk Unit
TUC	- Tape Unit Controller
TURNUPC	- Turn-Up For Control Office Trunk
TURNUPN	- Turn-Up For Noncontrol Office Trunk
TUT	- Trunk Under Test
TVMASR	- Televote Master
TWRP	- Tape Writing Program
UAS	- Unavailable Seconds
UAV	- Unavailable
UC	- Utility Circuit
UCB	- Unit Control Block
UCL	- Unconditional
UDPC	- Unknown Destination Point Code
ULN	- Universal Link Node
UMEM	- Utility Memory
UNAS	- Unassigned
UNEQ	- Unequipped
UNEQIP	- Unequipped
UNITNO	- Unit Number
UNLBUF	- Unload Buffer
UPA	- Upper Protect Address
UPD	- Update
USN	- U-Store Number
USN	- Universal Scanner Number
USTATUS	- Unit Status
UTILDS	- Utility Data Sets

SEE PROPRIETARY NOTICE ON COVER PAGE

Table 2-6
Acronyms and Mnemonics (continued)

UTL	- Utilities
UTMN	- Unit Type and Member Number
UVDT	- User View Descriptor Table
VCNT	- Vacant Code Analysis
VDCAP	- Voice/Data Capability
VF	- Voice Frequency
VFL	- Voice Frequency Link
VIC	- Voice Interface Controller
VIF	- Voiceband Interface Frame
VIFCR	- Voiceband Interface Frame Critical
VIU	- Voiceband Interface Unit
VLMM	- Very Large Main Memory
VPA	- Voice Path Assurance
VSN	- Volume Serial Number
VSS	- Voice Storage System
VSSID	- Voice Storage System Identification
VTOC	- Volume Table of Contents
WATS	- Wide Area Telecommunications Service
WATSBN	- Wide Area Telecommunications Service Billing Number
WER	- Write Enable Ring
XC	- Transceiver
XCPA	- Transceiver Pad Adjustment
XTMTN	- Transmission Terminating Test Number
XTMTT	- Transmission Terminating Test Type
XTSI	- Expanded Time Slot Interchange
XTSTN	- Transmission Through Switch Test Number
XTSTT	- Transmission Through Switch Test Type

Issue 9.4
July 2002

SECTION 3

INDEX

3.1 INTRODUCTION

This section contains the indexes for output messages in volumes one through four. The messages are listed in alphabetical order by message ID with the associated message name and generic.

3.2 VOLUME 1 ALPHABETICAL INDEX

MESSAGE NAME	MESSAGE ID	START GENERIC	ISSUE
ABORT LFS	ABORT:LFS	4AP12	9.0
ACTV DCC	ACTV:DCC	4AP12	9.0
ACTV OMDB	ACTV:OMDB	4AP12	9.0
ALW ADB	ALW:ADB	4AP12	9.0
ALW AMA SSPUNAS COMPLETED	ALW:AMA-SSPUNAS	4AP12	9.0

ID ABORT:LFS
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,CNI
TYPE Output

1. FORMAT

ABORT LFS COMPL
LFS a b c {NEAR|FAR} AT d ABORTED
TERMINATED BY ABORT MESSAGE

2. REASON FOR OUTPUT

Prints in response to input message ABORT:LFS.

3. VARIABLE FIELD DEFINITIONS

- a Link group number (0-63).
- b Link member number (1-15).
- c Number of loopback components specified in the EXC:LFS command line.

TEST sequence progression specifier:

NEAR — Indicates link fault sectionalization (LFS) test started from the nearest specified loopback component to the farthest.

FAR — Indicates LFS test started from the farthest specified loopback component to the nearest.

- d Loopback point to which the test sequence has progressed:
 - CSUL — Channel service unit (CSU) latching loopback.
 - CSUN — Channel service unit (CSU) non-latching loopback.
 - DPuu — Indicates the uuu'th digital signal zero (DS0) data port relative to the near-end. The uu is a number in the range: (01-99).
 - DSUL — Data service unit (DSU) data port latching loopback.
 - DSUN — Data service unit (DSU) non-latching loopback.
 - LID0 — Indicates test sequence has not progressed beyond the local loopback test.
 - NEI — Far-end network element interface. (Loopback select code octet value = x1000001).
 - OCUL — Office channel unit latching loopback.
 - OCUN — Office channel unit non-latching loopback.

SEE PROPRIETARY NOTICE ON COVER PAGE

REM — Manual remote loopback.

RPT1 — Represents non-latching loopback test for the first 56K bps local loop regenerative repeater.

RPT2 — Represents non-latching loopback test for the second 56K bps local loop regenerative repeater.

ABORTED Indicates the LFS test terminated abnormally at the loopback point corresponding to the loopback point listed in the message.

4. ACTION TO BE TAKEN

None.

ID ACTV:DCC
WORK CENTER.. MOC
GENERIC 4AP12 Rel. 4 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

- [1] ACTV DCC APP a SID b COMPLETE
APPDB DCC IS BEING ACTIVATED -- PLEASE WAIT
- [2] ACTV DCC APP a SID b COMPLETE
APPDB DCC IS ACTIVATED FOR a
- [3] ACTV DCC APP a SID b COMPLETE
APPDB DCC IS ACTIVATED FOR a - MANUAL ACTION IS NECESSARY
- [4] ACTV DCC APP a SID b COMPLETE
APPDB DCC IS ALREADY ACTIVATED FOR a
- [5] ACTV DCC APP a SID b COMPLETE
APPDB DCC CANNOT BE ACTIVATED FOR a -- DCC IS INHIBITED
- [6] ACTV DCC APP a SID b COMPLETE
APPDB DCC CANNOT BE ACTIVATED FOR a -- COPY:APPDB IN PROGRESS
- [7] ACTV DCC APP a SID b COMPLETE
APPDB DCC CANNOT BE ACTIVATED FOR a -- APPDB AUDIT ERRORS
- [8] ACTV DCC APP a SID b COMPLETE
INPUT ERROR - c
- [9] ACTV DCC APP a SID b COMPLETE
ERROR d (LINE e) -- APPDB DCC FOR a CANNOT BE ACTIVATED

2. REASON FOR OUTPUT

Response to the ACTV:DCC input command. Format 1 prints if no errors were encountered when executing the activate command and the "copy to scratch" task has been started. Either format 2 or 3 will print when the "copy to scratch" task is completed. Formats 1 and 2 will normally print as a result of the same input command. Format 3 prints if the "copy to scratch" task is successful, however errors were detected in postprocessing work (re-allowing APPDB RCV and APPDB audits) and manual action is necessary to correct the situation. Formats 4 thru 7 print if system conditions do not allow DCC to be activated. Format 8 prints if a syntax error was found in the ACTV:DCC command that was input. Format 9 prints if internal errors are preventing the 4ESS Switch from activating DCC.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|--|
| a | The name of the APPDB customer unit being activated. Currently, only IBGTT is supported by the DCC capability. |
| b | Snapshot ID specified with ACTV:DCC input command. |
| c | English description of the syntax error found in the command input. |
| d | Error number (TBD). |
| e | Source line number where error was found. (For NESAC trouble-shooting.) |

4. ACTION TO BE TAKEN

Format 3: In order to properly "copy to scratch" the APPDB active database, the ACTV:DCC software must first inhibit APPDB RCV and APPDB audits, if they are currently allowed. When the "copy to scratch" task is completed, APPDB RCV and audits must be returned to their allow/inhibit states prior to the ACTV:DCC command. If errors are detecting during this cleanup process, format 3 is output. Craft of the OSS may need to do either ALW:RCV,APP IBGTT:APPDB or ALW:DLNAUD,APP IBGTT;AUD ALL, whichever is appropriate.

Format 5: DCC cannot be activated if it is already active. If another activation (copy to scratch) is desired, DCC must first be deactivated (see DEACTV:DCC) for the particular APPDB customer unit.

Format 6: Retry later.

Format 7: DCC will not activate if APPDB audits are detecting errors in the master copy of the database. These audit errors will need to be resolved before DCC can be activated for the particular APPDB customer unit.

Format 7: Notify NESAC.

APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] ACTV OMDB COMPLETED
OMDB SEGMENTS:
TOTAL ACTIVE
a b
- [2] ACTV OMDB FAILED
- [3] ACTV OMDB ABORTED
UNABLE TO SEND REQUEST TO CSOP

2. REASON FOR OUTPUT

To report the completion of processing an ACTV:OMDB input message to refresh the active (incore) Output Message Data Base.

3. VARIABLE FIELD DEFINITIONS

- a Total number of segments that the OMDB requires.
- b Number of segments that are active (incore).

4. ACTION TO BE TAKEN

For format 2, REPT:CSOP message(s) found in the ROP output preceding this message should give more information about the nature of the error. If they indicate that the file /cft/spl/omdb is not accessible, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the OP:ST-LSTDIR command for /cft/spl/omdb. If neither of these actions determines a probable cause, there may be insufficient memory available to bring a fresh copy of the OMDB incore.

For format 3, verify that the Craft Output Spooler (CSOP) is running.

5. REFERENCES

OMDB Keys

Format 1 has an OMDB key of 1.

Format 3 has an OMDB key of 118.

REASON: NODE IS NOT ACTIVE
- [6] ALW DCNAUD a {LNb c | ALL} FAILED
REASON: SEND MSG TO DCHAN FAILED
- [7] ALW DCNAUD a LNb c FAILED
REASON: RECEIVED _RTNMSG OR _SRCMATCH MSG

2. REASON FOR OUTPUT

To report the termination status of the ALW:DCNAUD input message.

3. VARIABLE FIELD DEFINITIONS

- a Audit member. One of the following:
 - 1 — Data Blocks audit.
 - 2 — User call reference value (CRV) Table audit.
 - 3 — Network CRV Table audit.
 - 4 — Channel ID Table audit.
 - 5 — Idle Data Blocks List audit.
 - ALL — All DCN audits.
- b DCN group number.
- c DCN member number.

SEE PROPRIETARY NOTICE ON COVER PAGE

ALL	All DCN nodes.
d	Audit allow status for all audits controlled by D-Channel Node (DCN). One of the following: ALLOWED ALREADY ALLOWED

4. ACTION TO BE TAKEN

Format 1 indicates successful execution. No action is necessary.

Format 2 indicates that the Audit Control Mechanism on the DCN is under initialization. Wait until the DCN finishes initialization and retry.

Format 3 indicates that the audit number is not valid. Retry with a correct audit number.

Format 4 indicates that the requested node is not a DCN. Retry with a correct group and member number for the DCN.

Format 5 indicates that the DCN is not active. Wait until DCN is active and retry.

Format 6 indicates that DCNAP can not send message to the DCN. Retry. If you get the same error multiple times, seek technical assistance.

Format 7 indicates that DCNAP received a returned or source matched message. Either the IMS channel is not open on the DCN or the DCN is not active.

- [1] ALW DMQ COMPLETED
- [2] ALW DMQ SOURCE a IS NOT INHIBITED
- [3] ALW DMQ SOURCE a IS INHIBITED BY SOURCE ALL
- [4] ALW DMQ ENABLED a

2. REASON FOR OUTPUT

Format 1 indicates that an ALW:DMQ input message has completed.

Format 2 indicates that an ALW:DMQ input message was entered for a non-inhibited source.

Format 3 indicates that an ALW:DMQ input message was entered for a source inhibited by ALL. A source cannot be allowed if the source ALL is inhibited.

Format 4 reports that a specific source of automatic maintenance requests is no longer inhibited. It is now allowed to send requests to the Maintenance Input Request Administrator (MIRA).

3. VARIABLE FIELD DEFINITIONS

- a Three-character name of the source currently allowed to make automatic maintenance requests:
 - ADP — Automatic diagnostic process.
 - ALL — Allows all automatic maintenance requests by clearing the inhibited sources that were inhibited by ALL.
 - REX — Routine exercises.

4. ACTION TO BE TAKEN

Use the OP:DMQ input message to determine which diagnostic sources are inhibited.

TYPE Output

1. FORMAT

- [1] ALW EAIINT a COMPLETED
- [2] ALW EAIINT a COMPLETED WITH b
- [3] ALW EAIINT a ABORTED c

2. REASON FOR OUTPUT

To indicate the result of a request to allow Emergency Action Interface (EAI) error interrupts on a specified 3B21D computer Control Unit (CU), or on both 3B21D computer CUs.

NOTE: The 3B20D/3B21D computer CUs do not have EAI error interrupts.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

3. VARIABLE FIELD DEFINITIONS

- a CU 0, CU 1, or CU 0 and CU 1.
- b Port problems:
 - AN INVALID SYSTEM PORT SPECIFIED
 - AN INVALID SYSTEM PORT SPECIFIED FOR AIM— Application Integrity Monitor (AIM)
 - NO PROCESS ATTACHED TO THE SPECIFIED PORT
 - NO PROCESS ATTACHED TO THE AIM PORT
- c Error codes:
 - 50 — Message could not be sent to a driver or Real Time Status (RTS) report.
 - 51 — Equipment Configuration Database (ECD) access function completed unsuccessfully.
 - 52 — Error in message communication.
 - 53 — Error internal to the inhibit administrator.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Format 1, no action is necessary.

For Format 2, seek technical assistance.

For Format 3, use the **OP:ERRCHK** input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

ID ALW:FTA
WORK CENTER.. MOC
GENERIC 4AP12 Rel. 4 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

This message has four formats.

- [1] ALW FTA APP a COMPLETE
FTA IS ALLOWED FOR a
- [2] ALW FTA APP a COMPLETE
REMOTE EXECUTION OF THIS COMMAND NOT ALLOWED
- [3] ALW FTA APP a COMPLETE
INPUT ERROR - d
- [4] ALW FTA APP a COMPLETE
ERROR b (LINE c) -- FTA CANNOT BE ALLOWED FOR a

NOTE: If the APP keyword argument was not specified in the corresponding IM message, the preceding formats will be slightly different. An Output Message will print, with "IN PROGRESS" on the first line instead of "COMPLETE", for each application programmed for FTA. A final "COMPLETE" message will print concluding the Output Message sequence. For example, instead of format 1 preceding, the output will be:

ALW FTA IN PROGRESS
APPDB FTA IS ALLOWED FOR IBGTT

ALW FTA IN PROGRESS
APPDB FTA IS ALLOWED FOR OBGTT

ALW FTA IN PROGRESS
APPDB FTA IS ALLOWED FOR CORE

ALW FTA COMPLETE

Currently, the "Inbound GTT", "Outbound GTT", and "Core" (i.e., PCP and ATP) applications are programmed to use FTA.

2. REASON FOR OUTPUT

Response to the File Transfer and Activation (FTA) ALW:FTA input command. Format 1 prints if no errors were encountered when executing the allow (ALW:FTA) command. Format 2 prints if the ALW:FTA command is requested via a remote login connection (e.g., via IRAS PINET session). Format 3 prints if a syntax error was found in the ALW:FTA command that was input. Format 4 prints if internal errors are preventing the 4ESS™ Switch from allowing FTA.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a The customer application specified in the ALW:FTA input message.
Either:
- IBGTT
OBGTT (Refers to the PCP customer)
CORE
- b Error number (TBD).
- c Source line number where error was found. (For NESAC trouble-shooting.)
- d English description of the syntax error found in the command input.

4. ACTION TO BE TAKEN

Format 4: Notify NESAC.

ID ALW:RCV-APPDB
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

This message has four formats.

- [1] ALW RCV APPDB ACTIVE
- [2] ALW RCV APPDB CANNOT CLEAR LOCK - REASON a
- [3] ALW RCV APPDB RETRY LATER - CANNOT CONNECT TO DATABASE
- [4] ALW RCV APPDB CANNOT TALK TO DATABASE

2. REASON FOR OUTPUT

These output messages are printed as a direct result of the ALW:RCV-APPDB input message. Format 1 prints if the "DLN Inhibit" feature has been deactivated with no problems. GTT10D RCV is now allowed.

Format 2 prints if a system error is encountered while trying to deactivate the inhibit. The "DLN Inhibit" is STILL in effect.

3. VARIABLE FIELD DEFINITIONS

a System error code. See Output Appendix APP:SYSERR.

4. ACTION TO BE TAKEN

No action required for Format 1.

If Format 2 prints, determine if system conditions indicate that trouble with 3B disk access is expected. If such trouble is NOT expected, notify NESAC.

If Format 3 prints, the input message cannot establish a communication link with the RCV process. Probable cause: the RCV process does not exist or insufficient system resources are available for the operation. Wait and retry later.

If Format 4 prints, the input message has established a communication link with the RCV process, however, no data can be sent or received. Probable cause: the RCV process has a software problem or insufficient system resources are available for the operation. Wait and retry later. If the problem does not clear, notify NESAC.

SEE PROPRIETARY NOTICE ON COVER PAGE

[14] ALW RUTILFLAG ABT
KERNEL RESPONSE TIMEOUT d

2. REASON FOR OUTPUT

Response to a ALW:RUTIL input command.

Formats [1] and [2] indicate a successful completion of the ALW:RUTIL and the ALW:RUTIL with the FLAG option input commands, respectively.

Format [3] indicates that the breakpoint specified is invalid.

Format [4] indicates that the specified breakpoint in not set up.

Format [5] indicates that the breakpoint has an illegal status.

Format [6] indicates that a memory protection error has occurred.

Formats [7] and [8] indicate that creating the special file for the kernel has failed.

Formats [9] and [10] indicate that attempting to open the file for the kernel processing has failed.

Formats [11] and [12] indicate that the kernel has returned a failing return code.

Formats [13] and [14] indicate that the kernel has not responded to the craft process.

3. VARIABLE FIELD DEFINITIONS

aa	The group number of the concerned node.
b	The member number of the concerned node.
c	The specified breakpoint number.
d	The value of the global variable errno.
e	Illegal breakpoint status value.
f	Memory protection error return.

4. ACTION TO BE TAKEN

For Formats [3] and [4], check the specified breakpoint number.

Otherwise seek technical assistance for Formats [5] through [14].

ID ALW:SCSD
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] ALW SCSD UNIT a PT b[bbbbbbb] c
- [2] ALW SCSD GRPN d DUPID e PT f[ffffff] c
- [3] ALW SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS

2. REASON FOR OUTPUT

To indicate whether a scan point has been enabled as a result of executing an ALW:SCSD input message. This allows a scan point transition to be reported.

Format 1 is used when a scan point is identified by physical location.

Format 2 is used when a scan point is identified by logical address.

Format 3 is used when the Scanner and Signal Distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

- a Member number of SCSD unit.
- b Physical scan point number on an SCSD (0-47).
- c Termination status:
 - COMPLETED — Action completed.
 - FAILED — Action could not be completed by SCSD Administrator. Reasons for failure are:
 - SCSD unit number is invalid.
 - Point number is invalid for the logical group.
 - Logical group name is invalid and either the SCSD unit is Out Of Service (OOS) or is in an inactive state to the SCSD Administrator.
- d Name of the logical group.
- e Duplex group ID (0 or 1).
- f Number of a point within a logical group.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Issue the OP:00S input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter Recent Change And Verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the results are negative, seek technical assistance.

2. REASON FOR OUTPUT

This output message is in response to an ALW:TRAP input message.

Format 1: This format results when ID ALL is specified and there are no inhibited or pending traps in the Message Trap system.

Format 2: This format results when ID ALL is specified and there is one or more inhibited or pending traps to be allowed. A list of the trap IDs that have been allowed will be displayed.

Format 3: This format results when ID ALL is specified and there is one or more inhibited or pending traps to be allowed. However, the processing of the ALW:TRAP input message has failed due to the reason being printed.

Format 4: When one or a list of trap IDs is given, each trap specified will be allowed in the given order. This format will be printed for the traps that have been successfully allowed. One message per trap ID allowed will be printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5: When one or a list of trap IDs is given, each trap specified will be allowed in the given order. In this case, one of the trap IDs given belongs to a trap that has aborted or has completed. A new trap is started with the same trap information as the one specified and a new trap ID is assigned. OID denotes the old trap ID whereas NID denotes the new trap ID. One message per ID allowed will be printed. Note that the "old" trap will remain intact.

Format 6: When one or a list of trap IDs is given, each trap specified will be allowed in the given order. This format results when the processing of a trap has failed due to the reason being printed. One message per ID failed will be printed.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|--|
| a | Trap Identification Number. |
| b | Reason ALW:TRAP input message failed (internal error condition).

CAN'T GET INDEX

INVALID TRAP STATE

NO TRAP ALLOWED |
| c | Reason ALW:TRAP input message failed.

ACT TRAP — Cannot allow active traps.
INVALID ID — ID does not belong to any trap.
MAX_SIMTRP REACHED — Maximum number of simultaneous traps
that are allowed on the Message Trap
system is reached.

TRM TRAP — Cannot allow terminated traps. |

4. ACTION TO BE TAKEN

Formats 1, 2, 4, and 5: None.

Format 3: Seek technical assistance.

Format 6: If any of the reasons in category b are printed, seek technical assistance; otherwise, the reasons in category c are self-explanatory.

5. REFERENCES

GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

ALW UMEM a WAS b NOW c #d

2. REASON FOR OUTPUT

To report the disposition of an ALW:UMEM input message.

3. VARIABLE FIELD DEFINITIONS

- a Status of the operation:
- COMPLETED — The trace has begun monitoring the flow of execution.
- NOT STARTED — The operation was ignored because data loss might have resulted.
- STOPPED UCERR — The operation could not be completed because the utility circuit either does not respond or does not match the circuit present when the trace was defined.
- b The state of the trace before the operation was attempted:
- DUMPED — The trace was not running and its data had already been dumped.
- NEW — The trace was not running and did not have data.
- RUNNING — The trace was collecting data.
- STOPPED — The trace was not running and did have data.
- UNDEF — No trace was defined.
- c The state of the trace after the operation was attempted.
- RUNNING — The trace is collecting data.
- STOPPED — The trace is stopped and does contain data.
- UNDEF — No trace is defined.
- d Generic Access Package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If the status of the operation is NOT STARTED, the trace must be in the NEW or DUMPED state in order to be started. Use the INH:UMEM and/or the OP:UMEM input messages before reissuing the ALW:UMEM input message.

If the status of the operation is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

2. REASON FOR OUTPUT

To print trouble location information after a diagnostic has been run.

Format 1 is always printed after a failure has occurred during the execution of a diagnostic.

Format 2 is printed only when diagnostic failures have occurred and the Trouble Locating Procedure (TLP) option was specified in the input command.

3. VARIABLE FIELD DEFINITIONS

- a Name of unit that failed its diagnostic (for example, RPCN00 0, or LN63 15).
- b Failing diagnostic phase number.
- c An 8-byte hexadecimal field which represents the failing keys - word 1. One bit set for each of the failing TLP keys, 0-31.
- d An 8-byte hexadecimal field which represents the failing keys - word 2. One bit set for each of the failing TLP keys, 32-63.
- e First failing key number (0-63).
- f Unique decimal number identifying the TLP process.
- g Circuit pack code.
- h Group number of group-member identification of a ring node.
- i Member number of group-member identification of a ring node.

SEE PROPRIETARY NOTICE ON COVER PAGE

j	A controller number that identifies a group of circuit packs at a ring node. The suspect board is within that controller group. If j contains a dash, the controller field does not apply to the particular circuit pack entry.
k	The position of a suspect board within a group of identical boards on the specified controller group (for Smart Node 1 applications), or the position of the suspect board within a group of identical boards within a node unit when there is no value specified for the CONT field (for applications that provide two link interface boards per node). If this variable contains a dash, the position field does not apply to the particular circuit pack entry.
l	A number (1-10) expressing the confidence level (weight) for the specified pack relative to the other suspect packs. Pack codes with larger weights are more suspect than those with smaller weights.
m	A note number, as defined in Table 1. A dash in this field specifies the absence of a note number for this pack entry.

TABLE 1

Note Number	Definition
NOTE 0	A null note.
NOTE 01	The power converter supplying any of the nodes identified in the TLP output may be faulty or powered down.
NOTE 02	The UN9 board at the DSCH may also be faulty.
NOTE 03	If a ring bus cable is associated with any of the listed nodes, that cable is also implicated as a possible cause of the diagnostic failure.
NOTE 04	CAUTION: This node is either the BISO or EISO node and so is in the active ring. The node must be removed from service, and if an IRN, it must be isolated before replacing this circuit pack.
NOTE 05	Any of the equipped memory controller packs (MASC) may be faulty.

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (Cont.)

Note Number	Definition
NOTE 06	The ring related hardware in the other nodes in the isolated segment, especially the neighbor nodes, may also be suspect if replacement of the other boards on the suspect board list fails to correct the problem. Ring hardware includes IRN, RI0, RI1 and IFB circuit packs and cabling.
NOTE 07	The problem may be due to a backplane bus fault which can be caused by a bus driver or receiver on any of the packs in the node or by a short on the backplane pins. When the fault is not cleared by the items listed on the suspect pack list, replace, one at a time, the remaining packs in the node under test and check the backplane for shorted pins.
NOTE 08	The failure is due to corruption of the data in flash (non-volatile) memory. Run diagnostic phase 51 to reprogram the flash memory on the LID0 circuit pack.
NOTE 09	One or more of the following may also cause failure: • Faulty hardware associated with the composite clock input such as cabling, or the timing signal generator. • Faulty DS0 data cabling, or the associated dataport in the channel bank. • The transmission equipment may not be configured for the same timing source as the TN1669 (both must be externally timed by the composite clock). • The "equipage" field for this node in the Equipment Configuration Database (ECD) may not be set to match the actual link hardware configuration.
NOTE 10	One or more of the following may also cause failure: • Faulty V.35 applique on the backplane. • Bad cabling between the applique and the dataset. • The dataset may be faulty or have incorrect mode settings. • The "equipage" field for this node in the Equipment Configuration Database (ECD) may not be set to match the actual link hardware configuration.

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (Cont.)

Note Number	Definition
NOTE 39	A null note.
NOTE 40	One or more of the following may be faulty: Interface between LI4 and Facility Interface, Applique board, Associated cabling, Data Set is faulty or is not in a correct mode.
NOTE 41	One or more of the following may be faulty: Interface between LI and Facility Interface, Facility Interface equipment, Associated cabling, Data set or VFLA if applicable.

4. ACTION TO BE TAKEN

Repair the faulty unit using the suspected pack list. The pack list is ordered with the most likely pack listed first.

Note: The TLP is valid for the first failing phase only.

2. REASON FOR OUTPUT

To print trouble location information for a failing diagnostic.

Format 1 is always printed after diagnostic failures have occurred. This message summarizes the failing Trouble Locating Procedure (TLP) key information for each failing phase.

Formats 2 and 4 are printed only when diagnostic failures have occurred and the TLP option was specified in the input command. The information in these messages is used to repair the failing unit.

Format 3 is to verify if TLP NOTE 4 is present. Before replacing the equipment associated with NOTE 4, contact 3B/RTR Global CTS immediately.

Text from TLP NOTE 4 follows:

If a forced switch of the CU is required, special precautions are required to insure the appropriate initialization level of the Out-Of-Service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down. Seek technical assistance (3B customer technical support) for diagnostic failure analysis and appropriate procedures for the force and boot of an Out-Of-Service CU.

SEE PROPRIETARY NOTICE ON COVER PAGE

See Practices 254-301-100, 254-302-100, or 254-303-106.

3. VARIABLE FIELD DEFINITIONS

a	Unit and side that failed diagnostic (for example, CU 0).
b	Failing diagnostic phase number.
c	Failing TLP keys - word 1. One bit set for each failing TLP key, 0-31.
d	Failing TLP keys - word 2. One bit set for each failing TLP key, 32-63.
e	First failing TLP key number.
f	Unique decimal number identifying the TLP process.
g	Model Version (MV) of the unit being diagnosed.
h	Equipment code.
i	Equipment location.
j	Functional schematic number for the equipment.
k	Functional schematic symbol number for the equipment.
l	Schematic diagram number for the unit.
m	Units containing the equipment when not the same as the unit being diagnosed. DO NOT REMOVE POWER OR EQUIPMENT FROM AN ACTIVE OR IN-SERVICE UNIT. ONL in the unit column means on-line or active unit. PU in the unit column means peripheral unit such as Disk File Controller (DFC) or Input/ Output Processor (IOP).
n	Weight on a scale from 1 to 10 with the equipment most likely to be faulty having the highest number.
o	Note number. If note is nonzero, see the following list. Note 0 is not used.

NOTE NUMBER — DEFINITION

CC	NOTE 01 — Do not remove power or equipment from an active or in-service unit.
CC	NOTE 02 — Cable to the maintenance channel of the CU.
CC	NOTE 03 — CU could be held stopped by Micro Level Test Set (MLTS) or Bus Display Unit (BDU).
CC	NOTE 04 — If a “forced switch” of the CU is required, special precautions are required to ensure the appropriate initialization level of the Out-Of-Service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down.

SEE PROPRIETARY NOTICE ON COVER PAGE

- Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an OOS CU.
- CC NOTE 05 — MLTS, TN16, or UN16 if equipped.
- CC NOTE 06 — CU could be powered down.
- CC NOTE 07 — Power switch board or one of the power converters may be bad. If ALARM is lighted on power switch board, power cycle CU. If light remains on in one of the power converters, that converter may be bad. If lights go out on all converters and CU fails to power up, power switch board may be bad. (Model 1 3B20 CU power switch circuitry includes EAI board, TN11.)
- CC NOTE 10 — Board is in Input/Output Processor (IOP) 0.
- CC NOTE 11 — Board is in IOP 1.
- CC NOTE 50 — Channel board in the channel 0 position.
- CC NOTE 51 — Channel board in the channel 1 position.
- CC NOTE 52 — Channel board in the channel 2 position.
- CC NOTE 53 — Channel board in the channel 3 position.
- CC NOTE 54 — Channel board in the channel 4 position.
- CC NOTE 55 — Channel board in the channel 5 position.
- CC NOTE 56 — Channel board in the channel 6 position.
- CC NOTE 57 — Board in the DMA 0 position (Model 1 UN36).
- CC NOTE 58 — Board in the DMA 1 position (Model 1 UN36).
- CC NOTE 59 — A channel address lead is being held active by CU, channel, or DMA.
- CC NOTE 60 — A channel or DMA bus may be responding and/or acknowledging falsely.
- CC NOTE 61 — A channel or DMA is holding channel error (ER bit 16) active (low).
- CH NOTE 01 — Suspect any Channel (CH) or Direct Memory Access (DMA).
- CH NOTE 02 — Unterminated or defective cable on port under test.
- CH NOTE 03 — Suspect Helper Unit circuit packs. IOP and DFC circuit packs may be at fault. For the SCSI DFC, these circuit packs include the Host Adapter (HA) and the DFC.
- CH NOTE 04 — The under-test CH is connected, via the DSCH cable, to another circuit pack. Suspect the DDSBS logic in that circuit pack or the DSCH cable.
- CSU NOTE 01 — Verify hardware for the kernel stack in interrupt stack cache memory feature corresponds with the Cache Store Unit (CSU's) Unit Control Block (UCB) Hardware Version (HV) field. A 1 in bit 0 of this field indicates the feature is present. The hardware for this feature is a UN45C Store Address Translation (SAT), with pins 149 and 047

SEE PROPRIETARY NOTICE ON COVER PAGE

- wired together on the SAT backplane to enable the feature. Discrepancy between HV value and hardware should be corrected.
- CSU NOTE 04 — If a “forced switch” of the CU is required, special precautions are required to ensure the appropriate initialization level of the Out-Of-Service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down.
- Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an OOS CU.
- DCI NOTE 01 — The Dual Serial Channel/Computer Interconnect (DCI) could be powered down. This board is located in the attached processor.
- DCI NOTE 02 — The attached processor or its software may be the cause of this phase failing.
- DFC NOTE 01 — The disk file controller (or) Disk File Controller (DFC) frame could be powered down.
- DFC NOTE 02 — Do not remove power or equipment from an active or in-service unit.
- DMA NOTE 01 — Suspect any channel or DMA.
- DMA NOTE 04 — If a “forced switch” of the CU is required, special precautions are required to ensure the appropriate initialization level of the Out-Of-Service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down.
- Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an OOS CU.
- DUIC NOTE 01 — Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
- DUIC NOTE 02 — Replacement equipment must have same Microcode (MC) number.
- IOP NOTE 01 — The Input/Output Processor (IOP) could be powered down.
- IOP NOTE 02 — Do not remove power or equipment from an active or in-service unit.
- MASC NOTE 01 — Do not remove power or equipment from an active or in-service unit.
- MASC NOTE 04 — If a “forced switch” of the CU is required, special precautions are required to ensure the

SEE PROPRIETARY NOTICE ON COVER PAGE

appropriate initialization level of the Out-Of-Service (OOS) CU being forced to the active state. An RTR level 4 boot is always required if the side to be forced active has been previously powered down.

Seek technical assistance (3B Customer Technical Support) for diagnostic failure analysis and appropriate procedures for the force and boot of an OOS CU.

- MASC NOTE 09 — Array identified by DGN CU_ MASC_ PH_ MEMORY FAILURE RESULTS output message.
- MASC NOTE 10 — Other units on the store bus: CC, other MASC in CU under test (in CUs with two UN39-UN40 MASCs), DMAs, CSU (if equipped), SAT.
- MASC NOTE 12 — Any array in Main Store Controller (MASC).
- MASC NOTE 13 — Other MASC (in CUs with 2 UN39-UN40 MASCs) may have errors active in CC ER.
- MHD NOTE 01 — Part of the DFC, the DFC must be removed from service and powered down before this equipment can be replaced.
- MHD NOTE 09 — Refer to the Maintenance Instruction Manual for KS-21995,L2 and KS-22707,L2 Memory available from Century Data System, part number 76261-3xx.
- MHD NOTE 10 — These circuit cards are located in the logic card cage of the KS-22707,L2 Memory unit. Also refer to MHD NOTE 09.
- MHD NOTE 11 — The Power Amplifier, VP58 is located behind the logic card cage. Also refer to MHD NOTE 09.
- MHD NOTE 12 — Codes for all circuit cards in the KS-22707,L1 Memory are a four-character string of alpha-numeric or alpha characters. The first character in the string determines the revision level and the last three characters determine the circuit card code. Identification of the circuit card, therefore, is based on the last three characters.
- MHD NOTE 13 — Read MHD NOTE 12 then proceed.
These circuit cards are located in the logic chassis. Refer to Practice 254-302-210, 300 Megabyte Moving Head Disk Drives, General Description, 3B20D/3B21D Model 2 Processor.
- MHD NOTE 14 — Read MHD NOTE 12 then proceed.
These circuit cards are located on the deck plate of the memory unit. Refer to Maintenance Instruction Manual for KS-22702,L1 memory.

SEE PROPRIETARY NOTICE ON COVER PAGE

MHD	NOTE 16	— MHD could be spun down.
MHD	NOTE 17	— MHD could be powered down. Check power inverter for alarm or no power. Check MHD power cord, power switch, and power indicator. On KS-22875 340MB MHD, check the diagnostic mode switch behind the front panel to ensure it is not in the diagnostic mode and the diagnostic mode indicator light is extinguished.
MHD	NOTE 18	— Incorrect ID setting could be the cause of this failure.
MTC	NOTE 01	— Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
MTC	NOTE 02	— The indicated faulty equipment is in the transport.
MTTYC	NOTE 01	— Part of the IOP controller, the IOP must be removed from service and powered down before this equipment can be replaced.
SCSDC	NOTE 01	— Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
SDLC	NOTE 01	— Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
TTYC	NOTE 01	— Part of the IOP controller; the IOP must be removed from service and powered down before this equipment can be replaced.
UC	NOTE 01	— Field Test Set (FTS) may have control of the Utility Circuit (UC).

4. ACTION TO BE TAKEN

Format 1 is failing TLP key summary information. If the failing diagnostic did not have the TLP option specified, request the diagnostic again with the TLP option. The failing TLP key summary information can be used to monitor changes in failing TLP keys. No actions based on the contents of this message are required.

Format 2 provides the ID of the TLP process which is running. No actions based on the contents of this message are required.

Formats 3 and 4 are used to repair the faulty unit using the suspected faulty equipment list. The most likely equipment is at the top of the list.

If the NOTE column 0 has non-zero entries, first read the identified TLP notes for the failing unit. TLP notes may contain information regarding the cause of the trouble. Check for any specific trouble identified by the TLP notes. In some cases, the trouble can be resolved without replacing equipment.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the UNIT column *m* has non-blank entries, the suspected faulty equipment is not in the unit that failed diagnostics. Defer replacing equipment in other units until all suspected equipment in the failing unit has been tried. It may be necessary to reconfigure the system to allow the other units to be removed from service. It will be necessary to remove from service and power down the other units before replacing equipment in the other units.

Replace the equipment at the top of the list with a spare, and retest the unit with the diagnostics. If the unit still fails, restore the original equipment to the unit and replace the next equipment on the list with a spare. Continue until faulty equipment found or list exhausted.

When faulty equipment is found, verify it causes the diagnostic failure by restoring it to the unit and rerunning diagnostics. If the diagnostics DO NOT fail as before, suspect the faulty equipment is intermittent or temperature sensitive. Occasionally, removing and restoring power to the unit or reseating equipment clears the trouble. Note the equipment involved in clearing the trouble. If the diagnostic failure returns and the same equipment is involved in clearing the trouble, replace the equipment.

If asterisks (*) are printed in the equipment location field *i*, TLP cannot directly determine the location of the equipment from the failing diagnostic *a*. If the UNIT column *m* is blank, all equipment of the code identified in *h* are implicated in the failing unit. If the UNIT column *m* identifies another unit (or units), all equipment of the code identified in *h* are implicated in the unit (or units) identified by *m*. In some cases, further resolution is possible;

If *h* = UN09, TLP may not be able to directly determine the channel based on the unit under test. Channel diagnostics should be run to more accurately determine the faulty equipment. For example, if the DMA 0 diagnostic failed and TLP implicated the UN09, run DMA 0 channel diagnostics (CH 11-14).

If *h* = UN19, this indicates that TLP cannot directly determine the channel based on the unit under test. Channel diagnostics (CH 0-9) should be run to more accurately determine the faulty equipment.

If *h* = TN69 or TN70, the TN69 or TN70 equipment in the peripheral device being used as a helper unit is being implicated. See the diagnostic listing for further information on the peripheral device involved with the phase which failed. The following translates some of the channel diagnostic phases to the subchannel being tested.

SEE PROPRIETARY NOTICE ON COVER PAGE

Failing CH Phase	Subchannel Under Test
8 or 24	0
9 or 25	1
10 or 26	2
11 or 27	3
12 or 28	4
13 or 29	5
14 or 30	6
15 or 31	7
16 or 32	8
17 or 33	9
18 or 34	10
19 or 35	11
20 or 36	12
21 or 37	13
22 or 38	14
23 or 39	15

If h = TN14, TN28 or TN56, or TN2012, this indicates TLP may not be able to determine the failing Main Store Array (MASA) based on the unit under test. Some MASC diagnostic phases have a histogram output message that identifies the failing MASA. If the MASC diagnostic was not run, the MASC diagnostic should be run to more accurately determine the faulty equipment.

TLPFILE COMPLETED
```

2. REASON FOR OUTPUT

To print trouble location information after a diagnostic has been run.

This message is printed after a failure has occurred during the execution of certain RPC diagnostic phases.

Note: The Trouble Locating Process is not implemented in this release. Although this message may be printed it adds nothing to fault resolution.

3. VARIABLE FIELD DEFINITIONS

- a A Ring Node (RN) group number (00-63).
- b Failing diagnostic phase number.
- c An 8-byte hexadecimal field which represents the failing keys - word 1.
One bit set for each of the failing TLP keys, 0-31.
- d An 8-byte hexadecimal field which represents the failing keys - word 2.
One bit set for each of the failing TLP keys, 32-63.
- e First failing key number (0-63).

4. ACTION TO BE TAKEN

In the current state of implementation, this message adds nothing to fault resolution. Refer to output message DGN:RPCN.

ID APPLY:OMDB
WORK CENTER.. MOC
GENERIC 4AP13 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] APPLY OMDB COMPLETED
- [2] APPLY OMDB COMPLETED
NO OMDB LOG FILE FOUND
- [3] APPLY OMDB NO DATABASE ENTRY FOUND FOR THE
FOLLOWING KEYS:
a
- [4] APPLY OMDB FAILED
UNABLE TO ACCESS /cft/spl/omdb
- [5] APPLY OMDB LOGFILE ERROR
ENTRY SKIPPED
b
- [6] APPLY OMDB CANNOT OPEN OR CREATE LOGFILE
UPDATE NOT LOGGED
- [7] APPLY OMDB ABORTED
UNABLE TO CREATE TEMP FILE
- [8] APPLY OMDB ABORTED
UNABLE TO SEND REQUEST TO CSOP
- [9] APPLY OMDB ABORTED
CANNOT ALLOCATE DISK SPACE FOR OMDB
- [10] APPLY OMDB ABORTED
CANNOT CREATE TEMPORARY OMDB
- [11] APPLY OMDB ABORTED
OMDB COPY FAILURE
- [12] APPLY OMDB ABORTED
CANNOT SWITCH COPIES OF OMDB

2. REASON FOR OUTPUT

To report the result of executing an APPLY:OMDB input message. Format 1 indicates successful execution of the command. Formats 2, 3, 5, and 6 are warning messages. In some cases, updates may have taken place. All other formats indicate complete failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a List of message keys for which the APPLY:OMDB failed, that is, these keys no longer exist in the OMDB disk file.
- b Logfile entry containing the syntax error.

4. ACTION TO BE TAKEN

Format 1 indicates success; no action is required. However, the list of successful updates can be found in the file /cft/cpl/OMDB_LOG.

Format 2 indicates that no record of previous updates could be found. If no updates have been made to the OMDB previously, this message can be ignored. If previous updates have been made to the OMDB, seek technical assistance.

Format 3 indicates that some of the updates failed. This generally indicates that keys have been removed from the OMDB. Verify that the keys listed no longer exist using the OP:OMDB input message to examine the DISK copy of the OMDB. If the keys do not exist, the message can be ignored. If the keys do exist, seek technical assistance.

Format 4 indicates that the OMDB disk file could not be accessed. Seek technical assistance.

Format 5 most likely results from direct manipulation of the logfile. The entry in error should be examined for the cause of the error, and if appropriate, the UPD:OMDB input message can be used to reapply that update with the corrected data. The format of each logfile entry is: a keyword indicating the type of update (either ALARM or MSGCLS), the new value for either the alarm level or the message class, and a list of keys for which the update had been performed.

Formats 6 and 7 indicate a possible file system problem. Use the OP:ST-FREEDISK input message to check if the root file system is out of place. If the file system is out of place, clean up unused files and retry the command. If the file system is not out of space, seek technical assistance.

Format 8 indicates that the command could not send a message to the Coordinator Of Spooler Output Processes (CSOP). Seek technical assistance.

Formats 9 through 12 indicate that CSOP could not make a new temporary copy of the OMDB for applying updates while the OMDB is in the temporary state. Seek technical assistance.

5. REFERENCES

OMDB Keys

- Format 1 has an OMDB key of 5.
- Format 2 has an OMDB key of 2.
- Format 3 has an OMDB key of 3.
- Format 5 has an OMDB key of 8.

- e FAR END LINE LOOPBACK
FAR END PAYLOAD LOOPBACK
NEAR END PAYLOAD LOOPBACK
NO LOOPBACK
- f Duration in minutes the test is to be run (1-720).
- g FEULN
NEULN
NEULN AND FEULN
- h Approximately twenty four hour network time the report will be generated.
- i Origination address for ULN (A or Z)
- j Destination address for ULN (A or Z)
- k Side equipment or facility (E or F). ULN is E only.
- l Current network time of day or current network time of day report completed.
- m Valid intervals in the report data.
- n 8-bit current status of the T1 device. The current-status octet for the ULN T1 termination has the following per-bit indicators to show the status/health of the receive-side signal of the designated T1 termination:

7 6 5 4 3 2 1 0 <-bit position

cur_stat=U F R Y A T L O where:

The previous bit positions match the following descriptions of valid status indications:

Octet		
Bit	Bit	
Pos.	Symbol	Description
b7	U	Set when any remaining bit is set
b6	F	Set when unavailable-signal (alias failed signal) condition exists
b5	R	Red alarm (i.e., red LOF or CFC)
b4	Y	YELLOW alarm signal detected on ESF-DL
b3	A	BLUE alarm indication signal (LOF/CFC)
b2	T	Not used

SEE PROPRIETARY NOTICE ON COVER PAGE

Octet		
Bit	Bit	
Pos.	Symbol	Description (continued)
b1	L	Test signal or loopback activated on transmit side
b0	O	LOS/LFVR alarm state

For invalid status indications. U-bit not set, and the following values are recorded on the remaining bits:

b7 U Bit NOT set; bit=0;
b3 A Request denial between ULNs (new for ULN)

o Time interval/interval time, one of 96 15-minute intervals in a 24-hour period.

p Duration of the interval.

q Count of the specific error:

- Errored Seconds (ES) - a second with one or more:
 - CRC6 checksum errors
 - Out-Of-Frame (OOF) conditions
 - Slip events
- Failed Seconds (FS) - also called an Unavailable Seconds (UAS). A second during which:
 - One Loss-Of-Frame (LOF) occurs
 - The failed signal state is entered, following 10 consecutive Severely-Errored Seconds (SES)
- Bursty-Errored Seconds (BES) - a second with:
 - One < CRC6 errors <320
- Severely Errored Seconds (SES) - a second with:
 - 320 or more CRC6 errors
 - One or more OOF conditions
 - One or more slip events
- Controlled- SLIP Seconds (SLIPS) - also called a slip event. A second with:
 - The occurrence of slip buffer overflow or underflow
- Loss Of Frame Count (LOFC) - the number of times:
 - A RED (alarm) LOF event
 - A BLUE (alarm) LOF event occurs

4. ACTION TO BE TAKEN

Formats 1 through 8, 10, 20 and 21 - None.

Format 9, where reason is

MINOR STATE ISN'T MOOS, or
MINOR STATE ISN'T TEST, or
MAJOR STATE ISN'T AVL/UNA, or
INVALID LINK TYPE FOR T1 TESTING,

the node must be a Universal Link Node (ULN) or High Speed Link and the link must be in the AVL, MOOS or UNA, TEST state. Put the link in one of the previously-mentioned states.

For all other values, if the action to be taken is not self explanatory, seek technical assistance.

Format 11, None or stop the in progress Automatic Trouble Report ATR and start a new ATR.

Format 12, None, the node must be a ULN or HSL, and in the AVL/MOOS or UNA/TEST state. Put the HSL in one of the previously-mentioned states. For all other values of r, if the action to be taken is not self-explanatory, seek technical assistance.

Format 13, restart the test session if desired.

Format 14, if NEAR END,

1. Verify that the ULN node is restored, and that the ULN link state is AVL, MOOS or UNA, TEST.
2. Try the command again. If this second try also fails, then
3. Remove and restore the node, verify the ULN's link is in the proper link state, and try the command again. If this third try also fails, then
4. Enter the OP:T1M,ST,...;NEULN:RAW input command to collect information about the status of the ULN, and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 14, if FAR END,

- A. Determine whether the T1 facility has failed.
Enter the `OP:T1M,ST,LNgg mm;FEULN:RAW` command to get the status of the ULN and the T1 facility. Examine the `OP:T1M,ST` output and verify:
1. That the T1 facility has not failed. If the `RSP_STAT UFRYATLO` field is not all zeroes, then use the `OP:T1M` output message to interpret the non-zero indications to determine whether a T1 facility failure has occurred.
- If a T1 facility failure has occurred, and if the tester has direct access to the far-end ULN via its far-end STP (i.e. NOT via the failed T1 path), then the tester should be able to start/stop the test signal with the `EXC:T1M, . . . ;FEULN;{START|STOP}` form of the command on the far-end ULN.
- B. If the T1 facility has NOT failed, and the previous test attempts fail, then:
1. Remove/restore the near-end ULN, ensure the ULN is restored and its link is in the AVL, MOOS or UNA, TEST link state, and retry the intended test procedure.
 2. Remove/restore the far-end ULN, ensure that the ULN is restored and its link is in the AVL, MOOS or UNA, TEST link state, and retry the intended test procedure. If it still fails, then seek technical assistance.

Format 15, try the command again. If the problem persists, seek technical assistance.

Format 16, terminate any existing intrusive activity via `EXC:T1M`; then retry the `ATR:T1M` request again.

Determine whether the denial might be due to the near-end T1 intrusive test status and the far-end T1 intrusive test status being out of agreement because of a previous/current T1 path failure.

Enter the `OP:T1M,ST, . . . ;NEULN:RAW` input command for the near-end, and `OP:T1M,ST, . . . ;FEULN:RAW` for the far-end ULNs, and examine the output to see whether the intrusive test statuses are consistent. If the near-end and the far-end statuses agree, use the `EXC:T1M, . . . ;STOP` command to bring them into agreement, then restart/resume testing.

Format 17, try the command again. If the problem persists, seek technical assistance.

Format 18, None, or Stop a test so the desired test can be started.

Format 19, where reason is
`CBNMTCE GRD TMR T.O. AWAIT T1DH RESP`, or
`FE CBNMTCE GRD TMR T.O. AWAIT T1DH RESP`,
try the command again, making sure the node is fully restored. If the problem persists, seek technical assistance. If, however:

Format 19, where reason is `CBNMTCE MTCE MODE NOT ENAB FOR ITR TST`, ensure that the link state is either AVL, MOOS or UNA, TEST, then try the command again. If the problem persists, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 22, before starting another ATR command on the RNA, use the EXC command to stop the test signal and/or loopback that was left active when the ATR completed, but was unable to deactivate the test signal and/or loopback that was activated by the ATR.

Format 23, try the command again. If the problem persists, seek technical assistance.

Format 24, see Format 22 actions to be taken, then see Format 23 actions to be taken.

Format 25, see Format 23 actions to be taken.

Format 26, remove and restore the RNA if possible, and try the command again. Otherwise seek technical assistance.

Format 27, see Format 23 actions to be taken.

Format 28, Before starting another ATR command on the RNA, use the EXC command to stop the test signal and/or loopback that was left active when the ATR failed. Then see Format 23 actions to be taken.

Formats 29 and 30, see Format 26 actions to be taken.

Format 31, where reason is CBNMTCE GRD TMR T.O. AWAIT T1DH RESP, try the command again, making sure the node is fully restored. If the problem persist, seek technical assistance. If, however:

Format 31, where reason is CBNMTCE MTCE MODE NOT ENAB FOR ITR TST, ensure that the link is either AVL, MOOS or UNA, TEST, then try the command again. If the problem persists, seek technical assistance. For all other values of r, if the action to be taken is not self-explanatory, seek technical assistance.

Format 32, where reason is FE CBNMTCE GRD TMR T.O. AWAIT T1DH RESP try the command again, making sure the node is fully restored. If the problem persist, seek technical assistance. If, However:

Format 32, where reason is CBNMTCE MTCE MODE NOT ENAB FOR ITR TST, ensure that the link is either AVL, MOOS or UNA, TEST, then try the command again. If the problem persists, seek technical assistance. For all other values of r, if the action to be taken is not self-explanatory, seek technical assistance.

Format 33, if desired to get a far end performance data report for the ATR on this RNA, stop the far end line loopback via the EXC command, then try the ATR command again.

Format 34, see Format 9 actions to be taken.

Format 35, if desired, deactivate the near-end line loopback with the EXC command, then try the ATR command again.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|---|
| a | Instance name (HOURLY, DAILY, MANUAL, or SOFTREQ). |
| b | Total number of errors found. |
| c | Total number of errors corrected. |
| d | Aborted code. Possible values are:

3 — Audit aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — SIM could not start or dispatch the audit.
6 — Error encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limits.
8 — SIM aborted an executing routine audit because of a blocking request. |

SEE PROPRIETARY NOTICE ON COVER PAGE

e

Error Code:

0 — Error found in a partition header.

f — The audit instance name.

0 — HOURLY

1 — DAILY

2 — SOFTREQ

3 — MANUAL

g — Partition header number.

h — Partition header status.

0 — The partition is under initialization.

1 — The partition has recording register available.

2 — The partition has no recording register available.

3 — The partition is under audit.

i — This field is not used, therefore, it is always 0.

1 — Error found in a recording register.

f — Recording register index number.

g — The partition header number to which the recording register belongs.

h — The recording register type, Automatic Message Accounting (AMA) / International Call Detail Recording (ICDR).

i — The (AMA/ICDR) table entry number contained in the recording register.

2 — Error found in (AMA/ICDR) index table.

f — The index number of the recording register which points to a table entry that does not point to it.

g — The recording register index number in the table entry.

h — Table type.

1 — AMA table.

2 — ICDR table.

i — The (AMA/ICDR) table entry number contained in the recording register.

j — Explanation of error - see Output Audit Appendix A, APP:AUD-A.

k — Explanation of error - see Output Audit Appendix B, APP:AUD-B.

l — Explanation of error - see Output Audit Appendix C, APP:AUD-C.

m — Explanation of error - see Output Audit Appendix D, APP:AUD-D.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

STOP: AUD does not apply to this audit, since this audit is defined as nonkillable.

Refer to the *System Audit User's Guide* for recovery procedures from serious to fatal failures.

2. REASON FOR OUTPUT

To report the termination status of the Attached Processor Driver (APDRV) 1 audit, and/or any APDRV buffer allocation errors that were found during the execution of the APDRV audit.

3. VARIABLE FIELD DEFINITIONS

a Instance name:

DMABUF — Direct memory access buffer.

FMIBUF — File manager interface buffer.

b Error code:

1 — Addressing error.

2 — Buffer missing from linked list; lost buffer inserted.

3 — Buffer missing from linked list; lost buffer not inserted.

4 — Excessive buffers duplicated on linked lists; APDRV recovery to reinitialize buffers and notify 1B by removing the Attached Processor Interface (API) units.

5 — Excessive buffers duplicated on linked lists; linked list not reconstructed.

6 — Buffer with invalid job status; recovery taken.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 7 — Buffer with invalid job status; recovery not taken.
 - 8 — Links found bad on list; links corrected.
 - 9 — Links found bad on list; links not corrected.
- c Address of the buffer with error.
- d Invalid buffer data (job status or link number).
- e Index of buffer with error.
- f Expected data.
- g Total number of errors found.
- h Total number of errors corrected.
- i Abort code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.

4. ACTION TO BE TAKEN

No action is necessary.

DATA3 X'e DATA4 X'f

AUD ENV=RTR APDRV 3 ABORTED CODE i

2. REASON FOR OUTPUT

To report the termination status of audit Attached Processor Driver (APDRV) 3 and /or any 1B status file errors that were found during the execution of the APDRV audit. The audit will also report errors found in the file administration table of the APDRV. The file administration table contains information that the system uses to determine from which file should come normal reads/writes and read specifics. One raw data block will be printed for each error found in the file administration table. Only one raw data block will be printed if errors are found in the 1B status file.

3. VARIABLE FIELD DEFINITIONS

- a Instance name:
STATFLAGS — File status flags.
- b Error code:
1 — Inconsistency in 1B status file (corrected).
2 — Inconsistency in 1B status file (non-corrected).
3 — Logical device ID found to be bad in file administration table (corrected).
4 — Logical device ID found to be bad in file administration table (non-corrected).

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — Key number found to be bad in file administration table (corrected).
- 6 — Key number found to be bad in file administration table (non-corrected).
- c Address of file administration table slot for capability number found to be bad.
- d Bad data found to be inconsistent with 1B status file.
- e Index (capability number) of inconsistent data:
 - 1 — Entry for reads/ writes to NORMAL file found to be bad.
 - 2 — Entry for reads/ writes to UPDATE file found to be bad.
 - 3 — Entry for specific requests to disk 0 found to be bad.
 - 4 — Entry for specific requests to disk 1 found to be bad.
 - 5 — Entry for request to file 0, disk 0, found to be bad.
 - 6 — Entry for requests to file 0, disk 1, found to be bad.
 - 7 — Entry for request to file 1, disk 0, found to be bad.
 - 8 — Entry for requests to file 1, disk 1, found to be bad.
- f Expected data for this file administration capability number.
- g Total number of errors found.
- h Total number of errors corrected.
- i Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.

4. ACTION TO BE TAKEN

If an inconsistency was found in the 1B status file (error code is 1 or 2), the disk copy of the 1B status file will be checked for internal consistency. If the disk copy is also found to be bad, the information in the status file will be defaulted to a known value and 1B will duplex fail 1B file access (indicated by a Base Level Maintenance Report at the 1B informing the uses of this).

If this duplex failure condition occurs, follow normal procedures for recovering from 1B file access duplex failure. If the audit does not result in 1B file access duplex failure, then no action is necessary.

2. REASON FOR OUTPUT

To report the termination status of audit Attached Processor Driver (APDRV) 4 and / or any APDRV disk cache audit errors that were found during the execution of the APDRV audit.

3. VARIABLE FIELD DEFINITIONS

- a Instance name:
- CACHECCB — Disk cache control block audit.
CACHEBAL — Disk cache blocked address list audit.
- b Error code.
- For disk Cache Control Block (CCB) audit:
- 1 — CCB header cache_size incorrect, corrected from 1B status file (/dev/1astat).
 - 2 — CCB header cache_size incorrect, not corrected.
 - 3 — CCB header max_req_size incorrect, corrected from 1B status file.
 - 4 — CCB header max_req_size incorrect, not corrected.
 - 5 — CCB header max_cache_num incorrect, corrected from 1B status file.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6 — CCB header max_cache_num incorrect, not corrected.
- 7 — CCB header cache_sz_bytes incorrect, corrected from 1B status file.
- 8 — CCB header cache_sz_bytes incorrect, not corrected.
- 9 — CCB header cache_probe incorrect, initialized to one.
- 10 — CCB header cache_probe incorrect, not corrected.
- 11 — FREE CCB data incorrect, data fields initialized. (See item d for fields found incorrect).
- 12 — FREE CCB data incorrect, data fields not corrected. (See item d for mask of fields found incorrect).
- 13 — AVAILABLE CCB data incorrect, data fields initialized. (See item d for fields found incorrect).
- 14 — AVAILABLE CCB data incorrect, data fields not corrected. (See item d for fields found incorrect).
- 15 — BUSY CCB data incorrect, data fields initialized. (See item d for fields found incorrect).
- 16 — BUSY CCB data incorrect, data fields not corrected. (See item d for fields found incorrect).
- 17 — CCB found in invalid state, CCB initialized.
- 18 — CCB found in invalid state, CCB not corrected.

For disk cache Blocked Address List (BAL) audit:

- 1 — BAL link bad on free linked list, link corrected.
- 2 — BAL link bad on free linked list, link not corrected.
- 3 — Free BAL data incorrect, data corrected. (See item d for fields found incorrect).
- 4 — Free BAL data incorrect, data not corrected. (See item d for fields found incorrect).
- 5 — BAL link bad on active linked list, link corrected.
- 6 — BAL link bad on active linked list, link not corrected.
- 7 — Active BAL data incorrect, data corrected. (See item d for fields found incorrect).
- 8 — Active BAL data incorrect, data not corrected. (See item d for fields found incorrect).
- 9 — BAL lost from linked lists, lost buffer inserted.
- 10 — BAL lost from linked lists, lost buffer not inserted.
- 11 — Duplicate BALs found on linked lists, APDRV recovery initiated to reinitialize buffers and notify 1B by removing APIs.
- 12 — Duplicate BALs found on linked lists, linked lists not reconstructed.

c Address of the buffer with error.

d Invalid buffer data or mask of fields found incorrect or zero.

For a = CACHECCB and b = 1-10, 17, 18 or
a = CACHEBAL and b = 1, 2, 5, 6:

b = Invalid buffer data.

SEE PROPRIETARY NOTICE ON COVER PAGE

For a = CACHECCB and b = 11-16 or
a = CACHEBAL and b = 3, 4, 7, 8:

b = Mask of fields found incorrect:

- Bit 0 — CCB WIPMAP (DMA write in progress map) field incorrect.
- Bit 1 — CCB RIP (read from disk in progress) field incorrect.
- Bit 2 — CCB DJIP (DMA read jobs in progress) field incorrect.
- Bit 3 — CCB/BAL disk address incorrect.
- Bit 4 — CCB/BAL FQR (first File Manager Interface (FMI) queued request) field incorrect.
- Bit 5 — CCB/BAL LQR (last FMI queued request) field incorrect.
- Bit 6 — CCB/BAL previous FMI buffer link found incorrect.
- Bit 7 — CCB/BAL next FMI buffer link found incorrect.
- Bit 8 — CCB/BAL NWO (number of CCBs waiting on) found incorrect.
- Bit 9 — Queued FMI buffer cache_flag incorrect.
- Bit 10 — Queued FMI buffer bale_flag incorrect.

e Index of buffer with error.

f Expected data or zero.

For a = CACHECCB and b = 1-10 or
a = CACHEBAL and b = 1, 2, 5, 6:

f = Expected data.

g Total number of errors found.

h Total number of errors corrected.

i Abort code:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — System Integrity Monitor (SIM) could not start or dispatch audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.

- 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.

g

Error code for Audits 1-8.

Error codes for Audit 1:

- 1 — Call Block state is not idle.
Data word 1: Idle Call Block sublist number.
Data word 2: Current Call Block index.
- 2 — First Call Block does not point back to CB_NULL.
Data word 1: Idle Call Block sublist number.
Data word 2: Current Call Block index.
Data word 3: Previous Call Block index.
- 3 — Next Call Block in sublist is not idle.
Data word 1: Idle Call Block sublist number.
Data word 2: Next Call Block index.
Data word 3: Current Call Block index.
- 4 — Next Call Block in sublist does not point back to current Call Block.
Data word 1: Idle Call Block sublist number.
Data word 2: Next Call Block index.
Data word 3: Next Call Block's backward index.
Data word 4: Current Call Block index.
- 5 — Multiple sublists connected.
Data word 1: Idle Call Block sublist number.
Data word 2: Alien Call Block sublist number.
Data word 3: Alien Call Block index.
Data word 4: Previous Call Block index.
- 6 — Idle Call Block sublist's head pointers have inconsistent values.
Data word 1: Idle Call Block sublist number.
Data word 2: Forward head pointer.
Data word 3: Backward head pointer.
- 7 — First Call Block on sublist belongs to another sublist.
Data word 1: Idle Call Block sublist number.
Data word 2: Alien Call Block sublist number.
Data word 3: Alien Call Block index.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 8 — Dangling idle Call Blocks.
Data word 1: Idle Call Block sublist number.
Data word 2: Idle Call Block count from sublist.
Data word 3: Idle Call Block count from Call Block array.
- 9 — Next Call Block index is out of range.
Data word 1: Idle Call Block sublist number.
Data word 2: Current Call Block index.
Data word 3: Next Call Block index.
- 10 — Sublist's backward head pointer does not point to last Call Block in sublist.
Data word 1: Idle Call Block sublist number.
Data word 2: Last Call Block index.
Data word 3: Backward head pointer.
- 11 — Index of first Call Block in sublist is out or range.
Data word 1: Idle Call Block sublist number.
Data word 2: First Call Block index.

Error Codes for Audit 2:

- 1 — TSN state in the TSN Table is not P1.
Data word 1: Call Block index.
Data word 2: Call Block's P1 TSN.
Data word 3: TSN state in the TSN Table.
- 2 — TSN state in the TSN Table is not P2.
Data word 1: Call Block index.
Data word 2: Call Block's P2 TSN.
Data word 3: TSN state in the TSN Table.
- 3 — Call Block index in TSN Table for P1 TSN is not the current Call Block index.
Data word 1: Current Call Block index.
Data word 2: Call Block's P1 TSN.
Data word 3: Call Block index in the TSN Table.
- 4 — Call Block index in TSN Table for P2 TSN is not the current Call Block index.
Data word 1: Current Call Block index.
Data word 2: Call Block's P2 TSN.
Data word 3: Call Block index in the TSN Table.
- 5 — Timer A is not in the Timer ID List.
Data word 1: Call Block index.
Data word 2: Timer ID.
- 6 — Timer B is not in the Timer ID List.
Data word 1: Call Block index.
Data word 2: Timer ID.
- 7 — Internal timer is not in the Timer ID List.
Data word 1: Call Block index.
Data word 2: Timer ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 8 — Timer A is not active.
Data word 1: Call Block index.
Data word 2: Timer ID.
Data word 3: Timer's current list.
- 9 — Timer B is not active.
Data word 1: Call Block index.
Data word 2: Timer ID.
Data word 3: Timer's current list.
- 10 — Internal timer is not active.
Data word 1: Call Block index.
Data word 2: Timer ID.
Data word 3: Timer's current list.
- 11 — Call Block's and Timer Block's Timer IDs do not agree (UserA).
Data word 1: Call Block index.
Data word 2: Call Block's Timer ID.
Data word 3: Timer Block's Timer ID.
- 12 — Call Block's and Timer Block's Timer IDs do not agree (User B).
Data word 1: Call Block index.
Data word 2: Call Block's Timer ID.
Data word 3: Timer Block's Timer ID.
- 13 — Call Block's and Timer Block's Timer IDs do not agree (Internal).
Data word 1: Call Block index.
Data word 2: Call Block's Timer ID.
Data word 3: Timer Block's Timer ID.
- 14 — Call Block's P1 TSN is zero.
Data word 1: Call Block index.
- 15 — Timer Block address out of range (User A).
Data word 1: Call Block index.
Data word 2: Call Block's Timer ID.
Data word 3: Timer Block address.
- 16 — Timer Block address out of range (User B).
Data word 1: Call Block index.

Data word 2: IMS time limit.
Data word 3: Absolute time difference.
- 19 — Application time limit exceeded for the Audits pool.
Data word 1: Ring Write Buffer index.
Data word 2: Application time limit.
Data word 3: Absolute time difference.
- 20 — IMS time limit exceeded for the Audits pool.
Data word 1: Ring Write Buffer index.
Data word 2: IMS time limit.
Data word 3: Absolute time difference.
- 21 — Application time limit exceeded for the Generic Utilities pool.
Data word 1: Ring Write Buffer index.
Data word 2: Application time limit.
Data word 3: Absolute time difference.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 22 — IMS time limit exceeded for the Generic Utilities pool.
Data word 1: Ring Write Buffer index.
Data word 2: IMS time limit.
Data word 3: Absolute time difference.
- 23 — Application time limit exceeded for the Error Reporting pool.
Data word 1: Ring Write Buffer index.
Data word 2: Application time limit.
Data word 3: Absolute time difference.
- 24 — IMS time limit exceeded for the Error Reporting pool.
Data word 1: Ring Write Buffer index.
Data word 2: IMS time limit.
Data word 3: Absolute time difference.

Error code for Audit 7:

- 1 — Call Block data mismatch.
Data word 1: Call Block's P1 TSN.
Data word 2: Call Block's word number.
Data word 3: Remote Call Block word's contents.
Data word 4: Local Call Block word's contents.

Error codes for Audit 8:

- 1 — Invalid Primary Database.
Data word 1: Primary Database pointer.
Data word 2: Pointer to Database A.
Data word 3: Pointer to Database B.
- 2 — Primary Hash Table is not Hash Table A.
Data word 1: Incorrect Primary Hash Table pointer.
Data word 2: Hash Table A pointer.
- 3 — Primary Hash Table is not Hash Table B.
Data word 1: Incorrect Primary Hash Table pointer.
Data word 2: Hash Table B pointer.
- 4 — Primary Access Table is not Access Table A.
Data word 1: Incorrect Primary Access Table pointer.
Data word 2: Access Table A pointer.
- 5 — Primary Access Table is not Access Table B.
Data word 1: Incorrect Primary Access Table pointer.
Data word 2: Access Table B pointer.
- 6 — Secondary Database is not Database A.
Data word 1: Incorrect Secondary Database pointer.
Data word 2: Database A pointer.
- 7 — Secondary Database is not Database B.
Data word 1: Incorrect Secondary Database pointer.
Data word 2: Database B pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 8 — Secondary Hash Table is not Hash Table A.
Data word 1: Incorrect Secondary Hash Table pointer.
Data word 2: Hash Table A pointer.
- 9 — Secondary Hash Table is not Hash Table B.
Data word 1: Incorrect Secondary Hash Table pointer.
Data word 2: Hash Table B pointer.
- 10 — Secondary Access Table is not Access Table A.
Data word 1: Incorrect Secondary Access Table pointer.
Data word 2: Access Table A pointer.
- 11 — Secondary Access Table is not Access Table B.
Data word 1: Incorrect Secondary Access Table pointer.
Data word 2: Access Table B pointer.
- 12 — Incorrect Feature Table pointer.
Data word 1: Incorrect Feature Table pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID AUD:CNC-1
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,IMS
TYPE Output

1. FORMAT

- [1] AUD ENV=RTR CNC 1 COMPLETED
 - a ERRORS FOUND
 - b ERRORS CORRECTED
- [2] AUD ENV=RTR CNC 1 STOPPED
- [3] AUD ENV=RTR CNC 1 ABORTED CODE c
- [4] AUD ENV=RTR CNC 1 ERROR d REPORT
 - DATA1 X'e DATA2 X'f
 - DATA3 X'g DATA4 X'h

NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To report the termination status of the Central Node Control (CNC) audit and/or any errors found.

This audit may have been executed due to:

1. Routine schedule.
2. Manual request.
3. IMS initialization (level 0 or 1B).

When the audit finds no errors, termination status is printed only for manual requests.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected. Non-zero values indicate that error correction will be attempted, not that it has been verified.
- c Abort Code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run.
- 13 — SIM aborted executing audit because audit subsystem is being reinitialized.

d

Error code:

- 0 — Illegal restore job state (e or g).
- 1 — Restore job states (e and g) inconsistent about CNC abort.
- 2 — Restore job states (e and g) indicate too many active jobs.
- 3 — Restore job states (e and g) indicate queued job with none active.
- 4 — Job or CNC abort time limit exceeded.
- 5 — CNC and ARR inconsistent.
- 6 — CNC has job from dead IMSRMVRST.
- 7 — CNC inconsistent with RST.IUN.
- 8 — 3BWRT.NP inconsistent with IUN.PUMP.

e

For d = 0-5, CNC's ARR restore job state:

- 0 — Idle.
- 1 — Queued.
- 2 — Active.
- 3 — CNC aborting jobs.
- 4 — CNC aborting jobs and job queued.

For d = 6, CNC's MIRA restore job state, values same as for CNC's ARR restore job state.

For d = 7, indicates source of CNC's active restore job:

- 0 — ARR.
- 1 — MIRA (via IMSRMVRST).
- other — No active restore job.

For d = 8, 3BWRT.NP's current work: physical node address (X'C00-X'FFF) or no work (X'1000) or otherwise busy (X'1001).

f

For d = 0-5, CNC's ARR restore job physical node address (X'C00-X'FFF), when job queued or active.

For d = 6, CNC's MIRA restore job physical node address (X'C00-X'FFF), when job queued or active.

For d = 7, if e = 0-1, CNC's active restore job's state:

- 0 — Idle.
- 1 — Queued.
- 2 — Active.
- 3 — CNC aborting jobs.
- 4 — CNC aborting jobs and job queued.

SEE PROPRIETARY NOTICE ON COVER PAGE

- For d = 8, IUN.PUMP's current work: physical node address (X'C00-X'FFF), no work (X'1000) or otherwise busy (X'1001).
- g For d = 0-4, CNC's MIRA restore job state:
- 0 — Idle.
 - 1 — Queued.
 - 2 — Active.
 - 3 — CNC aborting jobs.
 - 4 — CNC aborting jobs and job queued.
- For d = 5, NODE.RMON's view of CNC ARR work: physical node address (X'C00-X'FFF), no work (X'1000) or otherwise busy (X'1001).
- For d = 6, not used.
- For d = 7, if e = 0-1, CNC's active restore job's physical node address (X'C00-X'FFF).
- For d = 8, CNC's ARR work: physical node address (X'C00-X'FFF) or no work (X'1000).
- h For d = 0-4, CNC's MIRA restore job physical node address (X'C00-X'FFF), when job queued or active.
- For d = 5-6, not used.
- For d = 7, RST.IUN's current restore work: physical node address (X'C00-X'FFF), no work (X'1000) or otherwise busy (X'1001).
- For d = 8, CNC's MIRA work: physical node address (X'C00-X'FFF) or no work (X'1000).

4. ACTION TO BE TAKEN

Format 1 should appear alone only when the audit is manually requested with the summary option or detected no errors. Error analysis must be based on Format 4 messages.

Format 2 is printed when an execution of the audit is stopped via the STOP:AUD input message or by an initialization of the IMS subsystem.

Format 3 should occur only during outages and initializations of the IMS subsystem. If it occurs when IMS is operational, seek technical assistance.

Format 4 reports errors detected by the audit. Seek technical assistance to determine the cause of the trouble.

All of the errors reported by this audit indicate mutilated internal data or other software problems. Such errors can occur as a side effect of other problems, such as those reported via the REPT:IMSDRV-FLT output message.

SEE PROPRIETARY NOTICE ON COVER PAGE

If error correction was indicated ($b > 0$), then the audit attempted to clear the trouble by canceling the maintenance jobs associated with the errors.

To verify that error correction was successful, run the audit again via the AUD:CNC-1 input message.

2. REASON FOR OUTPUT

To report the termination status of the CUMEM audit and/or any error found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
- ERROR 30 Error code, in decimal notation. Offline store access failed.
- ERROR 34 Error code, in decimal notation. Memory mismatch mainstore error.
- ERROR 36 Error code, in decimal notation. Memory mismatch cache error.
- d Audit test number that failed. This is the physical mainstore address at which the test failed.
- e Was error corrected:
 - 1 — Yes.
 - 15 — No.
- f Field is not used and has a value equal to 0.
- g Error code, in decimal notation:
 - 2 — Bad data in the Equipment Configuration Database (ECD) for a Control Unit (CU) unit or subunit.
 - 4 — Could not access the ECD. Possibly a bad Record Identification (RID) number.
 - 6 — Maintenance channel failed.
 - 8 — Could not read the offline mainstore.
 - 10 — Call to the kconfig library failed.
 - 12 — Erroneous major state for a CU unit or subunit.
 - 14 — Bad online System Status Register (SSR) value.
 - 16 — Bad offline SSR value.
 - 18 — Bad online Hardware Status Register (HSR) value.
 - 20 — Bad offline HSR value.
 - 24 — Plant measurements library call failed.
 - 26 — Audit control library call failed.
 - 28 — Internal CUMEM error.
 - 32 — Internal error during memory compare.
 - 38 — CUMEM tried to run, CUs not in active standby.
- h Audit test number that failed:
 - 0x2000 — Memory audit did not complete its entire memory block comparison.
 - 0x2001 — Call to kconfig rptrerr unsuccessful.
 - 0x2002 — Call to kconfig rptrerr unsuccessful.
 - 0x2003 — Call to kconfig fltdrvr to remove other CU unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x2004 — CUMEM called when offline CU was not standby.
- i Complemented offline SSR value (asserted = 1).
- j Complemented on-line SSR value (asserted = 1).
- k Explanation of error - see Audit Appendix C, APP:AUD-C.
- l Explanation of error - see Audit Appendix D, APP:AUD-D.
- m Explanation of error - see Audit Appendix B, APP:AUD-B.
- n Inhibit status:
- ALLOWED — Audit has been automatically allowed by SIM.
- INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Audit Appendixes A and B, APP:AUD-A and APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. See the CIC Select Code 304-046 *System Maintenance Manual* for additional information on audits. The list contains some actions to specific error codes. If the message persists, contact your next level of technical assistance.

Error: Action:

- 4 — Run the ECD 1 audit.
- 6 — If the offline CU was not taken out of service, remove it. Diagnose it, repair it if necessary, and restore it. Then switch CUs and remove, diagnose, repair and restore the other CU.
- 8 — The offline CU should have been removed automatically. Diagnose it, repair it if necessary, and restore it. Then switch CUs and remove, diagnose, repair, and restore the other CU.
- 24 — Run the PMS 1 audit.
- 30 — The offline CU should have been removed automatically. Diagnose it, repair it if necessary, and restore it. Then switch CUs and remove, diagnose, repair, and restore the other CU.
- 34 — If the offline CU was not taken out of service, remove it. Diagnose it, repair it if necessary, and restore it.
- 36 — If the online CU was not taken out of service, switch CUs and remove it. Diagnose it, repair it if necessary, and restore it.

 - 32 — Internal error during memory compare.
 - 38 — CUMEM tried to run, CUs not in active standby.
 - 42 — EAI buffers mismatch.
 - 44 — SSR values inconsistent between CUs.
- e Audit test number that failed. This is the physical mainstore address at which the test failed.
- f Was error corrected:
- 1 — Yes.
 - 15 — No.
- g Field is not used and has a value equal to 0.

SEE PROPRIETARY NOTICE ON COVER PAGE

h

Audit test number that failed:

- 0x1000 — RID for on-line CU is IDNULL.
- 0x1001 — Call to ECD lla_rdget to get on-line CU UCB unsuccessful.
- 0x1002 — On-line CU UCB u_dtype (device type) not DEV_CU.
- 0x1003 — RID for off-line CU is same as RID for on-line CU.
- 0x1004 — Call to ECD lla_rdget to get off-line CU UCB unsuccessful.
- 0x1005 — Off-line CU UCB u_dtype (device type) not DEV_CU.
- 0x1006 — Call to ECD lla_rdget to get on-line CU Minor Device Chain Table (MDCT) unsuccessful.
- 0x1007 — MDCT for the on-line CU has too many m_minxt entries. This would indicate that there are more than two CUs.
- 0x1008 — MDCT for the on-line CU has too many m_minxt entries. This would indicate that there are more than two CUs.
- 0x1009 — MDCT m_minxt[0] equals m_minxt[1] indicating that CU0 and CU1 have same RIDs.
- 0x100a — MDCT m_minxt[0] does not equal RID for on-line or off-line CU.
- 0x100b — MDCT m_minxt[1] does not equal RID for on-line or off-line CU.
- 0x1100 — Maintenance Channel (MCH) not functional.
- 0x1101 — Off-line CU memory access failure; update circuit not functional.
- 0x1102 — Call to kconfig fltdrvr to remove other CU unsuccessful.
- 0x1103 — Call to kconfig fltdrvr to remove other CU unsuccessful.
- 0x1105 — Maintenance Channel (MCH) and update circuit not functional; but other CU UCB u_stat is Standby (STBY).
- 0x1106 — Call to kconfig fltdrvr to remove other CU unsuccessful.
- 0x1107 — Call to kconfig chgstate to change off-line CU UCB u_stat to UNAV unsuccessful.
- 0x1108 — Call to kconfig chgstate to change off-line CU UCB u_stat to UNAV unsuccessful.
- 0x1109 — Call to ECD lla_rdget to get off-line CU UCB unsuccessful.
- 0x110b — Call to ECD chuchb to change off-line CU UCBs u_manrqst to ON unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x110c — Call to kconfig chgstate to change off-line CU UCB u_stat to OOS unsuccessful.
- 0x110d — Call to ECD chucb to change off-line CU UCBs u_manrqst to OFF unsuccessful.
- 0x110e — Call to ECD lla_rdget to get off-line CU UCB unsuccessful.
- 0x1200 — On-line CU UCB u_stat not Active (ACT) or Initializing (INIT).
- 0x1201 — Call to kconfig chgstate to change on-line CU UCB u_stat to ACT unsuccessful.
- 0x1202 — Off-line CU SSR (SSR_CC bit 19) indicates it is the on-line CU.
- 0x1203 — Call to PCPAUD initofl to initialize off-line CU unsuccessful.
- 0x1204 — Call to kconfig fltdrvr to remove other CU unsuccessful.
- 0x1205 — Off-line CU UCB u_stat is ACT.
- 0x1206 — Call to kconfig fltdrvr to remove other CU unsuccessful; Other CU UCB u_stat is ACT.
- 0x1207 — Simplex mode on-line CU SSR has force off-line (SSR_FOFL bit 9) asserted.
- 0x1208 — On-line CU HSR bit 8 (backup maintenance channel bit) asserted.
- 0x1209 — On-line CU HSR bit 8 or bit 9 (backup maintenance channel bits) asserted.
- 0x120a — Call to kconfig fltdrvr to remove other CU unsuccessful.
- 0x120b — On-line CU SSR IO disable (SSR_DSAB bit 30) asserted.
- 0x120c — On-line CU SSR isolate DMA from MAS bus (SSR_ISOD bit 20) asserted.
- 0x120d — Off-line CU SSR initialization sequence control bits (SSR_ISC0 or SSR_ISC1 bits 4 and 5) asserted.
- 0x1300 — On-line CU SSR is in enable update mode (SSR_UPD bit 19 asserted) but off-line CU SSR has isolate other (on-line) CU from main store bus (SSR_ISOU bit 21) asserted.
- 0x1301 — Call to kconfig fltdrvr to remove other CU unsuccessful.
- 0x1302 — Off-line CU SSR is in enable update mode (SSR_UPD bit 19 asserted) or off-line CU SSR has isolate other (on-line) CU from main store bus (SSR_ISOU bit 21) asserted.
- 0x1303 — Call to PCPAUD initofl to initialize off-line CU unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x1304 — Call to `kconfig fltdrvr` to remove other CU unsuccessful.
- 0x1305 — Simplex on-line CU SSR in enable update mode (SSR_UPD bit 19 asserted).
- 0x1306 — On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR_ISOUI bit 21 not asserted).
- 0x1307 — 3B21D CUs only: On-line CU SSR not isolating its expansion slots from its main store bus (SSR_ISOIE bit 22 not asserted).
- 0x1308 — 3B21D CUs only: Off-line CU SSR not isolating its expansion slots from its main store bus (SSR_ISOIE bit 22 not asserted).
- 0x1309 — Call to `PCPAUD initofl` to initialize off-line CU unsuccessful.
- 0x1400 — On-line CU UCB `u_update` is OFF (not updated).
- 0x1401 — Call to `ECD lla_rdget` to get on-line CU UCB unsuccessful.
- 0x1402 — Call to `ECD lla_uprid` to change on-line CU UCB `u_update` to ON (updated) unsuccessful.
- 0x1403 — Off-line CU UCB `u_stat` is Standby (STBY), but off-line CU UCB `u_update` is OFF (not updated) or on-line CU SSR is not in enable update mode (SSR_UPD bit 19 not asserted).
- 0x1404 — Call to `kconfig fltdrvr` to remove other CU unsuccessful.
- 0x1405 — On-line CU SSR not in enable update mode (SSR_UPD bit 19 not asserted), but off-line CU UCB `u_update` is ON (updated).
- 0x1406 — Call to `ECD chucb` to change off-line CU UCBs `u_update` to OFF unsuccessful.
- 0x1500 — 3B20D CUs only: Duplex configuration, but on-line CU SSR indicating simplex (SSR_SIDU bit 2 not asserted).
- 0x1501 — 3B20D CUs only: Same as 0x1500 except off-line CU SSR indicating simplex (SSR_SIDU bit 2 not asserted).
- 0x1502 — Simplex configuration but on-line CU indicating duplex (SSR_SIDU bit 2 asserted).
- 0x1503 — Off-line CU SSR has force on-line (SSR_FONL bit 10) asserted.
- 0x1504 — On-line CU SSR forced on-line (SSR_FONL bit 10) asserted, off-line CU SSR forced off-line (SSR_FONL bit 9) not asserted).
- 0x1505 — On-line CU SSR forced on-line (SSR_FONL bit 10) not asserted, off-line CU SSR forced off-line (SSR_FONL bit 9) asserted.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x1506 — Both CU SSRs indicate they are CU 1 (SSR_CCID bit 0 asserted).
- 0x1507 — Both CU SSRs indicate they are CU 0 (SSR_CCID bit 0 not asserted).
- 0x1508 — Off-line CU SSR has power clear (SSR_PCLR bit 15) asserted.
- 0x1509 — Call to PCPAUD initofl to initialize off-line CU unsuccessful.
- 0x150a — Off-line CU has HSR bit 8, 9, or 31 asserted.
- 0x150b — Call to PCPAUD initofl to initialize off-line CU unsuccessful.
- 0x150c — Call to ECD gnxt unsuccessful in on-line CU UCB chain.
- 0x150d — Calls to ECD gnxt did not find a CC UCB (u_dtype=DEV_CC) in the on-line CU UCB chain.
- 0x150e — Call to ECD gnxt unsuccessful in off-line CU UCB chain.
- 0x150f — Calls to ECD gnxt did not find a CC UCB (u_dtype=DEV_CC) in the off-line CU UCB chain.
- 0x1510 — On-line CU 1 CC 0 UCB does not have u_opccid (bit 4) asserted in u_equip.
- 0x1511 — On-line CU 0 CC 0 UCB has u_opccid (bit 4) asserted in u_equip.
- 0x1512 — Off-line CU 0 CC 0 UCB has u_opccid (bit 4) asserted in u_equip.
- 0x1513 — Off-line CU 1 CC 0 UCB does not have u_opccid (bit 4) asserted in u_equip.
- 0x1514 — 3B20D CUs only: Duplex configuration, but on-line CU CC 0 UCB specifying simplex (u_opsimdup bit 6 not asserted in u_equip).
- 0x1515 — 3B20D CUs only: Duplex configuration, but off-line CU CC 0 UCB specifying simplex (u_opsimdup bit 6 not asserted in u_equip).
- 0x1516 — 3B20D CUs only: Simplex configuration, but CU CC 0 UCB specifying duplex (u_opsimdup bit 6 asserted in u_equip).
- 0x1517 — On-line CU SSR has power clear (SSR_PCLR bit 15) asserted.
- 0x1518 — Call to ECD lla_rldget to get on-line CU MASC UCB unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

	0x1519 — Call to ECD <code>lla_rdget</code> to get off-line CU MASC UCB unsuccessful.
	0x151a — 3B20D CUs only: On-line CU memory controller type indicators inconsistent between the SSR (SSR_VLMAS bit 1) and the MASC UCB.
	0x151b — 3B20D CUs only: Off-line CU memory controller type indicators inconsistent between the SSR (SSR_VLMAS bit 1) and the MASC UCB.
	0x151c — Call to <code>kconfig fltdrvr</code> to remove other CU unsuccessful.
	0x151d — Call to ECD <code>lla_rdget</code> to get off-line CU UCB unsuccessful.
	0x1600 — CU 0 and CU 1 EAI data buffers mismatch.
	0x1601 — Call to PCPAUD <code>getoflipb</code> to read off-line CU EAI Initialization Parameter Buffer (IPB) unsuccessful.
	0x2000 — Memory comparison did not complete its entire memory block comparison.
	0x2001 — Call to <code>kconfig rptrerr</code> unsuccessful.
	0x2002 — Call to <code>kconfig rptrerr</code> unsuccessful.
	0x2003 — Call to <code>kconfig fltdrvr</code> to remove other CU unsuccessful.
i	Complemented off-line SSR value (asserted = 1).
j	Complemented on-line SSR value (asserted = 1).
k	Explanation of error - see Audit Appendix C, APP:AUD-C.
l	Explanation of error - see Audit Appendix D, APP:AUD-D.
	NOTE: See Audit Appendixes A and B, APP:AUD-A and APP:AUD-B, for assorted parsing errors when the IM catalog is not active.
m	Explanation of error - see Audit Appendix B, APP:AUD-B.
n	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. See the CIC Select Code 304-046 *System Maintenance Manual* for additional information on audits. The list contains some actions to specific error codes. If the message persists, contact your next level of technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Error: Action:

- 4 — Run ECD 1 audit.
- 6 — Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
- 8 — Run CU diagnostics, switch CUs, run CU diagnostics.
- 14 — Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
- 16 — Take action on this error only if it occurs repeatedly. Run CU diagnostics.
- 18 — Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
- 20 — Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
- 24 — Run Plant Measurements System (PMS) 1 audit.
- 30 — Run CU diagnostics, switch CUs, run CU diagnostics.
- 42 — Clear the EAls with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.
- 44 — Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.

AUD ENV=RTR DADC a ABORTED CODE d

AUD ENV=RTR DADC a ERROR e REPORT
DATA1 X'f DATA2 X'g
DATA3 X'h DATA4 X'i

2. REASON FOR OUTPUT

To report the termination status of a Direct Address Data Channel (DADC) audit and/or any errors found while executing the audit. All DADC audits are concerned with the TSN <--> RNA + LID translation that takes place on the 3B processor.

3. VARIABLE FIELD DEFINITIONS

- a Audit member number:
- 1 — Recalculate 3B hash values and compare these with 1B disk file hash values.
 - 2 — Compare 3B hash values with 1B disk file hash values.
 - 3 — Full pump of 3B DADC translators from 1B disk file.
- b Number of errors found.
- c Number of errors corrected.
- d Audit abort code:
- 3 — Audit was aborted without completing work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not restart or dispatch the audit.
 - 6 — An error was encountered in the audit Control/audit library interface.
 - 7 — Audit exceeded timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

e

Error code:

- 1 — Failed to enable system messages.
 - f — 0 - Not used.
 - g — 0 - Not used.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 2 — Failed initialization sequence from SIM.
 - f — Size of init_msg.
 - g — Aud_init return code.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 3 — Failed getting DAmaster port ID.
 - f — DAmaster port ID.
 - g — Return code from getport.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 4 — Failed to get existing data segment.
 - f — Segment virtual address index.
 - g — 0 - Not used.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 5 — Bad Operating System Trap (OST) initialization.
 - f — Ostinit return code.
 - g — DAmaster process ID.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 101 — Bad incore data, will escalate to pump.
- 200 — Changed value in 3B for 1B trunk scanner number-data link translator address (TSN-DLTA) value.
THIS IS NOT AN ERROR CONDITION - ONLY A REPORT.
 - f — Old value TSN.
 - g — New value TSN.
 - h — 1B disk address for change.
 - i — 3B virtual address for change.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 201 — Changed value in 3B for DLTA-TSN value.
THIS IS NOT AN ERROR CONDITION - ONLY A REPORT.
- f — Old value DLTA.
 - g — New value DLTA.
 - h — 1B disk address for change.
 - i — 3B virtual address for change.
- 210 — Failed to read 1B disk TSN-DLTA head table.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 212 — Failed to read 1B disk DLTA-TSN head table.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 213 — Failed to make new segment.
- f — Segment virtual address index.
 - g — Requested size of segment.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 214 — Failed read of 1B disk hash head table.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 215 — Failed read of 1B hash entry.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 216 — Failed read of 1B hash value.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 217 — Failed read of 1B subtranslator.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 218 — Failed read of DLTA-TSN hash entry.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 219 — Failed read of DLTA-TSN hash value.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 220 — Failed read of DLTA-TSN subtranslator.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 221 — Bad incore data, will escalate to pump.
- 301 — Failed to make new segment.
- f — Segment virtual address index.
 - g — Requested size of segment.
 - h — 0 - Not used.
 - i — 0 - Not used.
- 302 — Cannot allocate enough memory for new segment.
- f — Requested size of segment.
 - g — Size segment returned.
 - h — Segment virtual address index.
 - i — 0 - Not used.
- 303 — DAmaster failed to add segment.
- f — DAmaster process ID.
 - g — Segment name.
 - h — Segment virtual address index.
 - i — Segment size.
- 304 — Failed to read TSN-DLTA head table.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.
- 305 — Failed to read DLTA-TSN head table.
- f — File descriptor.
 - g — Address of memory for read.
 - h — Return code from read.
 - i — System errno.

SEE PROPRIETARY NOTICE ON COVER PAGE

306 — Failed to read 1B disk hash head table.

f — File descriptor.
g — Address of memory for read.
h — Return code from read.
i — System errno.

307 — No subtranslators found in head table.

f — 1 — DLTA-TSN subtranslator.
2 — TSN-DLTA subtranslator.
g — 0 - Not used.
h — 0 - Not used.
i — 0 - Not used.

308 — Failed read of 1B DLTA-TSN subtranslator.

f — File descriptor.
g — Address of memory for read.
h — Return code from read.
i — System errno.

309 — Failed read of 1B DLTA-TSN value.

f — File descriptor.
g — Address of memory for read.
h — Return code from read.
i — System errno.

310 — Failed read of 1B TSN-DLTA subtranslator.

f — File descriptor.
g — Address of memory for read.
h — Return code from read.
i — System errno.

311 — Failed read of 1B TSN-DLTA value.

f — File descriptor.
g — Address of memory for read.
h — Return code from read.
i — System errno.

312 — DAmaster failed to add segment.

f — DAmaster process ID.
g — Segment name.
h — Segment virtual address index.
i — Segment size.

314 — No subtranslators found in head table.

f — 1 — DLTA-TSN subtranslator.
2 — TSN-DLTA subtranslator.
g — 0 - Not used.
h — 0 - Not used.
i — 0 - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

315 — Failed read of 1B DLTA-TSN subtranslator.

- f — File descriptor.
- g — Address of memory for read.
- h — Return code from read.
- i — System errno.

4. ACTION TO BE TAKEN

Error codes 200 and 201 report whenever a value changes between 1B disk and 3B memory. After a 1B recent change that affects the DADC translators, this report should be expected.

For other errors in DADC audits 1 and 2, the software will escalate to a full DADC 3, which is a full pump of the translators.

For errors in DADC 3, seek technical assistance.

Issue 9.4
September 2001

2. REASON FOR OUTPUT

To report the termination status of the D-Channel Node (DCN) application audit and/or any errors found.

3. VARIABLE FIELD DEFINITIONS

- a Audit member. One of the following:
- 1 — Data Blocks audit.
 - 2 — User call reference value (CRV) Table audit.
 - 3 — Network CRV Table audit.
 - 4 — Channel ID Table audit.
 - 5 — Idle Data Blocks List audit.
- b DCN group number.
- c DCN member number.
- d Audit Mode. One of the following:
- MAN — Manual mode
 - ROUT — Routine mode
 - SOFT — Software mode
 - UNK — Unknown mode
- e Total number of errors found.
- f Total number of errors corrected.
- g Error code. One of the following:
- 1 — User CRV out of range.
 - 2 — Network CRV out of range.
 - 3 — CRV Table entry is idle.
 - 4 — Data Block index out of range.
 - 5 — Data Block is idle.
 - 6 — Link mismatch.
 - 7 — CHID mismatch.
 - 8 — CRV mismatch.
 - 9 — Invalid channel type.
 - 10 — CHID out of range.
 - 11 — Link out of range.
 - 12 — Data Block index mismatch.
 - 13 — Idle Data Block List's head and tail mismatch.
 - 14 — Data Block is in wrong idle list.
 - 15 — Data Block is not idle.
 - 16 — Data Block's previous link mismatch.
 - 17 — Data Block's next list mismatch.
 - 18 — Next Data Block is in wrong idle list.
 - 19 — Next Data Block is not idle.
 - 20 — Next Data Block's previous link mismatch.
 - 21 — Idle Data Block List's tail mismatch.
 - 22 — Dangling idle Data Blocks.

4. ACTION TO BE TAKEN

Format 1 indicates successful execution. Seek technical assistance if errors occur or mode is UNK.

Format 2 indicates that other audit is active. The OP:DCNAUD input message can be used to determine the current audit status.

Format 3 indicates that the audit is already active. The OP:DCNAUD input message can be used to determine the current audit status.

Format 4 indicates that the Audit Control Mechanism on the DCN is under initialization. Wait until DCN finishes initialization and retry.

Format 5 indicates that the audit number is not valid.

Format 6 indicates that the audit found an error. Seek technical assistance.

Format 7 indicates that the requested node is not a DCN. Retry with a correct group and member number for the DCN.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 8 indicates that the DCN is not active. Wait until the DCN is active and retry.

Format 9 indicates that DCNAP cannot send message to the DCN. Retry. If you get the same error multiple times, seek technical assistance.

Format 10 indicates that DCNAP received returned or source matched messages. Either the IMS channel is not open on the DCN or the DCN is not active.

2. REASON FOR OUTPUT

To report the termination status of the DLN application audit and /or any errors found.

3. VARIABLE FIELD DEFINITIONS

- a Audit member:
- 1 — Compare DLN and 1B hash words.
 - 2 — Compare DLN and 1B ACI/ISUP translation data.
 - 3 — DLN performs hash of its ACI/ISUP translation data.
- b DLN group number.
- c DLN member number.
- d Total number of errors found.
- e Total number of errors corrected.
- f Abort code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
- g Error code:
- 1 — Invalid audit type.
 - 2 — Invalid DLN ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 3 — DLN not in service or has no translation data.
- 4 — Invalid disk address for hash data.
- 5 — Invalid translation address for translation data.
- 6 — Invalid number of binks.
- 7 — DLN pump is in progress.
- 8 — DLN update is in progress.
- 9 — Unable to seize Binkmap.
- 10 — DLN-DLNCM communication (protocol) failure.
- 11 — Failed to correct errors via a DLN pump or update.
- 20 — Failed to get the ECD logdev record for the 1B file (/dev/1afile0 or /dev/1afile1) (see Table III).
- 21 — DLNCM sync'ed to the wrong 1B file - correction started via DLNCM task SWITCH_1B (see Table IV).
- 30 — Translation data word error (see Table I).
- 40 — Hash word error (see Table II).
- 701 — Failed to send a DLN BUFSTAT dma command.
Data word 1: DLN ring node address.
Data word 2: DLN IMS state - OOS(0) ACT(1).
Data word 3: DLN CNI state.
 - OOS — 0
 - ACT — 1
 - OFL — 2
 - STBY — 3Data word 4: Return code from the dma command (senddln()).
- 702 — Invalid DLN dma response buffer.
Data word 1: DLN ring node address.
Data word 2: Dma buffer job field.
Data word 3: Dma buffer job response field.
Data word 4: Return code from the dma command (senddln()).
- 703 — DLN in CNI state OOS or OFL or STBY found scanning the APIDLN stream.
Data word 1: DLN ring node address.
Data word 2: DLN CNI state.
 - OOS — 0
 - ACT — 1
 - OFL — 2
 - STBY — 3Data word 3: DLN scanning status from the DLN.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x8000 — DLN is scanning out.

0x0080 — DLN is scanning in.

Data word 4: Return code from stopping the stream.

704 — Two way or one way in DLN has improper scan status.

Data word 1: DLN ring node address.

Data word 2: DLN CNI mode field.

TWOWAY — 1

1WAYIN — 2

1WAYOUT — 3

Data word 3: DLN scanning status from the DLN.

0x8000 — DLN is scanning out.

0x0080 — DLN is scanning in.

Data word 4: APIDLN DLN stream status.

0xf — Scan both directions active.

0x5 — Scan out direction active.

0xa — Scan in direction active.

705 — Two way or one way out DLN has improper scan status.

Data word 1: DLN ring node address.

Data word 2: DLN CNI mode field.

TWOWAY — 1

1WAYIN — 2

1WAYOUT — 3

Data word 3: DLN scanning status from the DLN.

0x8000 — DLN is scanning out.

0x0080 — DLN is scanning in.

Data word 4: APIDLN DLN stream status.

0xf — Scan both directions active.

0x5 — Scan out direction active.

0xa — Scan in direction active.

4. ACTION TO BE TAKEN

Seek technical assistance if errors occur.

Table I - DLN Audit 2

Data word 1: 1B disk address of hash word.

Data word 2: 1B hash word.

Data word 3: DLN hash word.

Data word 4: Bink number.

Table II - DLN Audit 1

Data word 1: 1B disk address of bink.

Data word 2: Word offset.

Data word 3: 1B translation word.

Data word 4: DLN translation word.

Table II - DLN Audit 3

Data word 1: Bink number.

Data word 2: DLN expected hash word.

Data word 3: DLN calculated hash word.

Data word 4: Zero value.

Table III - DLN Audit 1 Error 20

Data word 1: Return code from function `f_1adevid()` (`init.c`).

Data word 2: Active 1B file `mdct` record pointer.

Data word 3: Active 1B file partition number.

Data word 4: 0.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table IV - DLN Audit 1 Error 21

Data word 1: Active 1B file mdct record pointer.

Data word 2: Active 1B file partition number.

Data word 3: Correct 1B file mdct record pointer.

Data word 4: Correct 1B file partition number.

DATA 1 X'00000000 DATA 2 X'00000000
DATA 3 X'00000000 DATA 4 X'00000000

2. REASON FOR OUTPUT

To report the termination status of the DLNCM audit and /or any errors found.

3. VARIABLE FIELD DEFINITIONS

- a Audit member (1).
- b Total number of errors found.
- c Total number of errors corrected.
- d Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
- e Error code:
 - 1 — Invalid procedure number for task.
 - 2 — Invalid status for task.
 - 3 — Wrong number of tasks for DLNCM.
 - 4 — Clock procedure is not running.
 - 5 — Attached Processor Interface (API) device guard timer out of range.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6 — DLN device guard timer out of range.
- 7 — API device guard timer is zero and the overall API device fault counter is non zero.
- 8 — API device guard timer is zero and a specific API device fault counter is non zero.
- 9 — DLN device guard timer is zero and the overall DLN device fault counter is non zero.
- 10 — DLN device guard timer is zero and a specific DLN device fault counter is non zero.
- 11 — Interprocess Message Switch Driver (IMSDRV) process is not in normal gear shift mode and DLNCM is not at cause. It is normal for the IMSDRV process to be in high gear while Restoring (RST) a node such as a SADC node. Therefore, the appearance of this report in conjunction with a node restoral is just informational and not a cause for concern.
Data word 1: IMSDRV gear shift value.
 - 1 — normal gear - 50 msec tick.
 - 2 — high gear - 20 msec tick.
 - 3 — critical gear - 20 msec tick.
- 101 — A DLN is scanning the API-DLN stream when it shouldn't (stream should be down).
- 102 — A API is scanning the API-DLN stream when it shouldn't (stream should be down).
- 110 — An API isn't scanning the API-DLN stream when it should (stream should be up).
- 111 — A DLN isn't scanning the API-DLN stream when it should (stream should be up).
- 112 — The API-DLN stream header pointer is corrupt.
Data word 1: Pointer corrupt value.
Data word 2: Pointer correct value.
- 113 — The DLN stream status word contains trash.
Data word 1: Contents of the dlncstat word.
Data word 2: Mask of valid area.
- 114 — The API stream status word contains trash. This is a non-correctable error as only the Attached Processor Driver (APDRV) has write access to this word.
Data word 1: Contents of the apistat word.
Data word 2: Mask of valid area.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 201 — A DLN is in a transient state for more than 2 minutes - the DLN is removed from service.
Data word 1: DLN ring node address.
Data word 2: DLN IMS state.
- 0 — OOS.
 - 1 — ACT.
- Data word 3: DLN Common Network Interface (CNI) state.
- 0 — OOS.
 - 1 — ACT.
 - 2 — OFL.
 - 3 — STBY.
- Data word 4: DLN CNI mode.
- 1 — TWOWAY.
 - 2 — 1WAYIN.
 - 3 — 1WAYOUT.
- 202 — More than 1 active DLN in the OUT direction DLN(s) in data words 2-4 are removed from service.
Data word 1: Outgoing DLN rna (retained).
Data word 2: Outgoing DLN rna (removed).
Data word 3: Outgoing DLN rna or 0 (removed).
Data word 4: Outgoing DLN rna or 0 (removed).
- 203 — More than 1 active DLN in the IN direction DLN(s) in data words 2-4 are removed from service.
Data word 1: Incoming DLN rna (retained).
Data word 2: Incoming DLN rna (removed).
Data word 3: Incoming DLN rna or 0 (removed).
Data word 4: Incoming DLN rna or 0 (removed).
- 204 — No DLN(s) found in the incoming or outgoing state NONCORRECTED error as other detection/correction mechanisms should fire (heartbeat on the 1B processor).
Data word 1: Number of outgoing DLN(s).
Data word 2: Number of incoming DLN(s).
Data word 3: 1B processor communication status.
- 0 — Communicating with the 1B processor.
 - 1 — Not communicating with the 1B processor.
- Data word 4: API-DLN stream header dln scanning status.
- 206 — Unknown DLN CNI STATE see data words for error 201.
- 207 — Unknown DLN CNI MODE see data words for error 201.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 210 — Failure connecting to the Equipment Configuration Database (ECD) - this may indicate core corruption within seg 0x460000 (/illalib) or seg 0x5c0000 (/ecdlib) - a non corrected error.
- 211 — Failed to fetch ECD ucb record for a DLN - a non corrected error.
Data word 1: DLN ring node address.
Data word 2: ECD rid that failed `lla_get()`.
Data word 3: ECD setid for ucb records.
- 212 — ECD ucb DLN status is OOS but CNI ims state is not OOS - this could be a transient condition as CNI may not have responded to an IMS node removal - non corrected error.
Data word 1: DLN ring node address.
Data word 2: DLN ECD rid.
Data word 3: DLN ECD ucb status.
- 0 — ACT.
 - 1 — STBY.
 - 2 — UNAV.
 - 3 — OFL.
 - 4 — OOS.
 - 5 — UNEQIP.
 - 6 — INIT.
 - 7 — GROW.
- Data word 4: DLN IMS state.
- 0 — OOS.
 - 1 — ACT.
- 213 — ECD ucb DLN status is ACT but CNI imsstate is no ACT - the DLN is removed. See data words for error 201.
- 301 — TCAP-TN Q head is non-zero and out of range.
Data word 1: Value of TCAP-TN Q head.
- 302 — TCAP-TN Q link is non-zero and out of range.
Data word 1: Address of TCAP-TN Q element.
Data word 2: Address of next (bad) TCAP-TN Q element.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 303 — TCAP-TN Q element on Q is not in a Q state.
Data word 1: Address of TCAP-TN Q element.
Data word 2: Contents of the state field.
- 0 — IDLE (available).
 - 1 — LOAD (being loaded by AMA).
 - 2 — Q (on Q waiting for a DLN).
 - 3 — UNLOAD (being unloaded by a DLN).
 - 4 — AUDLK (locked for audits).
- 304 — TCAP-TN Q element on Q more than once.
Data word 1: Address of TCAP-TN Q element.
Data word 2: Q element number.
- 305 — TCAP-TN Dload variable is non-zero and out of range. This is the buffer being loaded by AMA. The variable is set to zero.
Data word 1: Contents of TCAP-TN Dload variable.
- 306 — TCAP-TN buffer in the Q state and the Q is empty. The buffer is moved to the IDLE state.
Data word 1: Address of the TCAP-TN buffer.
- 307 — TCAP-TN buffer in the Q state and not on the Q list. The buffer is moved to the IDLE state.
Data word 1: Address of the TCAP-TN buffer.
- 308 — More than one TCAP-TN buffer in the LOAD state. The buffer is moved to the IDLE state.
Data word 1: Address of the TCAP-TN buffer.
Data word 2: Contents of the Dload variable.
Data word 3: 2.
- 309 — TCAP-TN variable Dload does not point to buffer in the LOAD state. The buffer ID moved to the IDLE state.
Data word 1: Contents of the Dload variable.
Data word 2: Address of the TCAP-TN buffer.
- 310 — TCAP-TN variable Dload is zero and a buffer exists in the LOAD state. Variable Dload is set to point to the buffer.
Data word 1: Contents of variable Dload.
Data word 2: Address of the TCAP-TN buffer.
- 311 — More than one TCAP-TN buffer in the UNLOAD state. The buffer is moved to the idle state.
Data word 1: Address of the TCAP-TN buffer.
Data word 2: Number of buffers in the UNLOAD state.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 312 — Audit TCAP-TN buffer accounting does not match the number of TCAP-TN buffers allocated. Non-corrected error.
Data word 1: Number of buffers in the IDLE state.
Data word 2: Number of buffers in the LOAD state.
Data word 3: Number of buffers in the Q state.
Data word 4: Number of buffers in the UNLOAD state.
- 313 — TCAP-TN scanner tasks DLNOUT should be running but is not. Start the task.
Data word 1: Number of buffers in the IDLE state.
- 314 — All TCAP-TN buffers are idle and the DLNOUT scanner task is still running. Stop the task from running.
Data word 1: Procedure number of the DLNOUT task.
Data word 2: DLNCM task number of DLNOUT.
- 401 — There is an open capability number with the File Manager (FMGR) and the associated task is zero. The correcting action is to close the capability number with the FMGR.
Data word 1: Index into DLNCM file descriptor table.
Data word 2: Address of DLNCM file descriptor table.
Data word 3: Capability number.
- 402 — There is a task on the open DLNCM file table with a zero capability number. The correcting action is to zero the task process ID from the file table.
Data word 1: Index into DLNCM file descriptor table.
Data word 2: Address of DLNCM file descriptor table.
Data word 3: Task process ID.
- 403 — There is an open capability number with the File Manager (FMGR) and the associated task is non-existent. The correcting action is to close the capability number with the FMGR and zero out the task process ID in the DLNCM file table.
Data word 1: Index into DLNCM file descriptor table.
Data word 2: Address of DLNCM file descriptor table.
Data word 3: Task process ID.
Data word 4: Capability number.
- 404 — There is a non-existing task ID on the open DLNCM file table with a zero capability number. The correcting action is to zero the task process ID from the file table.
Data word 1: Index into DLNCM file descriptor table.
Data word 2: Address of DLNCM file descriptor table.
Data word 3: Task process ID.
Data word 4: Capability number.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 405 — The file descriptor has been in a transient reserved state for two iterations of the audit. The correcting action is to zero the process number and task process ID from the file table.
Data word 1: Index into DLNCM file descriptor table.
Data word 2: Address of DLNCM file descriptor table.
Data word 3: Task process ID.
Data word 4: Capability number.
- 601 — The DLNCM - ARTS DLN error printing threshold is out of range.
- 701 — Invalid CNI initialization level.
- 702 — Static hash is corrupted.
- 703 — Configure_dlms flag is corrupt (no ring initialization is in progress).
- 704 — Configure_dlms flag is corrupt (ring initialization is in progress).

4. ACTION TO BE TAKEN

Seek technical assistance if errors occur.

2. REASON FOR OUTPUT

To report the termination status of the Equipment Configuration Database (ECD) audit and/or any errors found.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Audit member: 1 — Structural incore ECD audit. 2 — Structural disk ECD audit. 3 — Raw data incore ECD audit.
b	Instance name (appears only when a = 2). APPECD — Application ECD. ECD — DMERT only ECD.
c	Total number of errors found.
d	Total number of errors corrected.
e	Abort code: 3 — Audit was aborted without completing its work. 4 — Audit was faulted while correcting errors. 5 — System Integrity Monitor (SIM) could not start or dispatch the audit. 6 — An error was encountered in the audit control/audit library interface. 7 — Audit exceeded its timeout or segment limit. 8 — SIM aborted an executing routine audit because of a blocking request. 9 — Transient process that was running the process terminated. 10 — A segmented audit exceeded an error threshold.
f	Error code: (1-2999) — LLA structural error. (3000-3999)— Fatal error. (4000-4999)— Error. (5000-5999)— Correction.
g	Explanation of error identified by error code. If error code is 1-2999, see the APP:LLA appendix. If error code is 3000-5999, see the Table.
h	Explanation of error; see Audit Appendix C, APP:AUD-C.
i	Explanation of error; see Audit Appendix D, APP:AUD-D.
j	Explanation of error - see Audit Appendix B, APP:AUD-B.
k	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Audit Appendixes A and B, APP:AUD-A and APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the audit was manually run in the noncorrecting mode and the output indicates that corrections are needed, rerun the audit in correcting mode.

NOTE: That recent changes should not be applied while an audit that uses the ECD is running.

Seek technical assistance if errors occur.

Format 1 has an OMDB key of 78.

Formats 2 and 3 have an OMDB key of 76.

Format 4 has an OMDB key of 52.

Format 5 has an OMDB key of 64.

Format 8 has an OMDB key of 720.

The OMDB keys apply to the error codes listed in the Table.

Error codes 3000, 3001, 3003, 3004, 3007, 3008, 3009, 3011 through 3016, 3022, 4006, 4007, and 4008 have an OMDB key of 459.

Error codes 3002, 3010, and 3017 through 3020 have an OMDB key of 458.

Error code 3021 has an OMDB key of 607.

Error code 3024 has an OMDB key of 459 if it is associated with format 4.

Error code 3024 has an OMDB key of 720 if it is associated with format 8.

Error codes 4000, 4002, 4004, and 4005 have an OMDB key of 457.

Error code 4001 has an OMDB key of 456.

Error code 4003 has an OMDB key of 455.

Error codes 4009 through 4014 have an OMDB key of 619.

Error code 5000 has an OMDB key of 454.

Error code 5001 has OMDB keys of 454 and 459.

Table

Error Code:	Explanation:
3000	Cannot open incore ECD, errno = x.
3001	'malloc' failure, errno = x.
3001	'malloc' failure.
3002	Read failure for z, errno = x.
3002	Read failure for z.
3003	Audit ECD z has more records than incore ECD.
3004	Incore ECD has more records than audit ECD z.
3005	'lla_rldget' failure for incore ECD to check RCV semaphore.
3006	Audits blocked during RCV session - try later.
3007	'lla_ainit' failure for structural audit.
3008	'lla_irel' failure for incore ECD.
3009	'lla_dbrel' failure for z.
3010	Cannot open disk ECD z, errno = x.
3010	Cannot open disk ECD z.
3011	'lla_nsqrld' failure for z.
3012	'getport' failure, errno = x.
3013	'getseg' failure, errno = x.
3014	'lla_iatt' failure for incore ECD.
3015	'lla_opensq' failure for incore ECD.
3016	Audit copy z corrupted.
3017	fopen failure for z, errno = x.
3017	fopen failure for z.
3018	fread failure for z, errno = x.
3018	fread failure for z.
3019	fseek failure for z, errno = x.
3019	fseek failure for z.
3020	fwrite failure for z, errno = x.
3020	fwrite failure for z.
3021	The incore ECD does not match the disk ECD z.
3022	Driver PID notification table out of space, entries = x.
3023	makeseg failure - cannot create new segment.
3024	If this error code is associated with format 4 then Cannot run audit in corr mode while ABD is active. (Note: Active ABD means that system is operating with an ABD selected.) If this error code is associated with format 8 then Audits blocked during offline boot - try later.
4000	'lla_rinfo' failure for z, RID = y.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table (continued)

Error Code:	Explanation:
4001	Incore RID does not match audit (z) RID.
4002	'lla_rdget' failure for z, RID = y.
4003	Record size of incore ECD does not match record size of audit z.
4004	Record type of incore does not match audit z, RID = y.
4005	'lla_uprid' failure for z, RID = y.
4006	Local copy record changes: unable to notify driver, PID = x.
4007	Possible inconsistency (structure corrected) of disk ECD z.
4008	Structural audit cannot continue without previous corrections.
4009	UCB a b c d points down to a UCB which does not point back up for z.
4010	UCB a b c d has incorrect UP0 pointer for its side chain for z.
4011	UCB a b c d has incorrect UP1 pointer for its side chain for z.
4012	UCB a b c d points down to the beginning of a side chain loop for z.
4013	UCB a b c d should not have a side pointer for z.
4014	UCB a b c d points down to itself for z.
5000	Record corrected, RID = y, record = z. Incore record data will be followed by audit record data.
5001	Record needs correction, RID = y, record = z. Incore record data will be followed by audit record data. For LLA audit error messages reference file w.

a = UCB complex unit
 b = UCB unit
 c = UCB complex unit
 d = UCB name
 w = file name:
 /etc/log/ecdaud-disk - for disk audit
 /etc/log/ecdaud-struct - for structural incore audit
 /etc/log/ecdaud-raw - for raw audit
 x = integer
 y = hexadecimal integer
 z = database name

- [7] AUD ENV=RTR ECDOWN 1 AUTOMATICALLY j

2. REASON FOR OUTPUT

To report the termination status of the ECDOWN audit and /or any errors found.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

d	Error code: Error (100-199) Correction (200-200)
e	Supplementary data block number.
f	An explanation of the error identified by the error code. See Table.
g	Explanation of error - see the Output Audit Appendix C, APP:AUD-C.
h	Explanation of error - see the Output Audit Appendix D, APP:AUD-D.
i	Explanation of error - see Audit Appendix B, APP:AUD-B.
j	Inhibited status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was manually run in the noncorrecting mode and the output indicates that corrections are needed, rerun the audit in correcting mode.

Note that recent changes should not be applied while an audit that uses the ECD is running.

Seek technical assistance if errors occur.

2. REASON FOR OUTPUT

To report the termination status of the task queue audit (FMGR 1) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

	8 — SIM aborted an executing routine audit because of a blocking request.
	9 — Transient process that was running the process terminated.
	10 — A segmented audit exceeded an error threshold.
	12 — Audit rejected the request to run from SIM.
	13 — SIM aborted an executing audit because the audit system is being reinitialized.
d	Error code: 2 — Invalid taskid field. 3 — Invalid sleep address. 4 — Invalid task stack pointer. 5 — Invalid message pointer. 6 — Task too old. 7 — Invalid task time stamp.
e	Address of the error: pointer to the task header information.
f	Erroneous data value.
g	Error index: used to identify the error.
h	Corrected data value.
i	Explanation of error - the Output Audit Appendix C, APP:AUD-C.
j	Explanation of error - the Output Audit Appendix D, APP:AUD-D.
k	Explanation of error - see Audit Appendix B, APP:AUD-B.
l	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

- [16] AUD ENV=RTR FMGR 4 AUTOMATICALLY w

2. REASON FOR OUTPUT

To report the termination status of the file table audit (FMGR 4) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

- | | |
|----------|---|
| a | Total number of errors found. |
| b | Total number of errors corrected. |
| c | Abort code: |
| | 3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit.
8 — SIM aborted an executing routine audit because of a blocking request.
9 — Transient process that was running the process terminated.
10 — A segmented audit exceeded an error threshold.
12 — Audit rejected the request to run from SIM.
13 — SIM aborted an executing audit because the audit system is being initialized. |
| ERROR 31 | Error code. Invalid flag field. |
| d | Address of the error: pointer to the file table entry. |
| e | Erroneous data value. |
| f | Error index: used to identify the error. |
| g | Corrected data value. Flag field. |
| ERROR 32 | Error code. Invalid pointer to associated incore inode table entry. |
| h | Corrected data value. Valid inode pointer (if one exists). |
| ERROR 33 | Error code. Invalid pointer to associated internal capability table entry. |
| i | Corrected data value. Valid capability table entry (if one exists). |
| ERROR 34 | Error code. Invalid pointer to the next file table entry on the chain. |
| j | Corrected data value. Pointer to the next file table entry on its chain. |

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 35	Error code. Invalid taskid.
k	Corrected data value. NULL.
ERROR 36	Error code. Use count of open files does not match the number of associated capabilities.
l	Error index: used to identify the error: 1 — Associated capability table chain is bad. 2 — Use count is incorrect.
m	Corrected data value. Depends on the error index value, if the error index value is: 1 — Then this value means the capability table must be audited and then the file table re-audited. 2 — Then this value is the correct use count.
ERROR 39	Error code. Incorrect count of file table entries currently in use - Nfile.
n	Corrected data value. Correct number of file table slots in use.
ERROR 40	Error code. Invalid free list.
o	Error index: used to identify the error: 1 — Free chain broken or looped. 2 — Non-free entry on free chain. 3 — Free entry not on chain. 4 — Invalid tail pointer.
ERROR 90	Error code. Invalid file table size - Filtabsz.
p	Corrected data value. Correct file table size.
ERROR 91	Error code. Invalid degrowth page marker.
q	Corrected data value. Correct start of degrowth page.
r	Error code.
s	Corrected data value.
t	Explanation of error - see Output Audit Appendix C, APP:AUD-C.
u	Explanation of error - see Output Audit Appendix D, APP:AUD-D.
v	Explanation of error - see Output Audit Appendix B, APP:AUD-B.
w	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

If the error code is 33 or 36, run the capability table audit.

2. REASON FOR OUTPUT

To report the termination status of the internal capability table audit (FMGR 5) and /or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a	Total number of errors found.
b	Total number of errors corrected.
c	Abort code: 3 — Audit was aborted without completing its work. 4 — Audit was faulted while correcting errors. 5 — System Integrity Monitor (SIM) could not start or dispatch the audit. 6 — An error was encountered in the audit control/audit library interface. 7 — Audit exceeded its timeout or segment limit. 8 — SIM aborted an executing routine audit because of a blocking request. 9 — Transient process that was running the process terminated. 10 — A segmented audit exceeded an error threshold. 12 — Audit rejected the request to run from SIM. 13 — SIM aborted the executing audit because the audit system is being reinitialized.
ERROR 41	Error code. Nonexistent process.
d	Address of the error: pointer to the file table entry.
e	Erroneous data value.
f	Corrected data value if correcting audit. NULL.
ERROR 42	Error code. Invalid file table pointer.
g	Corrected data value if correcting audit. Pointer to the file table entry associated with this capability.
ERROR 43	Error code. Invalid pointer to the next capability table entry on the chain.
h	Corrected data value if correcting audit. Pointer to the next capability table entry on the chain.
ERROR 44	Error code. Invalid capability pointer in file table entry.
i	Error index: used to identify the error. 1 — Value when error is not corrected. 2 — File table entry's capability pointer restored. 3 — File table entry not in use - capability removed.

SEE PROPRIETARY NOTICE ON COVER PAGE

j	Corrected data value if correcting audit. Current value of file table entry's capability pointer.
ERROR 45	Error code. Invalid capability chain.
k	Corrected data value if correcting audit. Next entry on capability chain.
ERROR 46	Error code. Incorrect count of capability table entries currently in use - Ncap.
l	Corrected data value if correcting audit. Correct number of capability entries currently in use.
ERROR 47	Error code. Invalid free list.
m	Error index: used to identify the error.
	1 — Free chain broken or looped.
	2 — Non-free entry on free chain.
	3 — Free entry not on chain.
	4 — Invalid tail pointer.
ERROR 48	Error code. Incorrect capability table size.
n	Corrected data value if correcting audit. Correct capability table size.
ERROR 49	Error code. Incorrect degrowth page marker.
o	Corrected data value if correcting audit. Correct start of degrowth page.
p	Error code.
q	Corrected data value if correcting audit.
r	Explanation of error - see Output Audit Appendix C, APP:AUD-C.
s	Explanation of error - see Output Audit Appendix D, APP:AUD-D.
t	Explanation of error - see Output Audit Appendix B, APP:AUD-B.
u	Inhibit status:
	ALLOWED — Audit has been automatically allowed by SIM.
	INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode.

In addition, run the file table audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOTE: If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

2. REASON FOR OUTPUT

To report the termination status of the buffer audit (FMGR 6) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

a	Total number of errors found.
b	Total number of errors corrected.
c	Abort code: 3 — Audit was aborted without completing its work. 4 — Audit was faulted while correcting errors. 5 — System Integrity Monitor (SIM) could not start or dispatch the audit. 6 — An error was encountered in the audit control/audit library interface. 7 — Audit exceeded its timeout or segment limit. 8 — SIM aborted an executing routine audit because of a blocking request. 9 — Transient process that was running the process terminated. 10 — A segmented audit exceeded an error threshold. 12 — Audit rejected the request to run from SIM. 13 — SIM aborted an executing audit because the audit system is being reinitialized.
ERROR 51	Error code. Free list chain is broken.
d	Address of the error. Pointer to the file table entry.
e	Erroneous data value.
f	Error index: used to identify the error. 1 — Forward chain is bad. 2 — Backward chain is bad.
g	Corrected data value. NULL.
ERROR 52	Error code. Device chain is broken.
h	Error index: used to identify the error. 1 — Buf's forward device chain is broken. 2 — Buf's backward device chain is broken. 3 — Bdevtab's forward device chain is broken. 4 — Bdevtab's backward device chain is broken.
ERROR 54	Error code. Invalid free list chain pointer.
i	Error index: used to identify the error. 1 — Forward chain pointer is bad. 2 — Backward chain pointer is bad. 3 — Both chain pointers are bad.

SEE PROPRIETARY NOTICE ON COVER PAGE

j	Corrected data value. Pointer to itself (this problem will be repaired later in the audit).
ERROR 55	Error code. Invalid device chain pointer.
k	Error index: used to identify the error. 4 — Forward chain pointer is bad. 8 — Backward chain pointer is bad. c — Both chain pointers are bad. Any value greater than X'C reflects the number of forward or backward chain errors.
ERROR 56	Error code. Invalid buffer pointer.
l	Error index: used to identify the error.
m	Corrected data value. Correct buffer pointer.
ERROR 57	Error code. Invalid mount table pointer.
n	Error index: used to identify the error: 1 — Mount chain is bad. 2 — Invalid flag/mount pointer combination.
o	Corrected data value. Depends on the error index value, if the error index value is: 1 — Then this value is the pointer to mount table, if any, associated with the buffer, or it is NULL. 2 — Then this value is NULL.
ERROR 58	Error code. Invalid taskid.
ERROR 61	Error code. Invalid taskid/ilock combination.
ERROR 62	Error code. Invalid taskid/flock combination.
ERROR 59	Error code. Buffer is too old.
ERROR 60	Error code. Invalid time stamp.
p	Corrected data value. Current system time.
ERROR 64	Error code. Invalid total number of free inodes.
q	Address of the error. Pointer to the superblock.
r	Offset in superblock to s_tinode.
s	Correct total number of free inodes.
t	Explanation of error - see Output Audit Appendix C, APP:AUD-C.
u	Explanation of error - see Output Audit Appendix D, APP:AUD-D.
v	Explanation of error - see Output Audit Appendix B, APP:AUD-B.

SEE PROPRIETARY NOTICE ON COVER PAGE

w

Inhibit status:

ALLOWED — Audit has been automatically allowed by SIM.

INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

2. REASON FOR OUTPUT

To report the termination status of the mount table audit (FMGR 7) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 12 — Audit rejected the request to run from SIM.
 - 13 — SIM aborted an executing audit because the audit system is being reinitialized.
- ERROR 72 Error code. Buffer error.
- d Address of the error: pointer to the mount table entry.
- e Erroneous data value.
- f Error index: used to identify the error.
- 1 — Buf table entry associated with the mount table does not have the B_MOUNT flag set.
 - 2 — Invalid buf pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

g	Corrected data value. Depends on the error index value, if the error index value is: 1 — Then this value is the flags field of the associated buf table entry. 2 — Then this value is the pointer to the associated buf table entry.
ERROR 74	Error code. Inode error.
h	Error index: used to identify the error. 1 — Inode table entry associated with the mount table does not have the I_MOUNT flag set. 2 — Invalid inode pointer.
i	Corrected data value. Depends on the error index value, if the error index value is: 1 — Then this value is the flags field of the associated inode table entry. 2 — Then this value is the pointer to the associated inode table entry.
ERROR 75	Error code. Invalid inode.
j	Error index: used to identify the error.
k	Corrected data value. Pointer to the root inode.
l	Corrected data value. NULL.
ERROR 77	Error code. Invalid taskid.
m	Error code.
n	Corrected data value.
o	Explanation of error - see Output Audit Appendix C, APP:AUD-C.
p	Explanation of error - see Output Audit Appendix D, APP:AUD-D.
q	Explanation of error - see Output Audit Appendix B, APP:AUD-B.
r	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in noncorrecting mode and failures occur, rerun the audit in correcting mode. If the messages continue to appear (rolling audit messages) after the audit is run in correcting mode, contact your next level of technical support.

- [7] AUD ENV=RTR FMGR 9 AUTOMATICALLY l

2. REASON FOR OUTPUT

To report the termination status of the message queue audit (FMGR 9) and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

ERROR 81	Error code. There are too many messages (message blocks) on the file manager's queue.
d	NULL.
e	Erroneous data value.
f	Error index: used to identify the error.
g	Corrected data value: ten times the number of tasks (160).
h	Error code.
i	Explanation of error - see Output Audit Appendix C, APP:AUD-C.
j	Explanation of error - see Output Audit Appendix D, APP:AUD-D.
k	Explanation of error - see Output Audit Appendix B, APP:AUD-B.
l	Inhibit status: - ALLOWED — Audit has been automatically allowed by SIM. - INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A, and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If failure occurs, run the file manager's task queue audit in noncorrecting mode.

NOTE: If the messages appear regularly (i.e. rolling messages) even after the audit has been run in correcting mode, contact your next level of technical support.

2. REASON FOR OUTPUT

To report the termination status of the file system block audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

- a Audit member. RTR audits have the value 1, but application audits may be greater than 1.
- b Name of the file system that was audited.
- c Total number of errors found.
- d Total number of errors corrected.
- e Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

f

Error code:

- 1 — Bad superblock label.
- 2 — Bad file mode.
- 3 — Bad file size.
- 4 — Bad block (block out of file system block range).
- 5 — Duplicate block number.
- 6 — Bad address block (address block contains invalid block addresses).
- 7 — Temporary file found in filesystem when audit invoked with PARAM=BACKUP. This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action that is possible or needed for this condition.
- 8 — Audit library initialization failed.
- 9 — Unable to open device file.
- 10 — Unable to start device file.
- 11 — Device file not a block device.
- 12 — Unable to open device file.
- 13 — Unable to queue a message.
- 14 — Unable to add segments.
- 15 — Unable to read superblock.
- 16 — Unable to access block (or get buffer to read block).
- 17 — Unable to get a free block.
- 18 — Unable to access inode.
- 19 — Unable to remove a segment.
- 20 — Cannot mount the device.
- 21 — Unable to get bitmap segment ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 22 — Bitmap I/O failed.
- 26 — The device file is open for writing.
- 35 — File manager segment list is full.

ERROR 1

- g Not used.
- h File system label.
- i Not used.
- j Not used.

ERROR 2

- g Inode number (index into inode table).
- h File mode.
- i Index used to locate error.
- j Not used.

ERROR 3

- g Inode number (index into inode table).
- h Incorrect file size.
- i File type:
 - 1 — Regular file direct block.
 - 2 — Single indirect file.
 - 3 — Double indirect file.
 - 4 — Triple indirect file.
 - 5 — Extent file.
- j New file size, if corrected; otherwise, old file size.

ERROR 4

- g Inode number (index into inode table).
- h Bad block number.
- i Block or file type:
 - 1 — Regular file direct block.
 - 2 — Single indirect file.
 - 3 — Double indirect file.
 - 4 — Triple indirect file.
 - 5 — Extent file.
- j New block number if corrected; otherwise, old block number.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 5

- g Inode number.
- h Duplicate block number.
- i Block or file type:
- 1 — Regular file direct block.
 - 2 — Single indirect block.
 - 3 — Double indirect block.
 - 4 — Triple indirect block.
 - 5 — Extent file.
- j New block number if corrected; otherwise, old block number.

ERROR 6

- g Inode number.
- h Bad or duplicate block number.
- i 0x000000AB indicating block or file type. A and B may have the values:
- A = 0 — The block is a data block.
 - 1 — The block is an address block.
 - B = 1 — Regular file direct block.
 - 2 — Single indirect block.
 - 3 — Double indirect block.
 - 4 — Triple indirect block.
 - 5 — Extent file.
- j New block number if corrected; otherwise, old block number.

ERROR 7

- g Inode number.
- h Not used.
- i Not used.
- j Not used.

ERROR 8

- g Not used.
- h Not used.
- i Index used to locate error.
- j Not used.

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 14

g	Segment index into file manager's segment table.
h	Error returned from attempt to add segment.
i	Size in bytes of the segment to be added.
j	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 16

g	Block number.
h	Error returned.
i	Index used to locate error.
j	Inode number of current inode.

ERROR 17

g	Inode number of current inode.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 18

g	Inode number.
h	Error returned on attempt to access.
i	Index used to locate error.
j	Not used.

ERROR 19

g	Index in file manager's segment list.
h	Zero or error returned from attempt to remove the segment.
i	Indicates reason for failure: 000c — Failed to allocate a message. 000d — Failed to queue the message. 0013 — Request to remove the segment failed; error returned is found in h.
j	Not used.

ERROR 20

g	Not used.
h	Not used.
i	Index with the values: 000a — No free mount table entry. 000b — Unable to read superblock.
j	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 21

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 22

g	Not used.
h	Error returned from I/O attempt.
i	Index used to locate error.
j	Not used.

ERROR 26

g	Inode number of device file.
h	Number of opens for writing on the device.
i	Record Identification (RID) of the Minor Device Chain Table (MDCT) for the file system on which the device file resides.
j	Partition for the file system on which the device file resides.

ERROR 35

g	Not used.
h	Not used.
i	Index used to locate error
j	Not used.
k	For explanation of error, see output Audit Appendix C, APP:AUD-C.
l	For explanation of error, see output Audit Appendix D, APP:AUD-D.
m	For explanation of error, see output Audit Appendix B, APP:AUD-B.
n	Inhibit status:

ALLOWED — Audit has been automatically allowed by SIM.

INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See output Audit Appendix A, APP:AUD-A, and output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4,

Error codes ERROR 1 and ERROR 2 are not correctable. Back up the file system from a backup source.

For size and block errors (error codes ERROR 3, ERROR 4, ERROR 5, and ERROR 6), use the input message OP:FNAME to print the full pathname of the file. To correct the error, rerun the audit in the CORR mode.

For error codes ERROR 8 through ERROR 26, seek technical assistance.

Error code ERROR 35 occurs when the maximum number of file manager tasks are running and using all of the available file manager segment table slots. Rerun the audit at a time when there are no other file system audits running. If the problem persists, execute a level 3 craft initialization. If the problem still persists, create an off-line memory dump tape and seek technical assistance.

2. REASON FOR OUTPUT

To report the termination status of the file system compaction audit and/or errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

- a Audit member. RTR audits have the value 1, but application audits may be greater than 1.
- b Name of the file system that was audited.
- c Total number of error or report messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d Total number of reports for corrected errors and for compaction completed.
- e Abort Code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 12 — Audit rejected the request to run from SIM.
 - 13 — SIM aborted an executing audit because the audit system is being reinitialized.
- f Error code:
- 1 — Bad superblock label.
 - 4 — Bad block (block out of file system block range).
 - 5 — Duplicate block number.
 - 6 — Bad address block (address block contains invalid block addresses).
 - 8 — Audit library initialization failed.
 - 9 — Unable to open device file.
 - 10 — Unable to stat device file.
 - 11 — Device file not a block device.
 - 12 — Unable to allocate a message.
 - 13 — Unable to queue a message.
 - 14 — Unable to add segments.
 - 16 — Unable to access block (or get buffer to read block).
 - 17 — Unable to get a free block.
 - 18 — Unable to access inode.
 - 19 — Unable to remove a segment.
 - 20 — Cannot mount the device.
 - 21 — Unable to get bitmap segment ID.
 - 22 — Bitmap Input/Output (I/O) failed.
 - 23 — No available structures for mapping allocated blocks for the compaction.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 24 — Concurrent file system activity is interfering with the compaction effort.
- 25 — I/O attempt failed.
- 26 — The device file is open for writing.
- 35 — File manager segment list is full.

ERROR 1

- g Not used.
- h File system label.
- i Not used.
- j Not used.

ERROR 4, ERROR 5, ERROR 6

- g Inode number.
- h Bad or duplicate block number.
- i 0x000000AB indicating block and file type, or 0x000000C0 indicating the block usage change that was occurring when the error was detected. A, B, and C have the values:
 - A = 0 — The block is a data block.
 - 1 — The block is an address block.
 - B = 1 — Regular file direct block.
 - 2 — Single indirect block.
 - 3 — Double indirect block.
 - 4 — Triple indirect block.
 - 5 — Extent file.
 - C = 3 — A block was being added to a regular file.
 - 4 — A block was being removed from a regular file.
 - 5 — Blocks were being added to a multi-extent or contiguous file.
 - 6 — Blocks were being removed from a multi-extent or contiguous file.
- j If i is of the form 0x000000AB, the new block number if corrected; otherwise, old block number. If i is of the form 0x000000C0, the number of block usage errors found before termination of the audit.

ERROR 8

- g Not used.
- h Not used.
- i Index used to locate error.
- j Not used.

i	Index used to locate error.
j	Not used.

ERROR 14

g	Segment index into file manager's segment table.
h	Error returned from attempt to add segment.
i	Size in bytes of the segment to be added.
j	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 16

g	Block number.
h	Error returned.
i	Index used to locate error.
j	Inode number of current inode.

ERROR 17

g	Inode number of current inode.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 18

g	Inode number.
h	Error returned on attempt to access.
i	Index used to locate error.
j	Not used.

ERROR 19

g	Index in file manager's segment list.
h	Zero or error returned from attempt to remove the segment.
i	Indicates reason for failure: 000c — Failed to allocate a message. 000d — Failed to queue the message. 0013 — Request to remove the segment failed, error returned is found in h.
j	Not used.

ERROR 20

g	Not used.
h	Not used.
i	Index with the values: 000a — No free mount table entry. 000b — Unable to read superblock.
j	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 21

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 22

g	Not used.
h	Error returned from I/O attempt.
i	Index used to locate error.
j	Not used.

ERROR 23

g	Inode number.
h	First block number to be mapped.
i	0x000000AB indicating block or file type, or 0x000000C0 indicating the block usage change that was occurring when the error was detected. A, B, and C have the values: A = 0 — The block is a data block. 1 — The block is an address block. B = 1 — Regular file direct block. 2 — Single indirect block. 3 — Double indirect block. 4 — Triple indirect block. 5 — Extent file. C = 3 — A block was being added to a regular file. 4 — A block was being removed from a regular file. 5 — Blocks were being added to a multi-extent or contiguous file. 6 — Blocks were being removed from a multi-extent or contiguous file.
j	If i is of the form 0x000000AB, first block number to be mapped. If i is of the form 0x000000C0, the number of errors found before termination of the audit.

ERROR 24

g	Number of relocations needed at the beginning of an interval.
h	Number of relocations needed at the end of the interval.
i	Number of I/O read/write jobs already executed to achieve compaction.
j	Number of errors found before termination of the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 25

- g Type of I/O:
- 1 — Attempt to read file system blocks failed.
 - 2 — Attempt to write file system blocks failed.
 - 3 — Attempt to update inodes failed.
- h Error returned on read or write attempt.
- i If g is 1 or 2, the starting block address. If g is 3, the inode number.
- j If g is 1 or 2, the number of blocks. If g is 3:
- 0001 — The inode is not in a temp'd state, or the incore copy of the temp'd inode is being updated.
 - 0002 — The disk copy of a temp'd inode is being updated.

ERROR 26

- g Inode number of device file.
- h Number of opens for writing on the device.
- i Mdct-rid for the file system on which the device file resides.
- j Partition for the file system on which the device file resides.

ERROR 35

- g Not used.
- h Not used.
- i Index used to locate error
- j Not used.
- k Data report code:
- 2 — This report is generated for three conditions: 1) compaction was requested in non-correcting (information only) mode, 2) compaction was requested in either correcting or non-correcting mode and could not complete because of non-corrected errors, or 3) compaction was requested in correcting mode and the projected number of contiguous blocks that could be freed is less than or equal to the current number of contiguous free blocks.
 - 3 — Compaction was completed, and the fields are for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

DATA 2

g	Total number of free blocks.
h	Projected number of contiguous free blocks after compaction.
i	Current maximum number of contiguous free blocks.
j	Projected cost of compaction in number of relocations required. If the audit is internally aborted before the cost of compaction could be estimated, this field will be 0xffffffff. If the audit is internally aborted after some compaction effort has been made, this field is the number of I/O read/write jobs already executed before the internal abort.

DATA 3

g	Total number of free blocks.
h	Number of contiguous free blocks at end of file system after compaction.
i	Maximum number of contiguous free blocks before compaction.
j	Cost of compaction in number of I/O read/write jobs executed. If this field is zero, the file system requires no compaction.
l	For explanation of error, see output Audit Appendix C, APP:AUD-C.
m	For explanation of error, see output Audit Appendix D, APP:AUD-D.
n	For explanation of error, see output Audit Appendix B, APP:AUD-B.
o	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See output Audit Appendix A, APP:AUD-A, and output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, 6, and 7, no action is necessary.

For Format 4,

Error code 1 is not correctable. Back up the file system from backup source.

For block errors (error codes 4, 5, and 6), run the block audit in non-correcting mode. If it finds errors, run the block audit in correcting mode. Then try this audit again.

For error codes 8 through 23, 25, and 26, seek technical assistance.

For error code 24, run this audit with reduced file system activity.

SEE PROPRIETARY NOTICE ON COVER PAGE

Error code 35 occurs when the maximum number of file manager tasks are running and using all of the available file manager segment table slots. Rerun the audit at a time when there are no other file system audits running. If the problem persists, execute a level 3 craft initialization. If the problem still persists, create an off-line memory dump tape and seek technical assistance.

2. REASON FOR OUTPUT

To report the termination status of file system link audit and/or any errors found during the audit execution.

3. VARIABLE FIELD DEFINITIONS

- a Audit member. RTR audits have the value 1, but application audits may be greater than 1.
- b Name of the file system that was audited.
- c Total number of errors.
- d Total number of reports for corrected errors and for compaction completed.
- e Abort Code:
3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — System Integrity Monitor (SIM) could not start or dispatch the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the audit terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

f

Error code:

- 1 — Bad superblock label.
- 2 — Trashed inode in the inode table.
- 3 — Bad directory entry.
- 4 — Bad directory block (block out of file system block range).
- 5 — Bad link count (link count in inode not same as number of references in directories).
- 6 — Unreferenced inode.
- 7 — Link count of the directory inode is less than two.
- 8 — Audit library initialization failed.
- 9 — Unable to open device file.
- 10 — Unable to stat device file.
- 11 — Device file not block device.
- 12 — Unable to allocate a message.
- 13 — Unable to queue a message.
- 14 — Unable to add segments.
- 16 — Unable to access block (or get buffer to read block).
- 18 — Unable to access inode.
- 19 — Unable to remove a segment.
- 20 — Cannot mount the device.
- 26 — The device file is open for writing.
- 27 — Current directory entry could not be referenced from the parent directory.
- 28 — Current directory entry cannot reference its parent directory.
- 29 — Current directory entry has a bad inode.
- 30 — References to a free inode.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 31 — Current directory has more than one parent directory.
- 32 — Current directory is not reachable from file system root.
- 33 — Active but unreferenced file in filesystem when audit invoked with PARAM=BACKUP. This condition does not represent an actual file system error, but if a backup tape is made with this condition present, the backup tape could contain file system errors. There is no corrective action provided or needed for this condition.
- 35 — File manager segment list is full.

ERROR 1

- g Not used.
- h File system label.
- i Not used.
- j Not used.

ERROR 2

- g Inode number (index into inode table).
- h Inode number from inode table entry.
- i Not used.
- j Not used.

ERROR 3

- g Inode number (index into inode table).
- h Inode number in the directory entry.
- i File type of directory:
 - 1 — Regular file direct block.
 - 2 — Single indirect block.
 - 3 — Double indirect block.
 - 4 — Triple indirect block.
 - 5 — Extent file.
- j Corrected directory inode number if corrected; otherwise, inode number in the directory entry.

ERROR 4

- g Inode number (index into inode table).
- h Bad block number.
- i Not used.
- j Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 5

g	Inode number.
h	Bad link count of the inode.
i	Not used.
j	CORRECTED (if correcting audit) or CORRECT link count.

ERROR 6

g	Inode number.
h	Bad link count of the inode.
i	For non-correcting audit, not used.
	For correcting audit, correcting type:
	0 — The unreferenced inode was zeroed out.
	1 — The unreferenced inode was written into a lost+found directory.
j	If non-correcting mode, the number of links from the file system. If correcting mode and the file was zero length, the file is removed and this value is zero; otherwise, the file is linked into the lost+found directory and this value will be non-zero and the corrected number of links from the file system.

ERROR 7

g	Inode number.
h	Link count in inode.
i	Not used.
j	Not used.

ERROR 8

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 9

g	Not used.
h	Error returned from attempt to open.
i	Index used to locate error.
j	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 10

g	Not used.
h	Error returned from attempt to get status.
i	Index used to locate error.
j	Not used.

ERROR 11

g	Not used.
h	File type.
i	Index used locate error.
j	Not used.

ERROR 12

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 13

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.

ERROR 14

g	Segment index into file manager's segment table.
h	Error returned from attempt to add segment.
i	Size in bytes of the segment to be added.
j	Not used.

ERROR 16

g	Block number.
h	Error returned.
i	Index used to locate error.
j	Inode number of current inode.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 18

- g Inode number.
- h Error returned on attempt to access.
- i Index used to locate error.
- j Not used.

ERROR 19

- g Index in file manager's segment list.
- h Zero or error returned from attempt to remove the segment.
- i Indicates reason for failure:
 - 000c — Failed to allocate a message.
 - 000d — Failed to queue the message.
 - 0013 — Request to remove the segment failed, error returned is found in h.
- j Not used.

ERROR 20

- g Not used.
- h Not used.
- i Index with the values:
 - 000a — No free mount table entry.
 - 000b — Unable to read superblock.
- j Not used.

ERROR 26

- g Inode number of device file.
- h Number of opens for writing on the device.
- i Minor Device Chain Table (MDCT) Record Identification (RID) for the file system on which the device file resides.
- j Partition for the file system on which the device file resides.

ERROR 27

- g Inode number.
- h Bad link count of the inode.
- i Correction type:
 - 1 — Not corrected - aborted. Parent inode should be two, but it is not.
 - 2 — Corrected. Parent inode should be two, but it is not.
 - 3 — Not corrected - aborted. Parent inode is not a directory.

SEE PROPRIETARY NOTICE ON COVER PAGE

	4 — Corrected. Parent inode is not a directory, but all files under the parent inode have written into the lost+found directory.
	5 — Unable to make the correction. Unable to write into the lost+found directory.
	6 — Corrected. Corrupted inode has been written into the lost+found directory.
j	Value. Zero if unknown; otherwise, the bad inode number.
ERROR 28	
g	Current directory inode number.
h	Bad link count of the inode.
i	Not used.
j	Parent directory inode number.
ERROR 29	
g	Inode number.
h	Bad link count of the inode.
i	Not used.
j	Bad inode number.
ERROR 30	
g	Inode number with invalid references.
h	Not used.
i	Not used.
j	Zero if corrected; otherwise, number of invalid references.
ERROR 31	
g	Inode number.
h	Parent inode originally specified by (. .) in current directory.
i	Not used.
j	Not used.
ERROR 32	
g	Inode number.
h	Parent inode originally specified by (. .) in current directory.
i	Not used.
j	Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 33

g	Inode number.
h	Number of active opens on this inode.
i	Not used.
j	Process ID of a process (there may be others) with the inode open.

ERROR 35

g	Not used.
h	Not used.
i	Index used to locate error.
j	Not used.
k	For explanation of error, see output Audit Appendix C, APP:AUD-C.
l	For explanation of error, see output Audit Appendix D, APP:AUD-D.
m	For explanation of error, see output Audit Appendix B, APP:AUD-B.
n	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See output Audit Appendix A, APP:AUD-A, and output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

For Formats 1, 2, 3, 5, and 6, no action is necessary.

For Format 4, the action to be taken depends on the error code.

Error codes ERROR 1, ERROR 2, ERROR 4, and ERROR 7, are usually not correctable. Before backing up the file system from the backup source, rerun the audit in the correcting mode; this may correct some of the errors.

For error codes ERROR 3, ERROR 5, and ERROR 27 through ERROR 32, use the input command OP:FNAME to print the full pathname of file. To correct errors, rerun the audit in the Correcting (CORR) mode. If the audit has detected multiple errors, then file system corruption has occurred. Save a copy of all FSLINK audit error messages and seek technical assistance.

For error code ERROR 6, the unreferenced file cannot be reached in the file system by any name. To correct errors, rerun the audit in the Correcting (CORR) mode.

SEE PROPRIETARY NOTICE ON COVER PAGE

For error codes ERROR 8, ERROR 12, ERROR 13, ERROR 14, ERROR 16, ERROR 18, ERROR 19, and ERROR 20, check disk status and/or system resource usage. Rerun audit when the system is quiet and the disks are active. Disk access error or system resource access error has occurred.

For error codes ERROR 9, ERROR 10, and ERROR 11, check and repair or create a device file that defines the file system. The device file is non-existent or the wrong type.

For error codes ERROR 15 and ERROR 17, seek technical assistance.

For error code ERROR 26, rerun the audit later. If error persists, seek technical assistance.

Error code ERROR 35 occurs when the maximum number of file manager tasks are running and using all of the available file manager segment table slots. Rerun the audit at a time when there are no other file system audits running. If the problem persists, execute a level 3 craft initialization. If the problem still persists, create an off-line memory dump tape and seek technical assistance.

The correcting mode may not correct all errors. For further investigation, contact your next level of technical assistance.

NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

Prints in response to the executing of LKBDST audit, which audits the consistency of basic link and band status information, both in the 3B computer and IUN. Unless stated otherwise, any data item found in error is corrected and no other action taken.

This audit may have been executed due to:

- Routine schedule.
- Manual request.

If this audit has been executed by routine scheduling and no errors were found, no output is generated. The output generated in other cases is described in the following.

Format 1 prints when any of the following conditions occur:

- A. The audit is manually requested on a specified node and no errors are found. Here, Fields a and b are set to zero. Refer to the input command to determine the identity of the node audited.
- B. The audit is manually requested on a specified node and errors are found. Here, both Format 1 and Format 4 messages are printed. Fields a and b in Format 1 are set to zero.
- C. The audit is manually requested and no node is specified and no errors are found. Here, fields a and b are set to zero. The node is picked by the system and its identity is not available at the time of output in Format 1.

SEE PROPRIETARY NOTICE ON COVER PAGE

- D. The audit is manually requested and no node is specified and errors are found. Here, both Format 1 and Format 4 messages are printed. Fields a and b in Format 1 are set to the number of errors found.
- E. The audit is automatically scheduled and errors are found. Here both Format 1 and Format 4 messages are printed. Fields a and b in the Format 1 message are set to the number of errors found.

Format 2 prints when the LKBDST audit is stopped.

Format 3 prints when the LKBDST audit is aborted.

Format 4 prints when any of the following conditions occur:

- A. The audit is manually requested on a specified node and errors are found. Here, both Format 1 and Format 4 are printed. Field DATA1 in the Format 4 message contains the identity of the node audited.
- B. The audit is manually requested and no node is specified and errors are found. Here both Format 1 and Format 4 messages are printed. Field DATA1 in Format 4 contains the identity of the node audited.
- C. The audit is automatically scheduled and no errors are found. Here both Format 1 and Format 4 messages are printed. Field DATA1 in Format 4 contains the identity of the node audited.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|---|
| a | Total number of errors found (maximum 16.). |
| b | Total number of errors corrected (maximum 16). |
| c | Abort code: <ul style="list-style-type: none">3 — Audit was aborted without completing its work.4 — Audit was faulted while correcting errors.5 — SIM could not start or dispatch the audit.6 — An error was encountered in the audit control/audit library interface.7 — Audit exceeded its timeout or segment limit.8 — SIM aborted an executing routine audit because of a blocking request.9 — Transient process that was running the process terminated.10 — A segmented audit exceeded an error threshold. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- d Error code for each detected error. This is followed by the appropriate block of raw data (see following). This output is printed for up to 16 errors per audit; if more than 16 errors are found, a 17th block (see d = 200) is added to indicate the number of detected errors. Assigned error codes are:
- 1 — Syntax error in PARAM field of input request.
 - 2 — Group number specified on input request too big.
 - 3 — Comma missing, possible other syntax problem on input request.
 - 4 — Member number on input request no good.
 - 5 — Node number from input request no good.
 - 0 — Internal link status (in-service vs. other) in the 3B computer, used for traffic management.
 - 1 — Internal mate link status (in-service vs. other) in the 3B computer, used for traffic management.
 - 2 — Internal mate link status (in-service vs. other) in IUN, used for traffic management.
 - 3 — Link prove-in state (emergency restart vs. normal) as seen by the CNI.
 - 4 — Route switch table entry for this link, kept in IUN, reflects received TFP, TFR, TFA signals; used to route banded message traffic.
 - 100 - 169 — CCS7 and CCS6 error codes, see the following explanation of variable fields e,f,g,h.
 - 200 — Overflow; indicates total number of errors detected by this audit.
 - 201 — Node audit timeout. Indicates that one or more of the audit response messages from the node was not received. This may occur due to previously reported errors on the node, or due to transient node overload conditions. The ring node address of the node is contained in field e.
 - 300 - 350 — DCHN and SADC error codes, see explanation of variable fields e,f,g, and h.
- e, f, g, h Raw data (in hexadecimal). Meaning depends on field d as follows:

SEE PROPRIETARY NOTICE ON COVER PAGE

If d = 0 - 4

- e — Ring Node Address (RNA) of link node being audited.
- f — Observed (incorrect) value.
- g — Band number (nearest lower multiple of 4) if applicable, else 0.
- h — Reference (correct) value.

If d = 100

- e — Ring node address of link node being audited.
- f — Protocol value found in 3B computer.
- g — Protocol value found in RNA.
- h — 0

If d = 101

- e — Ring node address of link node being audited.
- g — Link type found in 3B computer.
- g — Link type found in RNA.
- h — 0

If d = 102

- e — Ring node address of link node being audited.
- f — Link speed found in 3B computer.
- g — Link speed found in RNA.
- h — 0

If d = 103

- e — Ring node address of link node being audited.

- e — Ring node address of incore LNDATA for LACID
- f — Incore LACID for this RNA/link id
- g — LACID value of LACID table
- h — Link number of incore LNDATA for LACID

4. ACTION TO BE TAKEN

Format 1 requires no action.

Format 2 prints when an execution of the audit is stopped via the AUD:STOP input message or by an initialization of the CNI subsystem.

Format 3 prints only during outages or initializations of the CNI subsystem.

If it occurs when the CNI is operational, seek technical assistance.

Format 4 reports nonfatal errors detected by the audit. Seek technical assistance to determine the cause of the trouble.

All of the errors reported by this audit indicate mutilated internal data or other software problems. Such errors can occur as a side effect of other problems such as hardware faults. If error correction was indicated (b > 0), then the audit attempted to clear the trouble,

SEE PROPRIETARY NOTICE ON COVER PAGE

where possible, either by data correction or by other action. To verify that either action was successful, run the audit again.

2. REASON FOR OUTPUT

To report the termination status of the memory manager audits and /or any errors found.

3. VARIABLE FIELD DEFINITIONS

- a Audit member:
- 1 — Segment descriptor table audit.
 - 2 — Page table audit.
 - 3 — Page descriptor table audit.
 - 4 — Segment release audit.
 - 5 — Segment unlock audit.
 - 9 — Swap space compaction audit.
- b Total number of errors found.
- c Total number of errors corrected.
- d Abort code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit.
 - 9 — Transient process that was running the audit terminated.
 - 10 — A segmented audit exceeded an error threshold.
- e Error code:
- 2 The swap space compaction audit was requested to run in a non-correcting mode, which is meaningless for this audit. If d = 2, fields f through i will be 0, field b will be 1 (1 error found) and c will be 0 (no errors corrected).

SEE PROPRIETARY NOTICE ON COVER PAGE

- 3 The swap space compaction audit was unable to "move" a particular segment. Fields f and g are for information only.
- 10 Incorrect values in one or more. Pointer to first segment descriptor, pointer to last segment descriptor, number of segment descriptors.
- 20 Incorrect values in one or more. Pointer to first page table, pointer to last page table, number of page tables.
- 30 Incorrect values in one or more. Pointer to first page descriptor, pointer to last page descriptor, number of page descriptors.
- 101 Invalid link in the segment descriptor free list.
- 102 Segment descriptor on the free list is allocated.
- 103 Incorrect value in the number of free segment descriptors.
- 104 Segment descriptor free list is circular.
- 105 Segment descriptor on free list not marked on-free-list.
- 106 Free segment descriptor not on the free list.
- 107 Segment descriptor with a valid page table pointer and/or non-zero status not marked allocated.
- 108 Empty page table linked to a segment descriptor that is not page-protected.
- 109 Page table linked to a segment descriptor not marked allocated.
- 110 Invalid page table pointer in a segment descriptor.
- 112 Incorrect segment index in a page descriptor for a page linked to a segment descriptor.
- 113 Incorrect page index in a page descriptor for a page linked to a segment descriptor.
- 114 Incorrect in-memory-page-count in segment descriptor.
- 115 Page descriptor for a page linked to a segment descriptor not marked allocated.
- 116 Invalid page address in page table entry for a segment.
- 118 Segment has pages that overlap.
- 120 Two segments overlap in a page.
- 122 Two segments have the same page table.
- 201 Invalid link in the page table free list.
- 202 Page table on the free list has non-free entries.
- 203 Incorrect value in the number of free page tables.

SEE PROPRIETARY NOTICE ON COVER PAGE

	204	Page table free list is circular.
	205	Page table on free list not marked on-free-list.
	206	Page table lost; not on the free list and not linked to a segment descriptor.
	301	Invalid link index in the list of free pages.
	302	Page on the free list is allocated.
	303	Incorrect value in the number of free pages.
	304	Free page list is circular.
	305	Page descriptor for a page on free list not marked on-free-list.
	306	Lost page; page not on free list and not linked to a segment descriptor.
	401	Breakdown of a segment interrupted.
	501	Old iolocked segment.
ERROR 3

ERROR 109

f Pointer to the segment descriptor.
g Pointer to the page table.
h, i 0 - Not used.

ERROR 110

f Pointer to the segment descriptor.
g Invalid page table pointer.
h, i 0 - Not used.

ERROR 112

f Pointer to the segment descriptor.
g Index into the segment's page table for the page.
h Page number.
i Incorrect segment index.

ERROR 113

f Pointer to the segment descriptor.
g Index into the segment's page table for the page.
h Page number.
i Incorrect page index.

ERROR 114

f Pointer to the segment descriptor.
g Correct in-memory-page-count.
h Incorrect in-memory-page-count in segment descriptor.
i 0 - Not used.

ERROR 115

f Pointer to the segment descriptor.
g Index into the segment's page table for the page.
h Page number.
i 0 - Not used.

ERROR 116 NOT CORR mode:

f Pointer to the segment descriptor.
g Index into the segment's page table for the page.
h The invalid page address.
i 0 - not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 118 NOT CORR mode:

- f Pointer to the segment descriptor.
- g Index of one entry in the page table for the page.
- h Index of the other entry in the page for the page.
- i Page number.

ERROR 120 NOT CORR mode:

- f Pointer to the segment descriptor for the first segment.
- g Pointer to the segment descriptor for the second segment.
- h 00PP00QQ, where PP (00 - 3F) is the index in the page table of the first segment for the common page, and QQ (00 - 3F) is the index in the page table of the second segment for the common page.
- i Page number.

ERROR 122 NOT CORR mode:

- f Pointer to the segment descriptor for the first segment.
- g Pointer to the segment descriptor for the second segment.
- h Pointer to the common page table.
- i 0 - not used.

ERROR 116-ERROR 122 CORR mode:

- f Number of segments with error.
- g Number of non-killable processes that have any of these segments in their address spaces.
- h Number of killable processes that have any of these segments in their address spaces.
- i Number of killable processes that have been terminated.

SUPPLEMENTARY DATA BLOCK NUMBER 1 — each line of four data words describes a serious error.

- j Error codes and corresponding error data:
 - 00000074 (decimal 116) — Invalid page address in an entry of the page table for a segment.
 - k — Pointer to the segment descriptor.
 - l — 000000NN, where NN (00 - 3F) is the index of the entry in the page table.
 - m — The invalid page address.

SEE PROPRIETARY NOTICE ON COVER PAGE

00000076 Overlap of pages within a segment.

- k — Pointer to the segment descriptor.
- l — 000000NN, where NN (00 - 3F) is the index of one entry in the page table for the page.
- m — 000000PP, where PP (00 - 3F) is the index of the other entry in the page table for the page.

00000078 Two segments overlap in a page.

- k — Pointer to the segment descriptor for the first segment.
- l — Pointer to the segment descriptor for the second segment.
- m — 00PP00QQ, where PP (00 - 3F) is the index in the page table of the first segment for the common page, and QQ (00 - 3F) is the index in the page table of the second segment for the common page.

0000007a Two segments have the same page table.

- k — Pointer to the segment descriptor for the first segment.
- l — Pointer to the segment descriptor for the second segment.
- m — Pointer to the common page table.

SUPPLEMENTARY DATA BLOCK NUMBER 2 — Each pair of data words describes a process that contains, in its address space, one or more of the segments with serious errors.

nnnnnnnn Process number of the process.

o Flags describing the process.

- 8 — Process is a special kernel process.
- 4 — Process is non-killable.
- 3 — Process is killable and a termination message has been sent.
- 2 — Process is killable, but no termination message was sent by this audit of the process.

pppp The pcode portion of the utility ID.

ERROR 201

f Invalid page table pointer.

g 0 - not used.

h 0 - not used.

i 0 - not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 202

f	Pointer to the page table.
g	0 - not used.
h	0 - not used.
i	0 - not used.

ERROR 203

f	Correct number of free page tables.
g	Incorrect value in the number of free page tables.
h	0 - Not used.
i	0 - Not used.

ERROR 204

g	0 - Not used.
h	0 - Not used.
i	0 - Not used.

ERROR 205

f	Pointer to the page table.
g	0 - Not used.
h	0 - Not used.
i	0 - Not used.

ERROR 206

f	Pointer to the page table.
g	Pointer to first free page table.
h	0 - Not used.
i	0 - Not used.

ERROR 301

f	Invalid link index.
g	0 - Not used.
h	0 - Not used.
i	0 - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 302

f	Page number of the page.
g	0 - Not used.
h	0 - Not used.
i	0 - Not used.

ERROR 303

f	Correct number of free pages.
g	Incorrect value in the number of free pages.
h	0 - Not used.
i	0 - Not used.

ERROR 304

f	Page number at which error was found.
g	0 - Not used.
h	0 - Not used.
i	0 - Not used.

ERROR 305

f	Page number of the page.
g	0 - Not used.
h	0 - Not used.
i	0 - Not used.

ERROR 306

f	Page number of the page.
g	Page number of first free page.
h	0 - Not used.
i	0 - Not used.

ERROR 401

f	Pointer to a segment descriptor.
g	Status word in segment descriptor.
h	Index into segment descriptor table.
i	0 - Not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 501

f	Pointer to segment descriptor.
g	Age of segment in minutes.
h	Index into segment descriptor table.
i	Utility ID of segment's last owner (not necessarily the process that left the segment locked). 0 indicates the utility ID is not available.
q	Data report code: 1 — Swap space has been compacted, and fields are for information only.

DATA 1

r	Number of holes after compaction.
s	Size of the largest hole after compaction.
t	Number of segments "moved" on the swap disk.
u	Number of segments swapped into memory by the compaction function.
v	Explanation of error - see Output Audit Appendix C, APP:AUD-C.
w	Explanation of error - see Output Audit Appendix D, APP:AUD-D.
x	Explanation of error - see Output Audit Appendix B, APP:AUD-B.
y	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A, and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit was run in non-correcting mode and reported errors, rerun it in correcting mode.

2. REASON FOR OUTPUT

To report the termination status of the Message Buffer (MSGBUF) resources audit and/or any errors found.

NOTE: The high order 16 bits of utility ID indicates process Dispatch Control Table (DCT) index, and the low order 16 bits of utility ID indicates pcode (process code).

NOTE: A NULL utility ID for a queued/dequeued message indicates that the associated process has died.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|---|
| a | Audit member:
1 — Message buffer queue audit.
2 — Message buffer extender block audit. |
| b | Total number of errors found. |
| c | Total number of errors corrected. |
| d | Abort code:
3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.
5 — SIM could not start or dispatch the audit.
6 — An error was encountered in the audit control/audit library interface.
7 — Audit exceeded its timeout or segment limit. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- 8 — System Integrity Monitor (SIM) aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the audit terminated.
- 10 — A segmented audit exceeded an error threshold.
- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

e

Error code:

- 110 — Bad message queue head pointer.
- 111 — Bad message queue link pointer.
- 112 — Allocation bit not set in message extender of queued message.
- 113 — Bad on-queue indicator in message extender of queued message.
- 114 — Allocation bit not set in message header of queued message.
- 115 — Bad message-to-field in message and bad message owner field in message extender.
- 116 — Bad message owner in message extender.
- 117 — Bad message to field in message.
- 118 — Message queue out of order.
- 119 — Old audit fault message queued to a non-killable process.
- 120 — Old audit fault message queued to a killable process.
- 121 — Old queued message (except an old queued audit fault message).
- 122 — Process has a circular message queue.
- 123 — Bad message queue tail pointer.
- 124 — Bad message queue block count.
- 125 — Old acknowledgment message queued to a non-killable supervisor process.
- 126 — Old acknowledgment message queued to a killable supervisor process.
- 200 — Allocated message with an invalid owner field.
- 201 — Old allocated message.
- 214 — Allocated bit not set in message header of allocated message.
- 216 — Queued message with an invalid owner.
- 219 — Old audit fault message queued to a non-killable process.
- 220 — Old audit fault message queued to a killable process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 221 — Old queued message (except an old queued audit fault message).
- 270 — Dequeued message with an invalid owner field.
- 271 — Old dequeued audit fault message owned by a non-killable process.
- 272 — Old dequeued audit fault message owned by a killable process.
- 273 — Old dequeued message (except an audit fault message).
- 274 — Over nine old non-queued messages (excluding audit fault messages) owned by a killable process.
- 290 — Audit fault message response has an invalid message status.
- 291 — Invalid status for a message pointer in an audit fault message response.

ERROR 110

- f Address of the queue head pointer.
- g Bad queue head pointer.
- h Utility ID of process owning queue. Refer to the **NOTES**.
- i Corrected queue head pointer if the error was corrected, 0 if it was not. (0 is also a valid queue head pointer).

ERROR 111

- f Address of the message extender.
- g Bad queue link pointer.
- h Utility ID of process owning queue. Refer to the **NOTES**.
- i Corrected queue link pointer if the error was corrected, 0 if it was not. (0 is also a valid queue link pointer). If the corrected queue link pointer is the same as the bad queue link pointer, then the message extender with the bad link pointer was either marked unallocated or unqueued, and was not put onto the rebuilt message queue.

ERROR 112

- f Address of the message extender.
- g Bad extender flags field.
- h Utility ID of process owning queue. Refer to the **NOTES**.
- i 0 - not used.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

ERROR 119, ERROR 120, ERROR 219, ERROR 220, ERROR 271, ERROR 272, ERROR 290, and ERROR 291 indicate that a process has probably mishandled an audit fault message, notify your next level of technical assistance. It is likely that errors ERROR 201 and ERROR 273 will not be corrected if any of these errors occur.

ERROR 121, ERROR 125, ERROR 126, ERROR 201, ERROR 221, ERROR 273, and ERROR 274 indicate that a process may be having problems in processing its messages. Notify your next level of technical assistance.

ERROR 219, ERROR 220, and ERROR 221 indicate an error in a queued message found by the message extender audit. Run the message queue audit (MSGBUF 1) and if the error is not found and corrected, then run the message extender audit (MSGBUF 2) again.

ERROR 200, ERROR 216, and ERROR 270 indicate a problem in the ownership of a message. This may occur if a breakdown happens in a process termination. Run the Process Administration Audit (PROAD 1) to complete the process termination.

2. REASON FOR OUTPUT

Any errors encountered while auditing the office identification data will be output so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System integrity monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 11 — An audit was blocking a needed demand audit.
 - 12 — Audit rejected a request to run from SIM.
 - 13 — SIM aborted audit, audit subsystem was reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

d

Error code:

- 100 — Unable to open the office data disk file.
- 101 — Read error encountered with the office data disk file.
- 102 — The local CLLI® on disk does not match the 3B computer copy.
- 103 — Invalid local CLLI®.
- 104 — Links cannot use the local CLLI®.
- 105 — The region number on disk does not match the 3B computer copy.
- 106 — Invalid region number.
- 107 — The function number on disk does not match the 3B computer copy.
- 108 — Invalid function number.
- 109 — Links cannot use the local function number as their far-end function number.
- 110 — The point code on disk does not match the 3B computer copy.
- 111 — Invalid point code.
- 112 — The region number contained in the point code does not match the local region number.
- 113 — Links cannot use the local point code as their far-end point code.
- 116 — The international point code on disk does not match the 3B computer copy.
- 117 — Invalid international point code.
- 118 — Links cannot use the international local point code as their far-end point code.
- 119 — Cannot write or create the office data disk file.
- 120 — Invalid version number on disk file.
- 127 — The signal transfer point (STP) indicator flag is not 0.
- 128 — The ANSI Standard Point Code flag on disk does not match the 3B computer copy.
- 129 — The ANSI Standard Point Code flag is invalid.
- 134 — The signaling route set test low priority timer "Srs_low_timer" on disk does not match the 3B computer copy.
- 135 — The signaling route set test low priority timer "Srs_low_timer" is out of range.
- 136 — The signaling route set test low priority timer "Srs_low_timer" is not a multiple of 30.

e

Text string describing the error encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If d 100, 101

According to these error messages, the audit is having difficulty in opening and/or reading the office or link set to multiple point code data disk file. This will be corrected during the audit by creating a new disk file and populating it with the data in the 3B computer. It is suggested that the audit be rerun to verify that this condition no longer exists.

d 102, 105, 107, 110, 116

These errors indicate that the data on disk does not match the data in the 3B computer. If the data in the 3B computer is correct, then doing a recent change that copies 3B computer to disk will remedy the problem. If the disk version is correct, then the data in the 3B computer must be changed via an office data or link set to multiple point code data recent change.

d 103, 106, 108, 111, 112, 117

These errors all indicate that one of the data items is invalid. These can be corrected by doing a recent change of the office data or link set to multiple point code data and modifying the data item in question.

d 104, 109, 113, 118

These are discrepancies between the office data and the link data. If the link data is in error, then doing link data recent changes on the appropriate links should clear up the problems. If the office data is wrong, then a recent change of the office data can be done to modify the item(s) in error.

d 119

According to this error message, the audit is having difficulty in creating or writing the new office data disk file. It is suggested that the audit be rerun and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.

d 120

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

d 127

The STP indicator flag is not 0. The value 0 indicates that the office is not an STP. This can be corrected by performing a CNI level 3 initialization.

SEE PROPRIETARY NOTICE ON COVER PAGE

d 128, 129

The ANSI Standard Point Code flag is invalid. If the flag in the 3B computer is correct, then doing a recent change that copies 3B computer office data to disk will remedy the problem. If the flag in the 3B computer is not correct, then use CNIDBOC's "U" option for office data to change the flag, cDstdpc, to the correct value. A value of 0 means that the office has the AT&T point code format. A value of 1 means that the office has the ANSI point code format. After correcting the 3B flag, perform a recent change that copies 3B computer office data to disk.

d 134

This error indicates that the data on disk does not match the data in the 3B computer. If the data in the 3B computer is correct, then doing a recent change that copies 3B computer to disk will remedy the problem. If the disk version is correct, then the data in the 3B computer must be changed via an office data recent change.

d 135, 136

These errors indicate that one of the data items is out of range or not valid. These can be corrected by doing a recent change of the office data and modifying the data item in question.

SEE PROPRIETARY NOTICE ON COVER PAGE

d

12 — Audit rejected a request to run from SIM.

13 — SIM aborted audit, audit subsystem was reinitialized.

Error code:

200 — Unable to open the link data disk file.

201 — Read error encountered in the link data disk file.

202 — Link data exists for an RPC.

203 — Disk file exists but no data in the 3B computer.

204 — Invalid protocol.

205 — Invalid encryption field.

206 — Invalid link type.

207 — Invalid far-end *STP*.

208 — Inappropriate SYU code.

209 — Inappropriate break-in.

210 — Invalid combined link set.

211 — Invalid mate link.

212 — Mate link is an RPC.

213 — Invalid mate relationship.

214 — Mate links are going to same far-end *STP*.

215 — Invalid CLLI code.

216 — A/E/B/D/W-link has local/mate CLLI code.

217 — A/E/B/D-link has an invalid far-end function.

218 — A/E/B/D-link has local/mate function.

219 — Invalid major state.

220 — Available links can not be self-looped.

221 — Available CCS6 links must have SLKs assigned.

222 — Invalid speed (i.e., does not match protocol).

223 — Invalid vfl field.

224 — Invalid voice access test quadrant.

225 — B/D-link has an invalid far-end region.

226 — Invalid pool number.

227 — No pool but there is a combined pool.

228 — The pool-link table is not consistent with the link data.

229 — Invalid layer number.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 230 — Invalid signaling link code.
- 231 — Invalid link set.
- 232 — No link set but there is a combined link set.
- 233 — A/E/B/D/W-link has an invalid far-end point code.
- 234 — A/E/B/D/W-link has local/ mate point code.
- 235 — The link data in the 3B computer does not match the copy on disk.
- 236 — Links going to the same destination need to have consistent data.
- 237 — The derived data items are incorrect.
- 238 — The linkset-link table is not consistent with the link data.
- 239 — The linkset relation table is not consistent with the link data.
- 240 — There are files in the link data directory which do not conform to the naming convention.
- 241 — The VL assignments as shown in the link data do not match the logical-physical tables.
- 242 — Mate link should be a CCS link.
- 243 — For SADC node, Facility Access Type (FACIL) must be MODEM.
- 244 — Invalid LI4 equipage.
- 245 — Invalid Mate link field.
- 246 — Invalid Link Speed.
- 247 — Invalid Link Facility ID.
- 248 — Invalid Circuit ID number (CIN).
- 249 — Invalid User.
- 250 — Invalid Ring Node Address (RNA) or RNA out of range.
- 251 — For SADC node with MODEM facility, T1FA Control Node (TCN) field must be unassigned.
- 252 — Invalid version number on disk file.
- 253 — Invalid Mate Link Major Field.
- 254 — Mated mate DCHN link should not be in the same node.
- 255 — Inconsistent Primary/Secondary field and Mate link field.
- 256 — Invalid Logical Link ID (LACID).
- 257 — LACID provisioned for link does not match the LACID provisioned on the mate link.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 258 — Mate link must be SECONDARY, since link is provisioned as PRIMARY.
 - 259 — Mate link must be PRIMARY, since link is provisioned as SECONDARY.
 - 260 — Invalid Primary/Secondary field.
 - 261 — Invalid mate link RNA.
 - 262 — Invalid mate link node type.
 - 263 — Invalid facility field.
 - 264 — Invalid medium field (must be SATELLITE or TERRESTRIAL).
 - 265 — Invalid ec_mode field (error correction mode).
 - 266 — Invalid receive queue (rxqlen) and/or transmit queue (txqlen) fields.
 - 267 — Invalid congestion onset threshold field.
 - 268 — Invalid congestion abatement threshold field.
 - 269 — Invalid normal AERM SU error rate threshold (tin_val) field.
 - 270 — Invalid emergency AERM SU error rate threshold (tie_val) field.
 - 271 — Invalid encryption mode.
 - 272 — Invalid re-transmit queue (rxqlen) field.
 - 273 — Invalid screen field.
 - 274 — Invalid far-end region.
 - 275 — Invalid Link Interface (LI) type field.
 - 276 — Invalid N1 limit of Message Signal Unit (MSU) field (n1_msu_rxmt).
 - 277 — Invalid T1 clock mode.
 - 278 — Protocol Timers and Parameters (PTP) data for the RNA is missing.
 - 279 — Invalid Re-Transmission Buffer Size (RXQLEN).
- e Text string describing the error encountered.

4. ACTION TO BE TAKEN

If variable d = 200, 201

These errors indicate problems in opening/reading the link data disk file. These will be corrected in the audit by creating a new file and populating it based on the data in the 3B computer. It is suggested that the audit be re-run in order to insure that this condition no longer exists.

SEE PROPRIETARY NOTICE ON COVER PAGE

If variable d = 202

This error indicates that a link data disk file exists for an RPC. This file should be removed.

If variable d = 203

If the disk file is not needed, remove it. If this link is supposed to have data, then do a link data recent change and add the appropriate information (the old disk file will be over-written with the new data).

If variable d = 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 220, 222, 223, 224, 225, 226, 227, 229, 230, 231, 232, 233, 234, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277

These error messages all indicate that there is some invalid data items in the link data. These can all be corrected by doing a link data recent change and modifying the appropriate field.

If variable d = 221

Available CCS6 links must have an SLK assigned if the logical-physical tables are to be used. The SLK can be assigned using a logical-physical add recent change.

If variable d = 235

Error messages of this type reflect the fact that the data in the 3B computer does not match the data on disk. If the data in the 3B computer is deemed correct, then do a recent change that copies the 3B computer to disk. If however, the data on disk is correct, then do a link data recent change and modify the appropriate fields.

If variable d = 236

These errors are due to the fact that links going to the same far-end function have inconsistent data. The link(s) that are incorrect can be fixed using a link data recent change.

If variable d = 237

Certain items stored in the link data do not appear on the RC form because these items can be derived based on the speed of the link. If these items should become inconsistent with the current speed of the link, doing a link data recent change without changing anything should cause the items to be derived correctly.

If variable d = 239

While scanning through the link data, a linkset relation table will be generated. If the current linkset relation table does NOT match the table just generated, then the existing table will be corrected accordingly. Running the audit again will verify that the table was indeed updated correctly.

If variable d = 240

This error indicates that there are files in the link data directory which do not fit the 'lnXX-X' format. These files should be inspected and corrected accordingly.

SEE PROPRIETARY NOTICE ON COVER PAGE

If variable d = 241

These errors can be corrected by doing a recent change that copies the logical-physical tables to disk. When the logical-physical tables are updated on disk, the VL assignments in the link data will be updated at the same time.

If variable d = 249

This error message indicates that there is an invalid data item in the link data. Doing a link data recent change without changing anything should cause the item to be derived correctly.

If variable d = 252

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

If variable d = 278

This error indicates that the PTP data is missing for the specified RNA. Removing and adding the link node data for the RNA will correct this problem. Running the audit again will verify that the PTP data is indeed added.

If variable d = 279

This error code is the result of one of two possible problems. In both cases it indicates that the re-transmission buffer size is incorrect for the link specified in the "Supplementary Data File" output.

In the first case, if the "Supplementary Data File" output has the format "Link xx-y rxqlen (nnnn) should be 4000", it indicates that Link xx-y is a link in a link set where at least one link within that link set has MEDIUM as satellite and the error correction mode of Basic Error Correction (BEC). Verify that MEDIUM is correct. If MEDIUM is set to satellite for at least one link in the link set, all other links in that link set should have the Re-Transmission Buffer Size (RXQLEN). set to 4000. Use RC/V to make any corrections.

In the second case, if the "Supplementary Data File" output has the format "Link xx-y rxqlen (4000) should be 910", it indicates that there is no link with MEDIUM "satellite" using error correction mode "BEC" is present in the link set. Use RC/V to set the re-transmission buffer to 910.

NOTE: For the second case, verify that Message Transfer Part (MTP) Level 2 and 3 timer values have also been RC to the default values of terrestrial links without any satellite link in the link set.

1. FORMAT

This message has four output formats:

- [1] AUD ENV=RTR NIDATA 3 COMPLETED
 - a ERRORS FOUND
 - b ERRORS CORRECTED
- [2] AUD ENV=RTR NIDATA 3 STOPPED
- [3] AUD ENV=RTR NIDATA 3 ABORTED CODE c
- [4] AUD ENV=RTR NIDATA 3 ERROR d REPORT
 - DATA 1 X'00000000 DATA 2 X'00000000
 - DATA 3 X'00000000 DATA 4 X'00000000
 - SUPPLEMENTARY DATA FILE
 - e

2. REASON FOR OUTPUT

Any errors encountered while auditing the logical-physical translation data will be output so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 11 — An audit was blocking a needed demand audit.
 - 12 — Audit rejected a request to run from SIM.
 - 13 — SIM aborted audit, audit subsystem was reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

d

Error code:

- 300 — The user has not provided these tables to the CNI.
- 301 — Open/read error encountered with the lxp_tab disk file.
- 302 — Open/read error encountered with the pxl_tab disk file.
- 303 — Open/read error encountered with the vl_tab disk file.
- 304 — Open/read error encountered with the ln7slots disk file.
- 305 — The logical-physical data on disk does not match the 3B computer copy.
- 306 — The physical-logical data on disk does not match the 3B computer copy.
- 307 — All CCS6 links in the AVL major state must have an SLK assigned.
- 308 — A link has an SLK assigned but there is no link data for the link.
- 309 — Physical-logical table indicates that the link is CCS7 but the link data is CCS6.
- 310 — The index into the virtual link table is invalid.
- 311 — A link is using an entry in the virtual link table which is marked as unused.
- 312 — The virtual link data on disk does not match the 3B computer copy.
- 313 — A link is using an invalid SLK.
- 314 — An RNA/VL translates to an SLK but the reverse translation does not hold true.
- 315 — A CCS7 link has an entry in the virtual link table but it doesn't have any vl's assigned.
- 316 — Physical-logical table indicates that the link is CCS6 but the link data is CCS7.
- 317 — An SLK translates to an invalid RNA/VL.
- 318 — An SLK translates to a link which is unequipped (i.e., no link data).
- 319 — An SLK translates to a CCS6 link but the virtual link is not 0.
- 320 — An SLK translates to an RNA/VL but the reverse translation does not hold true.
- 321 — An SLK translates to a CCS7 link but no index into virtual link table.
- 322 — An SLK translates to a CCS7 link but the virtual link is invalid.
- 323 — The ln7slots data on disk does not match the 3B computer copy.
- 324 — Invalid value in the ln7slots table.
- 325 — A virtual link entry is marked used but match no link is using this entry.
- 326 — A virtual link entry is marked unused but there is a virtual link assigned.
- 327 — The virtual link assignments in the logical-physical tables are inconsistent with the link data.

SEE PROPRIETARY NOTICE ON COVER PAGE

328 — An SLK translates to a link which is equipped but is not a CCS link.

329 — Invalid version numbers on disk files.

e Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d 301, 302, 303, 304

These errors indicate problems in opening/reading the disk files associated with the logical-physical translation tables. These will be corrected in the audit by creating a new disk file and populating it based on the data in the 3B computer. It is suggested that the audit be rerun in order to insure that this condition no longer exists.

If d 305, 306, 312, 323

The data in the 3B computer does not match the data on disk. If the 3B computer is correct, then do a recent change that copies the 3B computer to disk. If however, the disk is correct, do a recent change which updates the tables with the correct data.

If d 307, 308, 309, 310, 311, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 324, 325, 326, 327, 328

These errors are not corrected. User should do recent change to remove the incorrect entry, and another recent change to add the logical to physical and physical to logical data.

If d 329

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

2. REASON FOR OUTPUT

Any errors encountered while auditing the cluster/member routing data will be output so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code.
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 11 — An audit was blocking a needed demand audit.
 - 12 — Audit rejected a request to run from SIM.
 - 13 — SIM aborted audit, audit subsystem was reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

d	Error code: 400 — Unable to open the cluster disk file. 401 — Read error encountered in the cluster disk file. 404 — Small network populated cluster is for nonlocal network only. 405 — The number of static members in a small network is incorrect. 406 — The cluster flag in the 3B computer does not match the cluster flag on disk. 407 — Invalid cluster flag. 408 — Invalid linkset in the cluster or member table(s). 409 — Point code cannot be equal to local point code. 410 — The linkset in the 3B computer cluster table does not match the linkset on disk. 415 — Cannot create disk file. 416 — Inconsistency between the cluster level flag and the unpopulated bit for the nonlocal network. 417 — The cluster is marked as unassigned but routing information exists. 420 — The member flag in the 3B computer table does not match the member flag on disk. 421 — Invalid flag in the member table. 422 — The linkset in the 3B computer member table does not match the linkset on disk. 423 — Unable to open the member disk file. 424 — Read error encountered in the member disk file. 425 — Invalid version number on disk file. 426 — Unable to write cluster disk file. 427 — Unable to append version number to member disk file. 428 — Invalid member flag was found in member disk file.
e	Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d	400, 401, 423, 424	These errors will be corrected during the audit. A new disk file will be created and populated from the table in the 3B computer. Rerunning the audit will verify that the condition no longer exists.
If d	404	These errors are not corrected. User should do recent change to remove the incorrect entry, and another recent change to add the small network populated cluster for the nonlocal network.

SEE PROPRIETARY NOTICE ON COVER PAGE

d 406, 410, 420, 422

The data in the 3B computer does not match the data on disk. If the 3B computer is correct, then do a recent change that copies the 3B computer to disk. If however, the disk is correct, do a recent change which updates the tables with the correct data.

d 405, 407, 421

Invalid data in the cluster/member table can be corrected by doing a recent change which updates the tables with the correct data.

d 408

This error represents a problem with the linkset that appears in either the cluster or member table. The linkset should be changed to a valid linkset.

d 409

This error indicates that the point code is equal to the local point code. To correct this, delete the routing information for this point code with a recent change which updates the tables.

d 415

According to this error message, the audit is having difficulty in creating the new routing data disk file. It is suggested that the audit be re-run and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.

d 416

This error is corrected during the audit by changing the unpopulated bit to match the flag field.

d 417

Delete the routing information with a recent change which updates the tables.

d 425

The version number on the disk does not match the version number the audit expects. The user should check whether the file was retrofitted or whether it is in the proper format.

d 426

According to this error message, the audit is having difficulty in writing the new cluster disk file. It is suggested that the user re-run the audit and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.

SEE PROPRIETARY NOTICE ON COVER PAGE

d 427

According to this error message, the audit is having difficulty in appending the version number to the new member disk file. It is suggested that the user removes the cluster or member disk file and re-run the audit and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.

d 428

According to this error message, the audit found one or more entries in the member disk file which had an invalid flag entry. This was corrected by deleting the entry or entries. The audit should be re-run to confirm the error has been corrected.

SEE PROPRIETARY NOTICE ON COVER PAGE

d

Error code:

- 500 — Unable to open the subsystem distribution disk file.
- 501 — Read error encountered in the subsystem distribution disk file.
- 502 — Unable to open the local subsystem information disk file.
- 503 — Read error encountered in the local subsystem information disk file.
- 504 — The data in the 3B computer does not match the copy on disk.
- 505 — The subsystem should be equipped.
- 506 — Invalid equipped indicator.
- 507 — For an equipped subsystem:
Invalid channel to receive signaling messages.
- 508 — For a subsystem which is equipped by default:
Invalid local function index.
- 509 — For a subsystem which is not equipped by default:
Invalid local function index.
- 510 — For an equipped subsystem:
Invalid want pause indicator.
- 511 — For an equipped subsystem:
Invalid channel to receive management indications.
- 512 — Invalid simplex/ duplex indicator.
- 513 — For an unequipped subsystem:
Invalid address to receive signaling messages.
- 514 — For an unequipped subsystem:
Invalid channel to receive signaling messages.
- 515 — For an unequipped subsystem:
Invalid local function index.
- 516 — For an unequipped subsystem:
Invalid want pause indicator.
- 517 — For an unequipped subsystem:
Invalid simplex/ duplex indicator.
- 518 — For an unequipped subsystem:
Invalid channel to receive management indications.
- 519 — For an unequipped subsystem:
Invalid mate subsystem number.
- 520 — For an unequipped subsystem:
Invalid mate point code.
- 521 — For an unequipped subsystem:
Invalid address to receive management indications.
- 522 — For an equipped subsystem:
Invalid address to receive signaling messages, or invalid address to receive management indications.
- 523 — For an equipped subsystem:
The address to receive signaling messages or the address to receive management indications is an RPC.
- 524 — For an equipped subsystem:
The address to receive signaling messages or the address to receive management indications should be an equipped CCS7 link.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 525 — For a simplex subsystem:
Should have a null mate subsystem number.
- 526 — For a simplex subsystem:
Should have a null mate point code.
- 527 — For a duplex subsystem:
Invalid mate subsystem number.
- 528 — For a duplex subsystem:
Invalid mate point code.
- 529 — For a subsystem which is not equipped by default:
Invalid outgoing local function index.
- 530 — For an unequipped subsystem:
Invalid outgoing local function index.
- 531 — Subsystem Manager has an invalid field.
- 532 — Invalid version numbers on disk files.

e Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d 500, 501, 502, 503

This error is corrected during the audit. A new disk file will be created and populated from the table in the 3B computer. Rerunning the audit will verify that the condition no longer exists.

d 504

Error messages of this type reflect the fact that the data in the 3B computer does not match the data on disk. If the data in the 3B computer is deemed correct, then do a recent change that copies the 3B computer to disk. If the data on disk is correct, then do a subsystem information recent change and modify the appropriate fields.

d 505

Certain subsystems must be equipped by default. The "equipped indicator" does not appear on the RC form, but is handled automatically. This error is corrected by doing a "define subsystem information" recent change, followed by a recent change that copies 3B computer to disk. The "equipped indicator" will be set automatically.

d 506

The "equipped indicator" does not appear on the RC form, but is handled automatically. This error is corrected by doing a "define subsystem information" or "delete subsystem information" recent change, followed by a recent change that copies 3B computer to disk. The "equipped indicator" will automatically be set or cleared appropriately.

SEE PROPRIETARY NOTICE ON COVER PAGE

d 507, 508, 509, 510, 511, 512, 522, 523, 524, 525,
526, 527, 528, 529

These error messages all indicate that there is some invalid data items for an equipped subsystem. These can all be corrected by doing a "define subsystem information" recent change which modifies the appropriate field(s), followed by a recent change that copies 3B computer to disk.

d 513, 514, 515, 516, 517, 518, 519, 520, 521, 530

These error messages all indicate that there is some invalid data items for an unequipped subsystem. These errors are corrected during the audit. The invalid data items are replaced by the proper default data items for an unequipped subsystem. Rerunning the audit will verify that the condition no longer exists.

d 531

This error message indicates that there is an invalid field for the subsystem manager. These errors are corrected during the audit. The invalid fields are replaced by the proper default values for subsystem manager and the table entry is copied from the 3B computer to disk. Rerunning the audit will verify that the condition no longer exists.

d 532

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

2. REASON FOR OUTPUT

Any errors encountered while auditing the permanent relations table will be output so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 11 — An audit was blocking a needed demand audit.
 - 12 — Audit rejected a request to run from SIM.
 - 13 — SIM aborted audit, audit subsystem was reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

d	Error code: 600 — Read error encountered with the permanent relations disk file. 601 — Unable to open the permanent relations disk file. 602 — The other clock node does not appear in the permanent relations table. 603 — The permanent relations table should be empty. 604 — Even home STP missing from the permanent relations table. 605 — Odd home STP missing from the permanent relations table. 606 — Mated point code and subsystem(s) missing from the permanent relations table. 607 — Multiple appearances of a point code in the permanent relations table. 608 — Permanent relations table or disk contain embedded zeros within the table. 609 — Subsystem(s) associated with the point code from disk does not match the subsystem(s) from the 3B computer. 610 — Point code on disk does not match point code in 3B computer. 611 — Subsystem(s) associated with the point code from the 3B computer does not match the subsystem(s) on disk. 612 — Point code in 3B computer does not match point code on disk. 613 — Network identifier of the point code out of range. 614 — Invalid version number on disk file.
e	Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d	600, 601 These errors indicate problems in opening/reading the disk file associated with the permanent relations table. These will be corrected in the audit by creating a new disk file and populating it based on the data in the 3B computer. It is suggested that the audit be rerun in order to insure that this condition no longer exists.
d	602 This error indicates that this office is one of the clock nodes, but a permanent relation has not been established with the other clock node. The audit will automatically add the clock node to the permanent relations table if this situation exists.
d	603 Invalid data was detected in the permanent relations table. The audit automatically clears it by zeroing out the contents. This error is only detected in an STP that is not a clock node.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d 604, 605
- Even/odd home STPs are missing from the permanent relations table. Once detected, the audit automatically adds them to the existing table.
- d 606
- A permanent relation should be established with each mated subsystem. If the relation does not exist, the audit automatically adds it.
- d 607
- The permanent relations table contains multiple occurrences of the same point code. The audit automatically replaces the excess point code(s) with zeros to prevent their duplication.
- d 608
- This error indicates that the permanent relations table and disk copy contain embedded zeros. The audit automatically moves the empty slots to the bottom, thus creating a proper dense list.
- d 609
- The subsystem numbers associated with a point code on disk do not match the subsystem numbers in the 3B computer. If the subsystems that are in the 3B computer are correct, then do an RC to copy 3B computer to disk. If the disk file is correct, then do an RC to add the subsystems to the 3B computer.
- d 610
- The disk point code does not match any of the point codes in the 3B computer. This can be corrected by adding the point code to the 3B computer with an RC, or copying from 3B computer to disk.
- d 611
- The subsystem numbers associated with a point code in the 3B computer do not match the subsystem numbers on disk. If the subsystems that that are in the disk are correct, then do an RC to copy disk to 3B computer. If the 3B computer file is correct, then do an RC to add the subsystems to disk.
- d 612
- The 3B computer point code does not match any of the point codes on disk. Corrections are done by removing the point code from the 3B computer by means of an RC, or with an RC to copy 3B computer to disk.

SEE PROPRIETARY NOTICE ON COVER PAGE

d 613

The 3B computer point code has a network identifier that is out of range. Correction is done by removing the point code and then add in the correct point code by means of the RC, or with the RC to copy 3B computer to disk.

d 614

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

2. REASON FOR OUTPUT

Any errors encountered while auditing the office identification data will be output so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 11 — An audit was blocking a needed demand audit.
 - 12 — Audit rejected a request to run from SIM.
 - 13 — SIM aborted audit, audit subsystem was reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

d	Error code:
	700 — Unable to open the international routing data disk file.
	701 — Read error encountered with the international routing data disk file.
	702 — Unable to create or write the international routing data disk file.
	703 — The 3B computer copy and disk do not match.
	707 — Linkset must consist of all international links.
	712 — The number of equipped point codes in the international routing data table does not match the global actual number of equipped point codes.
	714 — Unable to lseek the international routing data disk file.
	715 — The number of equipped point codes in the international routing data disk file does not match the actual number of equipped point codes.
	716 — The first linkset in the international data disk file is invalid for NOIPC point code.
	717 — The first linkset in the international data disk file is invalid for non NOIPC point code.
	718 — The number of routes in the international routing data structure does not match the actual number of routes.
	719 — The linkset in the international routing data structure is out of range.
	720 — The linkset in the international routing data structure has to be unique.
	721 — The first linkset in the international routing data structure for a valid point code can not be NOSET.
	722 — The linkset of a non-equipped route in the international routing data structure should be NOSET.
	723 — Indexes in Cninf_index and Cnindx_pc tables are not identical for the same point code.
	724 — Index in Cninf_index or Cnindx_pc table is invalid.
e	Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d	700, 701
	According to these error messages, the audit is having difficulty in opening, reading, or creating the international routing data disk file. This will be corrected during the audit by creating a new disk file and populating it with the data in the 3B computer. It is suggested that the audit be rerun to verify that this condition no longer exists.
If d	702
	According to this error message, the audit is having difficulty in creating or writing the new international routing data disk file. It is suggested that the audit be rerun; and if the error message appears

SEE PROPRIETARY NOTICE ON COVER PAGE

again, the user should consult with his system administrator to find out the cause of the error.

If d 703

This error indicates that the data on disk does not match the data in the 3B computer. If the data in the 3B computer is correct, then doing a recent change that copies 3B computer to disk will remedy the problem. If the disk version is correct, then the data in the 3B computer must be changed via an international routing data recent change.

If d 707

This is a discrepancy between the international routing data and the link data. If the link data is in error, then doing link data recent changes on the appropriate links should clear up the problems. If the international routing data is wrong, then a recent change of the international routing data can be done to modify the item(s) in error.

If d 712

This is a discrepancy between the number of equipped international point codes that were found in the international routing table and the actual number of the equipped point codes. This will be corrected during the audit assigning the number of equipped international point codes to the global variable which holds the actual number of equipped point codes.

If d 714

According to this error message, the audit is having difficulty in seeking the desired disk file position before writing the new international routing data disk file. It is suggested that the audit be rerun and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.

If d 715

This is a discrepancy between the number of equipped point codes and the actual number of the equipped point codes in the international routing data disk file. This will be corrected during the audit by assigning the number of equipped point codes to the actual number of equipped point codes.

If d 716

This error indicates that the first linkset for an NOIPC (invalid entry) point code is not NOSET in the international data disk file. The error is corrected during the audit by assigning the first link set to be NOSET for NOIPC point code.

SEE PROPRIETARY NOTICE ON COVER PAGE

If d 717

This error indicates that the first linkset for a non NOIPC (valid entry) point code is NOSET in the international data disk file. If the data in 3B is correct, then doing a recent change that copies 3B to disk will remedy the problem.

If d 718

This is a discrepancy between the number of equipped routes and the actual number of the equipped routes of a point code in the international routing data structure. This will be corrected during the audit by assigning the number of equipped routes to the actual number of equipped routes.

If d 719, 720

This error indicates that the linkset is invalid in the international routing data structure. These can be corrected by doing a recent change of the international routing data and modifying the data item in question.

If d 721

This error indicates that the first linkset for a valid point code is NOSET in the international routing data structure. This can be corrected by doing a recent change of the international routing data structure.

If d 722

This error indicates that the linkset is invalid for a nonequipped route in the international routing data structure. This will be corrected during the audit by assigning NOSET to this linkset in the international routing data structure.

If d 723

This error indicates that the indexes in Cninf_index and Cnindx_pc tables are not identical for the same point code. The user should consult with his system administrator to find out the cause of the error.

If d 724

This error indicates that the index in either Cninf_index or Cnindx_pc table is wrong. This will be corrected during the audit.

1. FORMAT

This message has four output formats:

- [1] AUD ENV=RTR NIDATA 8 COMPLETED
 - a ERRORS FOUND
 - b ERRORS CORRECTED
- [2] AUD ENV=RTR NIDATA 8 STOPPED
- [3] AUD ENV=RTR NIDATA 8 ABORTED CODE c
- [4] AUD ENV=RTR NIDATA 8 ERROR d REPORT
 - DATA 1 X'00000000 DATA 2 X'00000000
 - DATA 3 X'00000000 DATA 4 X'00000000
 - SUPPLEMENTARY DATA FILE
 - e

2. REASON FOR OUTPUT

Any errors encountered while auditing the office identification data will be output so that the appropriate action can be taken to correct the table(s).

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 11 — An audit was blocking a needed demand audit.
 - 12 — Audit rejected a request to run from SIM.
 - 13 — SIM aborted audit, audit subsystem was reinitialized.

SEE PROPRIETARY NOTICE ON COVER PAGE

d	Error code: 800 — Unable to open the global title translator data disk file. 801 — Read error encountered with the global title translator data disk file. 802 — Unable to create or write the global title translator data disk file. 803 — The 3B computer global translator pair and cSadjstp table do not match. 804 — The 3B computer copy and disk do not match. 805 — The global title translator pair is zero. 806 — Invalid network identifier. 807 — Member should be zero for an stp point code. 808 — If an STP, the global translator pair must equal to the point code. 809 — No routing data exists for the point code. 810 — Invalid version number on disk file.
e	Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d	800, 801 According to these error messages, the audit is having difficulty in opening or reading the global title translator data disk file. This will be corrected during the audit by creating a new disk file and populating it with the data in the 3B computer. It is suggested that the audit be rerun to verify that this condition no longer exists.
d	802 According to this error message, the audit is having difficulty in creating or writing the new global title translator data disk file. It is suggested that the audit be rerun and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.
d	803 This error indicates that the data in the 3B computer for the general translator pair does not match the cSadjstp table. The audit will correct the general translator pair recording to the cSadjstp table.
d	804 This error indicates that the data on disk does not match the data in the 3B computer. If the data in the 3B computer is correct, then doing the recent change that copies 3B computer to disk will remedy the problem. If the disk version is correct, then the data in the 3B computer must be changed via a global title translator data recent change.

SEE PROPRIETARY NOTICE ON COVER PAGE

- | | | |
|---|----------|---|
| d | 805 | This error indicates that the general translator pair is zero and different from the cSadjstp table (the cSadjstp point codes are different than zero). The audit will correct the general translator pair according to the cSadjstp table. |
| d | 806, 807 | These errors all indicate that one of the data items in the table is invalid. These can be corrected by doing a recent change of the global title translator data and modifying the data item in question. |
| d | 808 | This error indicates that the general translator pair for an STP office is incorrect. The audit will correct the general translator pair to contain the local point code. |
| d | 809 | This error indicates that no routing data exists for the point code in the table. The user will have to enter routing data by doing a recent change. |
| d | 810 | The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format. |

SEE PROPRIETARY NOTICE ON COVER PAGE

d	Error code: 900 — Unable to open the network identifier routing data disk file. 901 — Read error encountered with the network identifier routing data disk file. 902 — Unable to create or write the network identifier routing data disk file. 903 — The 3B computer data and disk data do not match. 904 — Local NID point code assigned but director information used field is not. 905 — Invalid director index value. 906 — Director index wrong for NID. 907 — Director index does not have a corresponding network identifier. 908 — For nonlocal network cluster/member level routing, the flag and director index are not consistent. 909 — For network level only routing the director index should not be assigned. 910 — Invalid Link set. 911 — For cluster member level routing the prefer field at the NID level should not be assigned. 912 — For local network cluster/member level routing, the flag and director index are not consistent. 913 — Invalid version number on disk file.
e	Text string describing the error encountered.

4. ACTION TO BE TAKEN

If d	900, 901 According to these error messages, the audit is having difficulty in opening, reading the network identifier routing data disk file. This will be corrected during the audit by creating a new disk file and populating it with the data in the 3B computer. It is suggested that the audit be rerun to verify that this condition no longer exists.
d	902 According to this error message, the audit is having difficulty in creating or writing the new network identifier routing data disk file. It is suggested that the audit be rerun and if the error message appears again, the user should consult with his system administrator to find out the cause of the error.
d	903 This error indicates that the data on disk does not match the data in the 3B computer. If the data in the 3B computer is correct, then doing a recent change that copies 3B computer to disk will remedy the problem. If however, the disk version is correct, then the data in the 3B computer must be changed via a network identifier routing data recent change.

SEE PROPRIETARY NOTICE ON COVER PAGE

d 904, 907, 909, 911

These errors are corrected by the audit. Run the audit again and the errors should no longer appear.

d 904, 905, 908, 910, 912

These errors either indicate that there is an inconsistency among flag, index and linkset fields or one of them is out of range. These can be corrected by doing two network identifier routing data recent changes: first, delete the network identifier corresponding to the out-of-range or inconsistent value. Second, add the network identifier back into the database with the correct data.

d 906

This is an inconsistency between the network identifier routing data and the director index data. This can be corrected by doing two network identifier routing data recent changes: First, delete the inconsistent data, this might cause another inconsistency error message (since the director index that was wrongfully used by the network identifier is being deleted and that director index might originally correspond to another network identifier), run the audit again to see if the delete is done properly. If not, delete again. Second, add the correct data. If there are multiple director indexes in the network identifier data assigned to single network identifier in the director index data, the correcting step 1 should be repeated and the audit should be run again until they are all corrected.

d 913

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was retrofitted or whether it is in the proper format.

2. REASON FOR OUTPUT

Any errors encountered while auditing the protocol timers/parameters data will be output so that the appropriate action can be taken to correct the data.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d Error code:
- 1000 — Unable to open the protocol timer / parameter disk file.
 - 1001 — Read error encountered in the protocol timer / parameter disk file.
 - 1002 — Unable to create / write protocol timer / parameter disk file.
 - 1003 — Office timer data in the 3B memory differs from that in the disk file.
 - 1004 — Office timer data in the 3B memory is invalid.
 - 1005 — Link set timer data in the 3B memory differs from that in the disk file.
 - 1006 — Link set timer data in the 3B memory is invalid.
 - 1007 — The link Protocol Timers and Parameters (PTP) data index to the Ring Node Address (RNA) mapping array (Cl7ptp2lk[]) and the RNA to the link PTP data index mapping array (Cl7lk2ptp[]) in the 3B have invalid values.
 - 1008 — The link PTP data is present but the link node data is missing.
 - 1009 — Link timer data in the 3B memory differs from that in the disk file.
 - 1010 — Link timer data in the 3B memory is invalid.
 - 1011 — The link PTP data index to the RNA mapping array (Cl7ptp2lk[]) in the disk has an invalid RNA value.
 - 1012 — The RNA to link PTP data index mapping array (Cl7lk2ptp[]) is inconsistent with the link PTP data to RNA mapping array (Cl7ptp2lk[]).
 - 1013 — Invalid version number in the disk file.
 - 1014 — Too many bytes in the protocol timer / parameter disk file.
 - 1015 — The link PTP data index to the RNA mapping array (Cl7ptp2lk[]) mismatch between the 3B memory and the disk.
- e Text string describing the error encountered.

4. ACTION TO BE TAKEN

If variable d = 1000, 1001

These errors are corrected during the audit. A new disk file will be created and populated from the data in the 3B computer. Rerunning the audit will verify that the condition no longer exists.

If variable d = 1002

This error indicates that the operating system prevented the audit from creating / writing a new disk file. The reason should be determined and corrected before rerunning the audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

If variable d = 1003

Error messages of this type reflect the fact that the office timer data in the 3B computer does not match the data on the disk. If the data in the 3B computer is deemed correct, then do an office timer recent change that copies the 3B memory office timers to disk. If the data on disk is correct, then do an office timer recent change for 3B memory and modify the appropriate timers.

If variable d = 1004

These error messages indicate that there are invalid office timer data items in 3B memory. These can be corrected by doing an office timer recent change for 3B memory. Consider following this with an office timer recent change that copies the 3B memory office timers to disk.

If variable d = 1005

Error messages of this type reflect the fact that the link set timer data in the 3B computer does not match the data on the disk. If the data in the 3B computer is deemed correct, then do a link set timer recent change that copies the 3B memory link set timers to disk. If the data on disk is correct, then do a link set timer recent change for 3B memory and modify the appropriate timers.

If variable d = 1006

These error messages indicate that there are invalid link set timer data items in 3B memory. These can be corrected by doing a link set timer recent change for 3B memory. Consider following this with a link set timer recent change that copies the 3B memory link set timers to disk.

If variable d = 1007

The Cl7ptp2lk[] is an array mapping the slot containing the link PTP data to RNA. The Cl7lk2ptp[] is an array mapping the RNA to the slot containing the link PTP data. This error reflects that the 3B memory of either of these arrays has an invalid value. The audit corrects this problem by resetting the value to 0. Re-running the audit will verify that the condition no longer exists.

If variable d = 1008

The audit corrects these errors by deleting the link PTP data. Re-running the audit will verify that the condition no longer exists.

If variable d = 1009

Error messages of this type reflect the fact that the link timer data in the 3B computer does not match the data on the disk. If the data in the 3B computer is deemed correct, then do a link parameter (not link node data) recent change that copies the 3B memory link parameters to disk. If the data on disk is correct, then do a link parameter (not link node data) recent change for 3B memory and modify the appropriate timers.

If variable d = 1010

These error messages indicate that there are invalid link timer data items in 3B memory. These can be corrected by doing a link parameter (not link node data) recent change for 3B memory. Consider following this with a link parameter recent change that copies the 3B memory link parameters to disk.

SEE PROPRIETARY NOTICE ON COVER PAGE

If variable d = 1011

The Cl7ptp2lk[] is an array mapping the slot containing the link PTP data to RNA. This error reflects that the disk copy of this array has an invalid RNA value. These errors can be corrected by doing a link PTP disk update that copies the 3B memory link PTP data to disk.

If variable d = 1012

The Cl7ptp2lk[] is an array mapping the slot containing the link PTP data to RNA. The Cl7lk2ptp[] is an array mapping the RNA to the slot containing the link PTP data. These error messages indicate that the 3B memory of these two arrays are inconsistent. The audit corrects these problems by making the values of the Cl7lk2ptp[] array consistent with the values of the Cl7ptp2lk[] array because Cl7lk2ptp[] is derived from Cl7ptp2lk. Re-running the audit will verify that the condition no longer exists.

If variable d = 1013

The version number on the disk does not match the version number the audit expects. The user should check whether the disk file was created or retrofitted, and whether it is in the proper format.

If variable d = 1014

This error is corrected during the audit. A new disk file will be created and populated from the data in the 3B computer. Re-running the audit will verify that the condition no longer exists.

If variable d = 1015

The Cl7ptp2lk[] is an array mapping the slot containing the link PTP data to RNA. Error messages of this type reflect the fact that the 3B memory and disk values of this array do not match. These errors can be corrected by doing a link PTP disk update that copies the 3B memory link PTP data to disk.

WARNING
CNI Customer Support should always be notified in the event of an
error. CNI does not recommend running this audit in error correction
mode. Error correction mode should only be used under the guidance of
CNI Customer Support.

When the audit is run in error correction mode, the applications are
NOT notified of the updates to the 3B20D/3B21D routing data.

1. FORMAT

[1] AUD ENV=RTR NMDATA 1 COMPLETED
a ERRORS FOUND
b ERRORS CORRECTED

[2] AUD ENV=RTR NMDATA 1 STOPPED

[3] AUD ENV=RTR NMDATA 1 ABORTED CODE c

[4] AUD ENV=RTR NMDATA 1 ERROR [d]e f REPORT COMPLETED
DATA1 X'gggggggg DATA2 X'hhhhhhh
DATA3 X'iiiiiii DATA4 X'jjjjjjjj

NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

This output is the result of executing the NMDATA 1 audit.

Format 1 prints when the NMDATA 1 audit runs to completion (with or without errors).
Contains the summary report.

Format 2 prints in response to the STOP:AUD (with NMDATA-1 option) input command.

Format 3 prints in response to a problem that the System Integrity Monitor (SIM)
encountered with the audit.

Format 4 prints when errors are detected by the NMDATA 1 audit. Reports the errors.

3. VARIABLE FIELD DEFINITIONS

a Total number of errors found.
b Total number of errors corrected.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Abort code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
- d Table that the error occurred in:
- 10 — Network table.
 - 11 — Cluster table.
 - 12 — Page Access table.
 - 13 — Member table.
 - 14 — Free List Header table.
 - 15 — Link Set Translation table.
 - 16 — Routing Priority Index (RPI) status table.
 - 18 — Director index to network table.
 - 19 — Page Access count.
- NOTE:** If the error code is 13 or 14, then the table the error occurred in will not be present in the output.
- e Error code:
- 00 — Invalid free list header.
 - 01 — Infinite free list (loop in free list).
 - 02 — Multiple pointers point to the next table entry.
 - 03 — No pointer exists.
 - 04 — Index error.
 - 05 — Invalid flag value.
 - 06 — Invalid/inconsistent route status.
 - 07 — Error in count of exceptional page access data.
 - 08 — An unused data field has an invalid value.
 - 09 — An entry in the director index to network table is inconsistent with data in the network table.
 - 10 — The link set translation table is inconsistent with the link set relation or routing priority tables.
 - 11 — The RPI status table is inconsistent with the link set status table.
 - 12 — SCCP index field inconsistency.
 - 13 — Maximum errors threshold reached.
 - 14 — Invalid internal audit data.
- NOTE:** Errors 00 through 13 are associated with different tables. Errors 13 and 14 are not associated with any tables and therefore the table that the error occurred in variable will not be printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

f	Indicates whether the error was corrected or not: CORR NOT CORR
g	Address of the error.
h	Erroneous data value.
i	Index into the table (see table that the error occurred variable to determine which table).
j	Correct data value.

4. ACTION TO BE TAKEN

Run the AUD:NIDATA-4 input command for more information.

[4] AUD ENV=RTR NMDATA 2 ERROR d e REPORT COMPLETED
DATA1 X'ffffffff DATA2 X'ggggggggg
DATA3 X'hhhhhhh DATA4 X'iiiiiii

NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

This output is the result of executing the NMDATA 2 audit.

Format 1 Prints when the NMDATA 2 audit runs to completion (with or without errors).
Contains the summary report.

Format 2 Prints in response to the STOP:AUD (with NMDATA-2 option) input command.

Format 3 Prints in response to a problem that the System Integrity Monitor (SIM)
encountered with the audit.

Format 4 Prints when errors are detected by the NMDATA 2 audit. Reports the errors.

3. VARIABLE FIELD DEFINITIONS

a Total number of errors found.

b Total number of errors corrected.

c Abort code:

- 3 — Audit was aborted without completing its work.
- 4 — Audit was faulted while correcting errors.
- 5 — SIM could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.

- d Error code:
- 15 — Invalid internal audit data.
 - 20 — Bad Ring Node Address (RNA) value in loadshare table.
 - 21 — RNA in loadshare table is inconsistent with link node data.
 - 22 — RNA found in loadshare table but should not be in the table.
 - 23 — RNA was not found in loadshare table, but should be.
 - 24 — Link state for RNA indicates that the linkset status should be NORMAL.
- e Indicates whether the error was corrected or not:
- CORR
- NOT CORR.

If d = 20, 21, or 22

- f The address of the error in the loadshare table.
- g The erroneous data value. For error 16, DATA2 contains the value of the RNA which has the inconsistency with the link node data. For error 17, DATA2 contains the value of the RNA which is in the table, but should not be.
- h The linkset number which is used to access the specific loadshare table.
- i The correct data value from a newly-created copy of the loadshare table. The correct data value from the copy of the loadshare table is associated with the same Signaling Link Selection (SLS) code as the incorrect data value.

If d = 23 or 24

- f The address of the RNA in the linkset-to-RNA table.
- g The erroneous data value. For error 18, DATA2 contains the value of the RNA which is not in the table but should be. For error 19, DATA2 contains the value of the RNA for which the link state indicates the linkset status should be NORMAL.
- h The linkset number used to access the specific loadshare table.
- i 0 for these errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

CNI Customer Support should be notified in the event of an error. This audit is normally run in error correcting mode. Any changes in the 3B20D/3B21D data are also reflected in Direct Link Nodes (DLNs) and D-Channel (DCHN) nodes. The applications are notified of loadshare table updates when this audit is run in error correction mode.

ID AUD:NMDATA-3
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,CNI
TYPE Output

CAUTION
CNI Customer Support should always be notified in the event of an
error. CNI does not recommend running this audit in error correction
mode. Error correction mode should only be used under the guidance of
CNI Customer Support.

1. FORMAT

[1] AUD ENV=RTR NMDATA 3 COMPLETED
a ERRORS FOUND
b ERRORS CORRECTED

[2] AUD ENV=RTR NMDATA 3 STOPPED

[3] AUD ENV=RTR NMDATA 3 ABORTED CODE c

[4] AUD ENV=RTR NMDATA 3 ERROR de f REPORT COMPLETED
DATA1 X'gggggggg DATA2 X'gggggggg
DATA3 X'gggggggg DATA4 X'gggggggg

NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

This output is the result of executing the NMDATA 3 audit.

Format 1 Prints when the NMDATA 3 audit runs to completion (with or without errors).
Contains the summary report.

Format 2 Prints in response to the STOP:AUD (with NMDATA 3 option) input command.

Format 3 Prints in response to a problem that the System Integrity Monitor (SIM)
encountered with the audit.

Format 4 Prints when errors are detected by the NMDATA 3 audit. Reports the errors.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — SIM could not start or dispatch the audit.
- 6 — An error was encountered in the audit control/audit library interface.
- 7 — Audit exceeded its timeout or segment limit.
- 8 — SIM aborted an executing routine audit because of a blocking request.
- 9 — Transient process that was running the process terminated.
- 10 — A segmented audit exceeded an error threshold.

d

Table that the error occurred in:

- 0 — Network table.
- 1 — Cluster table.
- 2 — Page access table.
- 3 — Member table.
- 4 — Free list header table.
- 5 — Page access count.
- 6 — Subsystem count.
- 7 — Route set test table.
- 8 — Cluster route set test table.

e

Error code:

- 30 — Incorrect route set test count value.
- 31 — Invalid point code in the route set test table.
- 32 — Invalid cluster in the cluster route set test table.
- 33 — Point code without TFR or TFP route is in the route set test table.
- 34 — Cluster without TFR or TFP route is in the cluster route set test table.
- 35 — Point code with nonlocal network is in the local route set test table.
- 36 — Cluster with nonlocal network is in the local cluster route set test table.
- 37 — Point code with local network is in the nonlocal route set test table.
- 38 — Cluster with local network is in the nonlocal cluster route set test table.
- 39 — Point code twice in the route set test table.
- 40 — Cluster twice in the cluster route set test table.
- 41 — Point code should be put in the route set test table.
- 42 — Cluster should be put in the cluster route set test table.
- 43 — Rst_running bit in routing table incorrect.

f

Indicates whether the error was corrected or not:

CORR

NOT CORR

SEE PROPRIETARY NOTICE ON COVER PAGE

DATA1	The address of the error.
DATA2	The erroneous data value.
DATA3	The index into the table (see variable field d to determine which table).
DATA4	The correct data value.
ggggggggg	Hexadecimal data field information.

4. ACTION TO BE TAKEN

None.

ID AUD:NODEST
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,IMS
TYPE Output

1. FORMAT

- [1] AUD ENV=RTR NODEST a COMPLETED
b ERRORS FOUND
c ERRORS CORRECTED
- [2] AUD ENV=RTR NODEST a STOPPED
- [3] AUD ENV=RTR NODEST a ABORTED CODE d
- [4] AUD ENV=RTR NODEST a ERROR e REPORT
DATA1 X'f DATA2 X'g
DATA3 X'h DATA4 X'i

NO SUPPLEMENTARY DATA

2. REASON FOR OUTPUT

To report the termination status of the ring Node State (NODEST) audits and/or any errors found.

These audits may be executed due to:

- Routine schedule.
- Manual request.
- IMS initialization (level 0 or 1B).

When the audit finds no errors, termination status is printed only for manual requests.

3. VARIABLE FIELD DEFINITIONS

- a Specifies a particular member of the NODEST family of audits.
1 — The node availability map audit. (See the AUD:NODEST input message for a description.)
- b Total number of errors found.
- c Total number of errors corrected.
- d Abort Code:
3 — Audit was aborted without completing its work.
4 — Audit was faulted while correcting errors.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the audit terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 12 — Audit rejected the request to run.
 - 13 — SIM aborted executing audit because audit subsystem is being reinitialized.
- e Error code. For a = 1 the error code is always 0.
- f For a = 1, the bit position in the node availability map (0-X'3FF). When this is expressed as three hexadecimal digits, the left two digits identify the ring node group and the right digit identifies the ring node position in the group. Thus X'3FF corresponds to ring node group 63, position 15.
- g For a = 1, the expected value of the map bit corresponding to the ring node f.
- 0 — Ring node is an RPCN or is an IUN which is not in the ACT major state.
 - 1 — Ring node is an IUN in the ACT major state.
- h For a = 1, the major state of ring node f, as recorded within the IMS driver process. (For more detail see the OP-RING output message.)
- 0 — ACT
 - 1 — STBY
 - 2 — UNAV
 - 3 — OFL
 - 4 — OOS
 - 5 — UNEQIP
 - 6 — INIT
 - 7 — GROW
- i For a = 1, should always be 0.

4. ACTION TO BE TAKEN

Format 1 should appear alone only when the audit is manually requested with the summary option or detected no errors. Error analysis must be based on Format 4 messages.

Format 2 is printed when an execution of the audit is stopped via the STOP:AUD input message or by an initialization of the IMS subsystem.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 should occur only during outages and initializations of the IMS subsystem. If it occurs when IMS is operational, seek technical assistance.

Format 4 reports errors detected by the audit. Seek technical assistance to determine the cause of the trouble.

For a = 1 (The node availability map audit), all of the errors indicate mutilated internal data or other software problems. These errors can occur as a side effect of other problems, such as those reported via the REPT-IMSDRV-FLT output message.

Correction should be made by the audit. If error correction was indicated (c > 0) then the audit corrected the errors.

To verify that error correction was successful, run the audit again via the AUD:NODEST (with option 1) input message.

2. REASON FOR OUTPUT

Format 1 indicates the input message completed, how many errors were found, and how many were corrected.

Format 2 indicates the audit stopped.

Format 3 indicates the audit aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 4, 5, and 6 indicate that an error has been found in the audit of the Plant Measurements System (PMS).

Format 7 indicates that the audit can not be started at this time.

Format 8 indicates the inhibit status of the PMS audit.

3. VARIABLE FIELD DEFINITIONS

- a Audit member number:
- 1 — Manual, routine, or demand audit.
 - 2 — Create the database.
- b Total number of errors found.
- c Total number of errors corrected.
- d Abort code:
- 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — SIM could not start or dispatch the audit.
 - 6 — An error was encountered in the audit control/audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.
 - 9 — Transient process that was running the process terminated.
 - 10 — A segmented audit exceeded an error threshold.
 - 12 — Audit rejected the request to run from SIM.
 - 13 — SIM aborted an executing audit because the audit system is being reinitialized.
- e Error code (0-5034). See CIC Select Code 304-046 *System Maintenance Manual*, Plant Measurements System (PMS) Audits chapter, for error codes 0-3, 1000, 1001, or 2000-5034. See LLA Output Appendix, APP:LLA, for error codes 100-1301.
- f Supplementary data block number.
- g An explanation of the error identified by the error code. If the error code is 0-3, 1000, 1001, or 2000-5034, refer to the following list. If the error code is 100-1301, see LLA Output Appendix, APP:LLA.

j	Explanation of error - see Output Audit Appendix B, APP:AUD-B.
k	Inhibit status: ALLOWED — Audit has been automatically allowed by SIM. INHIBITED — Audit has been automatically inhibited by SIM.

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

Format 1 indicates success. Take no action.

Format 2 is an informational message that the audit has stopped. Take no action.

Format 3 indicates that the audit aborted. The action to be taken varies from retrying the audit to seeking technical advice, depending on the abort code.

Formats 4, 5, and 6 indicate that an error has been found in the audit of the PMS. Look up the error code as described in the variable field description section. Action to be taken varies depending on the error code.

Format 7 indicates that the audit can not be started at this time. Action to be taken varies from retrying the audit to seeking technical advice, depending on the reason for failure. See the Output Audit Appendix C, APP:AUD-C, and Output Audit Appendix D, APP:AUD-D.

Format 8 indicates the inhibit status of the PMS audit. Take no action.

- [6] AUD ENV=RTR PROAD 1 AUTOMATICALLY l

2. REASON FOR OUTPUT

To report the termination status of the process administration audit and/or any errors found while executing the audit.

3. VARIABLE FIELD DEFINITIONS

- a Total number of errors found.
- b Total number of errors corrected.
- c Abort code:
 - 3 — Audit was aborted without completing its work.
 - 4 — Audit was faulted while correcting errors.
 - 5 — System Integrity Monitor (SIM) could not start or dispatch the audit.
 - 6 — An error was encountered between the audit control and audit library interface.
 - 7 — Audit exceeded its timeout or segment limit.
 - 8 — SIM aborted an executing routine audit because of a blocking request.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 12 — Audit rejected the request to run from SIM.
- 13 — SIM aborted an executing audit because the audit system is being reinitialized.

d Error code. Values 100-399 represent errors that occur during process termination. In particular, values 100-199 occur in the scheduler, 200-299 in the capability manager, and 300-399 in the process manager. Values 500-799 represent errors that occur during process creation. In particular, values 500-599 represent errors during pcreat of kernel processes, 600-699 represent errors during pcreat of supervisor processes, and 700-799 represent errors during process fork. Value 800 indicates that the process has been suspended from execution for over 30 minutes.

A problem occurred during or after:

- 100 — The use count was decremented.
- 110 — term_dct was called.
- 120 — GRASP or DART was informed.
- 130 — The DCTE was unlinked from its dispatch chain.
- 140 — The Address Translation Buffers (ATBs) were flushed.
- 150 — The acknowledgement message was allocated and copied.
- 160 — The Dispatch Control Table Entry (DCTE) was unlinked from the ready or not-ready list.
- 170 — The incarnation count was bumped.
- 180 — The message has (or should have) gone to the capability manager.
- 190 — The message has (or should have) gone to the process manager.
- 200 — The capabilities were removed.
- 210 — The segments were removed (supervisor).
- 220 — The segments were removed (kernel process).
- 300 — The core dump has started.
- 310 — The message was sent to the capability manager.
- 500 — pcreat has started (kp).
- 510 — DCTE was linked.
- 520 — Initialization event sent.
- 600 — pcreat has started (sp).
- 610 — DCTE was linked.
- 620 — The pstart has completed.
- 630 — Execute started.
- 700 — fork started (pfork1).
- 710 — DUPCAPS message sent to the file manager.
- 720 — pfork2 started.
- 730 — Sending the wake up event to the child.
- 800 — Process has been suspended from execution.

e Process's utility ID.

f The amount of time, in milliseconds, that the process has been stuck.

SEE PROPRIETARY NOTICE ON COVER PAGE

- g Process number.
- h Correction completion code:
- 00000000 — The error was corrected, or the audit was run in non-correcting mode.
 - 00000010 — The DCT pointer failed fault retry validation when trying to send a DUPCAPS message.
 - 00000020 — The DCT extender pointer failed fault retry validation when trying to send a DUPCAPS message.
 - 00000030 — The PCB segid in the process's DCT entry was found to be invalid when trying to send a DUPCAPS message.
 - 00000040 — The audit could not attach to the process's PCB when trying to send a DUPCAPS message.
 - 00000050 — The audit could not allocate a DUPCAPS message.
 - 00000060 — The audit could not queue a DUPCAPS message.
 - 00000070 — The DCT pointer failed fault retry validation when trying to send a terminate message.
 - 00000080 — The DCT extender pointer failed fault retry validation when trying to send a terminate message.
 - 00000090 — The audit could not allocate a terminate message to kill a suspended process.
 - 000000a0 — The audit could not queue a terminate message to kill a suspended process.
 - 000000b0 — The PCB segid in the process's DCT entry was found to be invalid when trying to fake a pcreat acknowledgement message.
 - 000000c0 — The audit could not attach to the process's PCB when trying to fake a pcreat acknowledgement message.
 - 000000d0 — The audit could not allocate a pcreat message to fake a pcreat acknowledgment message.
 - 000000e0 — The audit could not queue a pcreat message to fake a pcreat acknowledgment message.
 - 000000f0 — The audit could not allocate a terminate message to kill a process.
 - 00000100 — The audit could not queue a terminate message to kill a process.
- i For explanation of error, see the Output Audit Appendix C, APP:AUD-C.
- j For explanation of error, see the Output Audit Appendix D, APP:AUD-D.
- k Explanation of error - see Audit Appendix B, APP:AUD-B.
- l Inhibit status:
- ALLOWED — Audit has been automatically allowed by SIM.
 - INHIBITED — Audit has been automatically inhibited by SIM.

SEE PROPRIETARY NOTICE ON COVER PAGE

NOTE: See Output Audit Appendix A, APP:AUD-A and Output Audit Appendix B, APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

4. ACTION TO BE TAKEN

If the audit is run in non-correcting mode and failures occur, rerun the audit in correcting mode.

ID AUD:REMACS
WORK CENTER.. MOC
GENERIC 4AP14 and later
APPLICATION .. 4E,CNI
TYPE Output

1. FORMAT

RING AUD ENV=RTR REMACS
explanatory string(s)

2. REASON FOR OUTPUT

Prints in response to AUD:REMACS input request.

3. VARIABLE FIELD DEFINITIONS

The explanatory string(s) will describe the result of the AUD:REMACS input message. It will indicate whether or not the input command was executed as requested and the reason for failure if required.

In addition the STATUS option will display the following:

AUDIT IS xxxxxxxxx
CURRENT CYCLE COUNT IS y
FREQ IS ONCE PER z REMACS INVOCATIONS(S)

Where:

xxxxxxx	ALLOWED
	INHIBITED
	INHIBITED AND CYCLING
	RUNNING ON DEMAND
y	Current cycle count if the audit is cycling
z	Current frequency of invocation.

The WINDOW "W" option will cause the following display message:

DEMAND AUDIT V

Where V is one of the following and "W" is the window name specified in the AUD:REMACS:WINDOW "W" command:

ON WINDOW "W" STARTED
ON WINDOW "W" COMPLETED
ON WINDOW "W" IS INVALID
NOT ALLOWED

SEE PROPRIETARY NOTICE ON COVER PAGE

The NOT ALLOWED message indicates that either the REMACS audits are not inhibited or that the demand audit is already running. To determine which condition applies, use the AUD:REMACS:STATUS command.

The ON WINDOW "W" IS INVALID indicates that "W" specifies an undefined REMACS window.

4. ACTION TO BE TAKEN

None.

5. REFERENCES

Input Message
AUD:REMACS

SEE PROPRIETARY NOTICE ON COVER PAGE

ID AUD:TDAS
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

- [1] AUD ENV=RTR TDAS - NO PASSWORD FILE
- [2] AUD ENV=RTR TDAS REPORTS
TDAS PARTITION ERROR REPORT
a b - c
TDAS AUDIT DISK MANAGEMENT REPORT
FREE BLOCKS LEFT ON PARTITION - d
NUMBER OF GOOD e FILES - f

2. REASON FOR OUTPUT

To print the traffic data administration system (TDAS) audit report which is scheduled to run once a week. If the process which formats data for the TDAS data base detects certain types of errors implying a bad file structure within TDAS, the audit will be run. If this output comes out at a time different than is listed in crontab, another TDAS error has taken place to cause the audit to be run.

All TDAS related messages are recorded in the log file TDASLOG and may be accessed using OP:LOG;TDASLOG.

3. VARIABLE FIELD DEFINITIONS

- a The pathname in the TDAS partition that caused the error.
- b The action that the audit performed. Actions depend on the cause of the error. Actions are:
- REMOVED —The file has been removed from the system.
- RECREATED —The file was recreated and now exists.
- NOACTION —The file should exist and will be recreated by other means.
- UNABLE TO RECREATE — Unable to recreate at this time and will try again next time audit is called.
- c The cause of the error. Causes are:
- CORRUPT STRUCTURE — Internal TDAS format no good.
- AGED — Data file over 7 days old will be removed.
- BAD PATHNAME — Illegal file in TDAS system.
- BAD MAGIC NUMBER — Bad magic number in file.

SEE PROPRIETARY NOTICE ON COVER PAGE

WAS NON-EXISTENT — Required file non-existent.

- d The number of free blocks left in the TDAS partition for new data. In a running office, this number will be near zero and new data will replace old data.
- e Type of data. "mc1" refers to measurement class 1 data, "ftsg" refers to fixed trunk subgroup data, "vtsg" refers to variable subgroup data, and "icdr" refers to international call record data.
- f Number of good data files for a specific measurement class (MC). Each file corresponds with one hour of data. Only MCs with at least one good data file will be listed.

Note: Also given is the number of hours of data in each MC removed due to the aging function of the audit. The audit removes any file over one week old. Given that the audit runs once a week, the oldest file in the TDAS data base will be 13 days old.

4. ACTION TO BE TAKEN

If the audit runs at a time different than listed in crontab, investigate the initial TDAS error.

For format 1, no data link access is possible to the TDAS data without a password file. The password file will be created automatically when the first ID and password are entered into the system using the IN:TDAS input message.

TYPE Output

1. FORMAT

- [1] CFR DUPLEXDISKS STOPPED WITH ERROR a
- [2] CFR DUPLEXDISKS COMPLETED

2. REASON FOR OUTPUT

To report the result of executing the CFR:DUPLEXDISKS command.

3. VARIABLE FIELD DEFINITIONS

a Type of error found:

X'C000 — ABD is not active.

The system is not booted with an Alternate Boot Disk (ABD) selected. Moving Head Disk (MHD) 0 and MHD 1 are the current duplexed boot disk pair.

X'C001 — Failed to get Unit Control Block (UCB) for the current duplexed boot disk pair.

An internal error occurred trying to read the in-core Equipment Configuration Database (ECD). Additional information is provided by Process Recovery Message (PRMs) generated by Error Interrupt Handler (EIH).

X'C002 — An invalid state was detected.

If MHD 0 is one of the current duplexed boot disks, it's state must be Active (ACT). MHD 1 and the Alternate Boot Disk must not be in the ACT, Standby (STBY), or Initialization (INIT) states.

If MHD 1 is one of the current duplexed boot disks, it's state must be ACT. MHD 0 and the Alternate Boot Disk must not be in the ACT, STBY, or INIT states.

X'C003 — A failure occurred trying to configure the duplex boot disk pair to the system default.

An internal error occurred trying to configure the duplex boot disk pair to MHD 0 and MHD 1. Additional information is provided by PRMs generated by EIH.

SEE PROPRIETARY NOTICE ON COVER PAGE

X'C004 — Disk Driver not notified of change.

The 120 Status Page will not show the correct disk status.

X'C005 — RTS not notified of change.

The 102 Status Page will not show the correct disk configuration.

X'C006 — This command is only supported on the 3B21D Hardware Platform.

X'C007 — At least one of MHD 0, MHD 1, or the ABD is reserved by another process.

4. ACTION TO BE TAKEN

If Format 1 is printed, resolve the error condition described above. Seek technical assistance if necessary to resolve the error condition.

Format 2 indicates that the command completed execution successfully. If this format is printed, no action is necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID CHG:SLK
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,CNI
TYPE Output

1. FORMAT

CHG SLK a b [c d]
= CHG SLK a b [c d] e, f [,g][,h][= i][= j]

2. REASON FOR OUTPUT

Response to a request to change the Minor state of a Signaling Link (SLK). Circuit pack and port numbers may be included to identify an SLK on a multi-link node.

The new minor state value is the "externally visible" minor state that existed when the initial state change processing completed. Total processing to change minor states begins with this initial state change processing, which initiates a concurrent sequence of protocol actions and associated additional processing that usually complete very quickly, and usually are completed by the time initial state change processing ends. In this case the minor state value is the final minor state requested in the CHG:SLK input message. But the initiated sequence of protocol actions may complete with some delay, or be obstructed and not complete at all, in which case the minor state value is an intermediate minor state or even the minor state that existed when the CHG:SLK message was entered.

For an example that involves protocol action delays, the input command CHG:SLK() ;ARST requests the change from the Manual Out Of Service (MOOS) state to the In Service (IS) state. This command actually sequences the link through the MOOS, Out Of Service OOS), and IS states. If link protocol actions are delayed or obstructed, the link may be reported as being OOS instead of IS when the CHANGE ACCEPTED, NEW MINOR STATE = j message is printed.

Also, to keep the number of transactions and output messages associated with the minor state change of a mated D-Channel link reasonably few in number, some internal, transitional states that normally last only a fractional part of a second are not given external visibility. However, when link protocol actions are delayed or obstructed, state change processing can stay in these internal, transitional states much longer, i.e. tens of seconds or even minutes. In these cases, the minor state that continues to be displayed externally is the last minor state that the link was in that is given external visibility, i.e. that is not a "hidden" minor state. For example, the command CHG:SLK(a, b, e, f) ; IS when used to change a Standby mated D-Channel link to the in-service minor state, causes the link to sequence from Standby to wait (an internal, hidden state) to IS. While in the internal wait state, Standby (STBY) continues to be displayed externally. If link protocol actions are delayed or obstructed, then, while the link is in the internal wait state, STBY will continue to be displayed externally until the link actually enters the IS state or the OOS state (both of these minor states are externally visible).

When the CHANGE ACCEPTED message is printed, the value for the minor state value is the externally visible minor state value that actually existed when initial state change

SEE PROPRIETARY NOTICE ON COVER PAGE

processing ended. If, in the rare occurrence of protocol delay or obstruction, the minor state value is not the final minor state being requested, then per-link displays (if available) should be monitored for progress toward the final requested minor state, or the OP:SLK input message should be used to check for progress toward that requested state. The OP:SLK input message with the RAW option can be used to display the numerical values of some internal states. For example, with the RAW option, the internal level 3 control state for mated D-Channels can be examined to check if the mated link is stuck in one of the normally transient, hidden wait or MB states.

	IS — Available in service.
	MOOS — Available manual out-of-service.
	OOS — Available out-of-service.
	STBY — Available standby.
	TEST — Unavailable test.

4. ACTION TO BE TAKEN

If a change request is denied, the output message will indicate what kind of a problem was encountered.

A common reason for denied change requests is incompatibility between the request and the current minor state of the link. The current minor state of the link is printed in the output message in some cases, or it can be determined via the `OP:SLK` command or other status displays. The `CHG:SLK` input message should be used to determine the valid change requests for a given link minor state.

If a change request is denied with the message `CHANNEL IN USE`, `RETRY LATER`, the most likely reason is that a previously issued `CHG:SLK` command is currently executing. Only one `CHG:SLK` request can be in-progress at any one time. The `CHG:SLK` command also competes with the `LKC:SLK` command for a communications channel. Thus, only one `CHG:SLK` or `LKC:SLK` command can be in-progress at any one time.

If c = SLK a b CHANGE DENIED, FAR END REFUSED MCO REQUEST

The far end has refused the MCO (Manual Change Over) request, and there is no data at the near end to indicate why the MOOS (Manual out-of-service) was denied. To determine the reason for refusal, a MOOS can be requested from the far end and the reason for refusal will be output there.

f1e — message reception failure
f21 — process timed out
f24 — failed to close special device file
f27 — failed to release special device file
f2a — failed to unreserve UCB of unit
f2d — failed to close ECD
f30 — terminated externally with signal

c System error code number. See System Error Codes Output Appendix, APP:SYSERR.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable, to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Format 6 indicates that the command was aborted either because the process timed out or because the disk driver could not clear the Media Access Error Counter (MAEC) for the specified MHD. In either case, the input request should be retried. If the error condition continues, seek technical assistance from the next level of support.

A termination report specifying completion indicates that all directives of the input request were done, and no failures were encountered.

1. FORMAT

- [1] CLR PTN CLEARING a ON MHD b
- [2] CLR PTN ON MHD b COMPLETED
- [3] CLR PTN STOPPED WITH ERROR CODE {c|d} ERRNO e[, (f)]

2. REASON FOR OUTPUT

To report the result of executing a CLR:PTN input message, and to provide status information.

3. VARIABLE FIELD DEFINITIONS

- a Path name of partition being initialized with zeroes.
- b Specifies disk unit containing backup disk copy with application partitions cleared.
- c Error code indicating error that caused process to terminate. The first three digits indicate the nature of the error. The last two digits (represented as xx) indicate which module the error occurred in.
 - 101xx — Missing arguments.
 - 102xx — Destination disk does not exist.
 - 103xx — Destination disk is not active.
 - 104xx — Mate of destination disk does not exist.
 - 105xx — Mate of destination disk is not active.
 - 106xx — Specification file (see e) does not exist.
 - 107xx — Duplicate partitions in specification file.
 - 108xx — File name (see e) in specification file is not a partition.
 - 109xx — File name (see e) in specification file does not exist.
 - 110xx — Partition specified (see e) does not exist in destination disk.
 - 111xx — File name (see e) in specification file does not have any entry in the Volume Table Of Contents (VTOC) (it may be a block device but not a partition).
 - 112xx — Specification file (see e) is empty.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 113xx — Process was stopped by a Signal Termination (SIGTERM).
- 114xx — Partition (see e) is not an application partition. This partition needs to be set with correct flag in the VTOC.
- d Errors associated with system calls. The first three digits indicate the nature of the error. The last two digits (represented as xx) indicate which module the error occurred in.
- 201xx — The open() failed to open e.
- 202xx — mknod() failed to create special device file e (temporary file to read VTOC from disk).
- 203xx — read() failed to read file e.
- 204xx — mkseg() failed to allocate one segment of memory.
- 205xx — lseek() failed to change offset (see e) in out of service disk.
- 206xx — setio() failed to set physical IO for e.
- 207xx — write() failed on segment e (on partition being cleared).
- 208xx — ugucbn() failed to get Unit Control Block (UCB) information for Moving Head Disk (MHD) e.
- 209xx — ugucb() failed to get UCB information for MHD e.
- 210xx — unlink() failed to unlink file e.
- 211xx — ursvucb() failed to reserve MHD e.
- 212xx — ugsdf() failed to access Out Of Service (OOS) disk MHD e.
- 213xx — sendpw() failed to send message to e.
- 214xx — recvw() failed to receive message from e.
- 215xx — msgenab() failed.
- 216xx — Bad message received from Maintenance Input Request Administrator (MIRA).
- 217xx — After MIRA removed disk from service, database does not have disk as OOS.
- 218xx — ugmamirids() failed to get UCB record.
- 219xx — close() failed to close file e.
- 220xx — stat() failed on e.
- e Indicates system error code (See System Error Codes Output Appendix, APP:SYSERR).
- f Supplementary data.

SEE PROPRIETARY NOTICE ON COVER PAGE

KERNEL RESPONSE TIMEOUT d

2. REASON FOR OUTPUT

Response to a CLR:RUTIL or CLR:RUTIL (with FLAG option) input command.

Formats 1 and 2 indicate a successful completion of the CLR:RUTIL and the CLR:RUTIL (with FLAG option) input commands, respectively.

Format 3 indicates that the breakpoint specified is invalid.

Format 4 indicates that the specified breakpoint is not set up.

Format 5 indicates that the breakpoint has an illegal status.

Formats 6 and 7 indicate that a memory protection error has occurred.

Formats 8 and 9 indicate that creating the special file for the kernel has failed.

Formats 10 and 11 indicate that attempting to open the file for the kernel processing has failed.

Formats 12 and 13 indicate that the kernel has returned a failing return code.

Formats 14 and 15 indicate that the kernel has not responded to the craft process.

3. VARIABLE FIELD DEFINITIONS

aa	The group number of the concerned node.
b	The member number of the concerned node.
c	The specified breakpoint number.
d	The value of the global variable errno.
e	Illegal breakpoint status value.
f	Memory protection error return.

4. ACTION TO BE TAKEN

For Formats 3 and 4, check the specified breakpoint number.

Otherwise seek technical assistance for Formats 5 through 15.

- [4] RING CLR T1M STOPPED
T1M a b CLEAR PDCNTS e REQUEST DENIED
ULN (PD) GUARD TIMER TIMEOUT,
T1M CAN'T PROCEED WITHOUT DATA FROM e

2. REASON FOR OUTPUT

This message is output in response to the CLR:T1M input message. This message reports the results of a request to clear the Errored Extended Super Frame (ERRESF) count or the Performance Measurements Data counts of the Universal Link Nodes (ULNs) and Network Channel Office Equipments (NCOEs)

The Errored Extended Super Frame (ESF) count in the ULN is an ongoing accumulation of CRC6 Error Events and Out-of-Frame Error Events. This count, kept ONLY in the ULN, continues to increase in value as these error events occur, until the count is manually cleared with this CLR:T1M,ERRESF input command or the count reaches its maximum value of 65535. Once this counter reaches this maximum value, it stays stuck at this value until manually cleared.

This Errored ESF counter is displayed each time the ULN T1 termination's status is requested with the OP:T1M,ST input command.

The Errored ESF counter is NOT administered on periodic 15-minute intervals into historical counts as are the other Performance Measurements Data Counts described.

The addressable T1 termination's other Performance Measurements Data Counts are counts of Errored Seconds (ES), Failed Seconds (FS) (or Unavailable), Bursty Errored Seconds (BES), Severely Errored Seconds (SES), Slip Buffer Overflow/Underflow (SLIPS),

SEE PROPRIETARY NOTICE ON COVER PAGE

and Loss-of-Frame Count (LOFC). A Current (15-minute) Interval set of these counts and up to 96 Historical (15-minute) Interval sets (or 24 hours' worth) of these counts are retained. The "15-minute intervals" are aligned with the network clock time.

The single set of Current Interval Counts are kept ONLY in the ULN, and they contain counts accumulated thus far into the "current 15-minute interval" from the last 15-minute interval boundary. Whenever the current interval counts are requested, they are obtained from the ULN for display.

At each "15-minute interval" boundary, the current interval set of counts in the ULN is moved into the ULN's most recent historical set of counts, and each of the ULN's other historical sets of counts is moved down into the next older set of ULN historical counts. All counts in the ULN (current and historical) are lost on ULN removal/restoral.

Sent up to the 3B where it is stored in Protective Application Segment (PAS) memory as part of the historical counts. The PAS historical counts will survive ULN removal/restoral.

The CLR:T1M,PDCNTS, . . . ;NEULN form of the input command clears both the 3B copy and the ULN copy of the historical counts.

The CLR:T1M,PDCNTS, . . . ;FEULN form of the input command clears ONLY the far-end ULN's copy of the historical counts. It does NOT clear the copy of the far-end ULN's historical data stored in the far-end 3B.

Both forms of the command cause the "Current Interval" set of counts, kept only in the ULN, to be cleared.

Thus, by using either the NEULN or FEULN form of the CLR:T1M,PDCNTS input command, it is possible to clear either one or both copies of a ULN T1 termination's historical counts.

3. VARIABLE FIELD DEFINITIONS

- a The group number of the link node (00-63).
- b The member number of the link node (1-15).
- c ULN T1 termination's target address (A or Z) or the NCOE T1 termination's target address (C-X).
- d Current Network time of day report completed.
- e NEULN — The CLR:T1M,PDCNTS, . . . ;NEULN form of the input command has been used. This form of the command clears current interval counts and both the 3B and the ULN copies of the historical sets of counts.

FEULN — The CLR:T1M,PDCNTS, . . . ;FEULN form of the input command has been used. This form of the command clears current interval counts and ONLY the far-end ULN's copy of the historical sets of counts. The far-end 3B's (PAS) copy of the far-end ULN's historical counts are NOT cleared.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Formats 1-2, None.

Format 3, Try the command again. If the problem persists with the FEULN command form, then try the NEULN command form of this command. (This form can work even if the ULN T1 link is down.) If neither form works, seek technical assistance.

Format 4, Try the command again If the problem persists with the FEULN command form, then try the NEULN command form of this command. (This form can work even if the ULN T1 link is down.) If neither form works, seek technical assistance.

WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] CLR UMEM [UCL] a WAS b NOW c #d
- [2] CLR UMEM COMPLETED CKT FAILURE #d

2. REASON FOR OUTPUT

To report the disposition of a CLR:UMEM input message or to report that the Process Identification (PID) listed on the INIT:UMEM message aborted.

3. VARIABLE FIELD DEFINITIONS

- UCL Unconditional execution.
- a Status of the operation:
- COMPLETED — The trace definition has been cleared.
- NOT STARTED — The operation was ignored because data loss might have resulted.
- STOPPED UCERR — The utility circuit either does not respond or does not match the circuit present when the trace was defined.
- b State of the trace before the operation was attempted:
- DUMPED — The trace was not running and its data had already been dumped.
- NEW — The trace was not running and did not have data.
- RUNNING — The trace was collecting data.
- STOPPED — The trace was not running and did have data.
- c State of the trace after the operation was attempted.
- RUNNING — The trace is collecting data.
- STOPPED — The trace is stopped and does contain data.
- UNDEF — No trace is defined.
- d Generic Access Package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If the status is NOT STARTED, the trace must be in the NEW or DUMPED state in order to be cleared. Use the INH:UMEM and/or the OP:UMEM input messages before reissuing the CLR:UMEM input message.

If the status is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

To report the result of executing an CMPR:MHD input message. The [R0] is output to indicate that the READ ONLY option was used. STIME is the time the message was started. ETIME is used to indicate the elapsed time for a particular partition. The ETIME for the FINAL message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

- a Member number of the first unit of the Moving Head Disk (MHD) drive.
- b Process step or reason code:
- bxx — where xx are hex digits - see DFC Output Appendix A, APP:DFC-A.
 - f03 — cannot open Equipment Configuration Database (ECD)
 - f06 — cannot get Unit Control Block (UCB) of first unit by name
 - f09 — cannot get UCB of second unit by name
 - f12 — cannot get UCB of first unit's mate
 - f15 — cannot get UCB of first unit's mate
 - f18 — cannot reserve UCB of second unit
 - f21 — cannot assign special device file name of second unit
 - f24 — cannot open special device file of second unit
 - f27 — cannot enable message reception
 - f30 — see accompanying DKDRV error report on the ROP
 - f36 — failed to close special device file of second unit
 - f39 — failed to release special device file of second unit
 - f42 — message to port failure
 - f45 — message reception failure
 - f48 — message to port failure
 - f51 — message reception failure
 - f54 — process timed out
 - f57 — failed to close special device file of second unit
 - f60 — failed to release special device file of second unit
 - f63 — failed to unreserve UCB of second unit
 - f66 — failed to close ECD
- c System error code number; see System Error Codes Output Appendix, APP:SYSERR.

SEE PROPRIETARY NOTICE ON COVER PAGE

RO	Indicates that the READ ONLY option was selected.
d	First disk block number (of a range) that mismatched or retried while being compared.
e	Last disk block number (of a range) that mismatched, failed, or successfully retried while being compared.
f	Partition number in use when a mismatch was encountered.
g	Offset within partition when mismatch was detected.
h	Member number of the second unit of the MHD drive.
i	Number of mismatches that were detected.
j	Number of Input/Output jobs done.
k	Number of errors detected doing I/O.
STIME	The time the compare of the partition was started. For the FINAL SUMMARY report, STIME indicates the start time of the input message.
l	Time in the form hh:mm:ss, hours, minutes, and seconds.
ETIME	Elapsed time for a partition to compare. For the FINAL SUMMARY report, the ETIME is the total elapsed time of all the partitions.
m	Size of the partition given in disk blocks.
n	Disk block number that failed to read or write.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation, and try the input request again.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

ID COPY:0
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY a b #c
- [2] COPY d NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS e
- [3] COPY d NOT STARTED
INVALID ID FIELD
- [4] COPY d NOT STARTED
RETRY LATER

2. REASON FOR OUTPUT

To report the completion of a COPY: input message.

3. VARIABLE FIELD DEFINITIONS

- a Source of the data copied:
 - ADDR f — Virtual address.
 - PID h, ADDR f — Process ID of process and virtual address.
 - REG e — Register.
 - UID g, ADDR f — Utility ID of process and virtual address.
 - UVAR d — Utility variable.
- b Termination status of the operation:
 - COMPLETED — Request successfully completed.
 - NOT STARTED NGPID — The COPY was stopped because the process does not exist.
 - NOT STARTED NGUID — The COPY was stopped because no copies of the process exist.
 - STOPPED NGADDR — The COPY was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.
 - STOPPED NGCOPY — The COPY was stopped because some other error occurred in moving the data.
 - STOPPED NGPROT — The COPY was stopped because the destination address does not have write permission granted.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Generic Access Package (GRASP) execution sequence number.
- d PID — Process ID.
UID — Utility ID.
- e Bad Process ID.

4. ACTION TO BE TAKEN

If variable b is:

NOT STARTED NGPID, the process did not exist at the time the COPY was attempted.
Consider using the process UID instead of the PID.

NOT STARTED NGUID, the process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the copy command in the action list. This will help control the exact circumstances under which the operation is performed.

STOPPED NGPROT, recheck the destination to verify that it indicates a writable area. To change program text, use the LOAD:UPNM input message.

ID COPY:ACTDISK
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY ACTDISK ON MHD a COMPLETED
- [2] COPY ACTDISK STOPPED WITH ERROR CODE b ERRNO c[, (d)]

2. REASON FOR OUTPUT

To report the result of executing a COPY:ACTDISK input message.

3. VARIABLE FIELD DEFINITIONS

- a Disk unit to which file was copied.
- b Error code indicating error that caused process to terminate. The first three digits indicate the nature of the error; the last two (represented as xx) indicate which module the error occurred in (the information is not provided here).
- 101xx — Missing arguments. This error is related with the usage of the /prc/mntfs process. The arguments expected by this process are: /prc/mntfs -d a -p b -, c -x d. Where a specifies the non-active disk, b the target file system, c the directory to mount the file system, d the name of the process, plus arguments, to be executed. The arguments should consist of files or directory path names, including the mount directory specified in c.
- 102xx — The partition number that corresponds to the mount point of the destination file, is not the same as the destination partition number. To by pass this check, don't include the mount point in destination file name. For example, to copy /etc/ularp to the root file system on the non-active disk, don't specify /etc/ularp as the destination file; instead the name ularp or /ularp should be specified.
- 103xx — The source specified is not a regular file, a contiguous file (type C or x), or a block device (type b, a partition or file system).
- 104xx — Cannot find mount point for destination file. To avoid the error, exclude the mount point from the destination file path name.
- 105xx — The destination disk specified is not in the Out Of Service (OOS) or Offline (OFL) state.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 106xx — Cannot find an entry for the destination partition, in the destination disk Volume Table Of Contents (VTOC). Make sure that the partition number specified exists in the destination disk.
- 107xx — Bad mount directory specified. This error results from the execution of the /prc/mntfs process.
- 108xx — The VTOC in the destination disk is bad or does not exist.
- 109xx — Bad destination file specified.
- 110xx — Process stopped due to SIGTERM signal.
- 111xx — The source file specified does not exist.
- 112xx — Cannot find entry for the source partition on the active disk VTOC.
- 113xx — The destination partition is smaller than the source partition.
- 114xx — The partition number specified is greater than the maximum number of partitions on disk.
- 115xx — The destination partition does not exist in the destination disk.

Errors Associated with System Calls

- 201xx — The open() failed to open d.
- 202xx — mknod() failed to create d.
- 203xx — read() failed to read file d.
- 204xx — mkseg() failed to allocate one segment of memory.
- 205xx — lseek() failed to change offset (see d) in out of service disk.
- 206xx — setio() failed to set physical IO for d.
- 207xx — write() failed on segment d.
- 208xx — ugucbn() failed to get Unit Control Block (UCB) information for Moving Head Disk (MHD) d. This error occurs when disk unit specified does not exist.
- 209xx — mount() failed to mount partition d. This error occurs when partition is not a file system, or mount directory is busy.
- 210xx — unlink() failed to unlink file d.
- 211xx — ursvucb() failed to reserve MHD d. This error occurs when the disk is reserved by other process (for example, diagnostics).
- 212xx — udsdf() failed to get special device file to access MHD d. This error occurs when another process failed to release the special device file.
- 213xx — msgport() failed to send message to the disk driver.
- 214xx — recvw() failed to receive message from the disk driver.
- 215xx — msgenab() failed.
- 216xx — Bad message received from the disk driver.
- 217xx — Bad return code received from the disk driver. This error occurs when the entry in destination disk VTOC does not have all the fields properly set (e.g., the address for the partition may be bad).

SEE PROPRIETARY NOTICE ON COVER PAGE

- 218xx — chown() failed to change owner for destination file.
- 219xx — close() failed to close d.
- 220xx — stat() failed on d.
- 221xx — plock() failed to lock /prc/mntfs process in core.
- 222xx — chmod() failed to change mode of destination file.
- 223xx — system() call returned with an error code d.
- 224xx — create() failed to create the destination file, on file system in the destination disk. This error occurs when there is no more space in the file system.
- 225xx — falloc() failed to allocate contiguous space for a contiguous file, on the file system in the destination disk. This error occurs when the file system does not have enough contiguous space for the file to be created.
- 226xx — ugetrec() failed to get UCB record for destination disk MHD a in the ECD database.

- c Indicates system error code (see System Error Codes Output Appendix, APP:SYSERR).
- d Supplementary data.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

- [1] COPY ADDR a b #c
- [2] COPY ADDR {PID|UID} NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS d
- [3] COPY ADDR {PID|UID} NOT STARTED
INVALID ID FIELD e
- [4] COPY ADDR {PID|UID} NOT STARTED
RETRY LATER f

2. REASON FOR OUTPUT

To report the completion of a COPY input message.

3. VARIABLE FIELD DEFINITIONS

- a Virtual address.
- b Termination status of the operation:
 - COMPLETED — Request successfully completed.
 - NOT STARTED NGPID — The COPY was stopped because the process does not exist.
 - NOT STARTED NGUID — The COPY was stopped because no copies of the process exist.
 - STOPPED NGADDR — The COPY was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.
 - STOPPED NGPROT — The COPY was stopped because the destination address does not have write permission granted.
 - STOPPED NGCOPY — The COPY was stopped because some other error occurred in moving the data.
- c Generic Access Package (GRASP) execution sequence number.
- PID Process Identification.
- UID Utility Identification.
- d Bad PID.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e Test phrase:
- EXTRA KEYWORD (PID).
- INCONSISTENT KEYWORDS (NL-OFF).
- INPUT ERROR (OFF COUNT).
- INVALID KEYWORD.
- RANGE ERROR (L or NL).
- RANGE ERROR (PID).
- RANGE ERROR (UVAR).
- f The system is in an overload condition.

4. ACTION TO BE TAKEN

If termination status is NOT STARTED NGPID, the process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.

If termination status is NOT STARTED NGUID, the process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

If termination status is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY command in the action list. This will help control the exact circumstances under which the operation is performed.

If termination status is STOPPED NGPROT, recheck the destination to verify that it indicates a writable area.

CAREFULLY.**

ID COPY:APPDB
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

WARNING

If a copy to the ACTIVE partition aborts prematurely, the ACTIVE database will most likely be left in a corrupt state. This requires immediate attention. Retry the copy message immediately. If the reattempt does not succeed, notify NESAC immediately.

The COPY:APPDB to ACT message should be used with extreme care.

1. FORMAT

- [1] COPY APPDB FROM a TO b IN PROGRESS
COPY APPDB FROM c TO d
- [2] COPY APPDB FROM a TO b COMPLETED
- [3] COPY APPDB ACTIVE DATABASE HAS 4E16 FORMAT - VALID SID REQUIRED
- [4] COPY APPDB CANNOT OPEN c - e
- [5] COPY APPDB SOURCE DATABASE c FORMAT ERROR
- [6] COPY APPDB CANNOT CHECK MAGIC FOR c - e
- [7] COPY APPDB CANNOT CREATE SEGMENT - e
- [8] COPY APPDB CANNOT SETIO ON SOURCE DEV - e
- [9] COPY APPDB CANNOT SETIO ON DEST DEV - e
- [10] COPY APPDB CANNOT READ c - e
- [11] COPY APPDB CANNOT WRITE c - e
- [12] COPY APPDB DEST DATABASE HAS INV FORMAT, DON'T USE APP KW

2. REASON FOR OUTPUT

Print the results of copying an application database. Formats 1 and 2 indicate that the copy is in progress or has completed successfully. The other formats indicate that there was a problem with the copy and it has stopped.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Application partition that is affected. Valid values are:
- ACT — Active partition, /dev/appdb0
- SCRATCH — Scratchpad partition, /dev/appdb2
- SHADOW — Backup partition, /dev/appdb1
- b Application partition that is affected. Valid values are:
- ACT — Active partition, /dev/appdb0
- SCRATCH — Scratchpad partition, /dev/appdb2
- SHADOW — Backup partition, /dev/appdb1
- c Filename of the partition that is affected. Valid values are:
- /dev/appdb0 — Active partition
- /dev/appdb1 — Backup partition
- /dev/appdb2 — Scratchpad partition
- d Filename of the partition that is affected. Valid values are:
- /dev/appdb0 — Active partition
- /dev/appdb1 — Backup partition
- /dev/appdb2 — Scratchpad partition
- e Error code indicating why the copy was not successful.

4. ACTION TO BE TAKEN

When the copy is complete, the copy can be verified with the VER:MEMORY and the VER:GTT commands. The most likely cause of an unsuccessful copy is that system conditions (insufficient resources) preclude the ability to copy at the current time. Retry the copy message later. If the copy cannot be successfully completed after a small number of attempts, NESAC should be notified.

- [5] COPY BKDISK STOPPED
CANNOT EXECUTE CHILD PROCESS

2. REASON FOR OUTPUT

To report the progress of the COPY:BKDISK input message, or to indicate a problem.

3. VARIABLE FIELD DEFINITIONS

- a Status messages:
 - CANNOT LOCK PROCESS IN CORE — Cannot lock Physical Disk-To-Tape (PDT) writer process program in core. This may slow down the system processing.
 - COM OPTION MISUSED. ISSUE COMMAND AGAIN. — The COM option was used on RTR boot disks that do not have a common VTOC. A common RTR VTOC includes both the 3B20D/3B21D VLMM and the 3B21D lboot partitions. Issue the command again without the COM option.

SEE PROPRIETARY NOTICE ON COVER PAGE

COM OPTION NEEDED. ISSUE COMMAND AGAIN. — The COM option is needed, since the RTR boot disk image being created has a VTOC including both the 3B20D/3B21D VLMM and the 3B21D lboot partitions. Issue the command again with the COM option.

COMMON TAPE - BOTH LBOOTS WILL BE WRITTEN. — This informs the user that even though only one lboot partition was specified in the specfile, the lboot partition for the processors will be written to tape. Both partitions are written, since the Volume Table Of Contents (VTOC) on the disk is common.

COMPLETED. DISMOUNT DATABASE TAPE AND LABEL — Dismount the tape and label it as required by local procedures.

COMPLETED. DISMOUNT GENERIC TAPE AND LABEL — Dismount the tape and label it as required by local procedures.

COMPLETED. DISMOUNT TAPE AND LABEL — Dismount the tape and label it as required by local procedures.

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE — End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT DATABASE TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE — If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE — End of tape has been reached. There are 10 minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

DISMOUNT GENERIC TAPE LABEL AND MOUNT NEXT TAPE LAST CHANCE — If the previous message was not executed within the prescribed time limit, a new limit of 20 minutes is set.

DISMOUNT TAPE LABEL AND MOUNT NEXT TAPE — End of tape has been reached. There are ten minutes in which to dismount the tape, label it, and mount a new tape. COPY:BKDISK;ACK input message must be entered to continue the process (see COPY:BKDISK, Format 2).

IN PROGRESS — Procedure is proceeding normally.

STOPPED — Physical disk-to-tape writer has been stopped.

SEE PROPRIETARY NOTICE ON COVER PAGE

CAN'T OPEN TAPE. CHECK DATA FIELD AND TRY AGAIN — The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CAN'T OPEN TAPE. NEED TO RE-WRITE ENTIRE SEQUENCE — The tape name given could not be opened. There may be an error in the arguments to the TAPE keyword, or possibly the tape drive is not on-line.

CANNOT OPEN TAPE DATA — This message indicates that the open to the tape device failed. This may be due to the tape drive being off-line or the tape being write protected. A message will follow indicating to mount tape and acknowledge. There will be four chances given to mount a tape.

CANNOT RUN WITH SYSTEM OR FIELD UPDATE, OR ANOTHER COPY BKDISK — The COPY:BKDISK message cannot run simultaneously with a field update or system update message (any UPD input message), and cannot run while another COPY:BKDISK message is in progress.

COPY BKDISK START WAS NOT ISSUED — The COPY:BKDISK;ACK input command was issued before a COPY:BKDISK;START command.

INVALID SPECFILE — Make sure that partition names were specified in the specification file.

MOUNT TAPE AGAIN AND ACKNOWLEDGE LAST CHANCE — This message will be output as the last warning for mounting a tape successfully. The COPY:BKDISK message will abort after 20 minutes.

MOUNT TAPE AND ACKNOWLEDGE — This message is printed after a previous request to mount a tape failed (for example, the open() of the tape failed), or if the COPY:BKDISK;ACK input message is not entered to continue the process. There are seven chances to mount a tape successfully, before the COPY:BKDISK;START input message aborts.

MRG OPTION INCORRECTLY USED — Specification file does not have database and generic partitions. This option should be used when there is a need to create one sequence for generic and database partitions.

SEE PROPRIETARY NOTICE ON COVER PAGE

RE-INITIALIZE ENTIRE SEQUENCE — This message indicates that the entire tape writing procedure must be re-initiated using the COPY:BKDISK;START input message.

TAPE CHANGE ACTION INCORRECT — The action taken to change the tape was incorrect. This can occur if the time limits were exceeded, an invalid tape size was entered, or no tape size was entered. This message is followed immediately by RE-INITIATE ENTIRE SEQUENCE.

TAPE SIZE OUT OF RANGE RE-ENTER COMMAND — An incorrect tape size was entered for the tape device specified. The acceptable range for a 9-track tape is 600 to 2400 feet and the acceptable range for a DAT is 30 to 90 meters.

TAPE WRITE ERROR. NEED TO RE-WRITE ENTIRE SEQUENCE — A physical error was encountered while writing to the tape. This error may also appear if an incorrect device name was specified for 'EXT' (extended) format. Mount tape on proper device if necessary and enter COPY:BKDISK;START input message.

TAPE WRITE ERROR MOUNT NEW TAPE AND TRY AGAIN — A physical write error was encountered while writing to the tape. It may be necessary to mount a new tape, since write errors occur due to bad spots on tape. COPY:BKDISK;ACK input message must be entered to rewrite the tape.

C The procedure has been terminated for one of the reasons defined in the error code:

- 1 — A read of VTOC indicated zero bytes read.
- 2 — Error on read of VTOC.
- 3 — Second VTOC entry is not for 'VTOC' itself (the VTOC partitions may not be valid).
- 4 — Failed on setio system call for tape.
- 5 — Unable to open device directory /dev.
- 6 — The stat() UNIX® function failed to get device information for the diskname specified.
- 7 — The stat() UNIX® function failed to get device information for a partition name in the /dev directory.
- 8 — Two partition names specified in the specification file are duplicate (map into the same partition on disk). Remove one partition name and try again.
- 9 — Error in reading /dev device directory entries.
- 10 — Did not find stat() information for all partition names specified in specification file. One or more partition names specified may reside in a different disk. Remove these partition names and try again.
- 11 — Failed on open of partition.
- 12 — Failed on setio system call for disk.
- 13 — Error on read of partition.
- 14 — Unable to add data segment to address space.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 15 — Cannot open specification file. This file may not exist, or may be zero length. Add required partition names and try again.
- 16 — The COPY:BKDISK;ACK input message cannot open /tmp/pdt to get the process ID of the COPY:BKDISK;START message.
- 17 — Too many partitions specified in the specification file.
- 18 — The stat() function failed to get device information for a partition name in the /etc/pdtspec file (this partition may not exist), or the stat() function could not find the name of the disk device or tape device entered on the message line. The name entered is not a special device name. Replace the name and try again.
- 19 — Name specified in the specification file is not a partition (file is not a block device). Replace with the proper partition name and try again.
- 20 — The lla_dbatt() function failed to attach to the System Generation (SG) database (to get the SG time stamp that is included in the first header of a tape sequence).
- 21 — The lla_rdget() function failed to get the sghdr_rec record from the SG.
- 22 — Failed on lla_dbrel call.
- 23 — The getdbseg() function failed to attach to the Equipment Configuration Database (ECD) (to get the generic version to be included in the first header of a tape sequence).
- 24 — The lla_iatt() function failed trying to attach to the incore database.
- 25 — A tape sequence was not effective for a generic or database (internal error in the COPY:BKDISK;START message). Try the entire procedure again.
- 26 — The system call close() failed when trying to close the partition that was opened to read the data.
- 27 — The system call unlink() failed when trying to unlink the partition already written to tape.
- 28 — The system call mknod() failed when trying to create a special device file or a partition.
- 29 — The system call lseek() failed when trying to find the disk offset to rewrite the tape.
- 30 — The lla_rdget() function failed to get the ecdorg, ucb, or mdct records from the ECD.
- 31 — The lla_get() function failed to get the logdev record from the ECD.
- 32 — The tape device being used is not compatible with the EXT option. The EXT option is always compatible with a processor or an Administrative Work Station (AWS) tape device, since data to be written is broken up into 6K-size records by default. On the 3B21D, data is not broken up into 6K-size records by

SEE PROPRIETARY NOTICE ON COVER PAGE

default. This error occurs if you are on the 3B21D and the logdev record for the tape device specified has one of the characteristics:

1. is of type IOP
2. has a fixed blocking factor
3. has a blocking factor not equal to 6K

The blocking factor for some tape devices can be determined by their naming convention. Refer to the “Magnetic Tape Special Device File Names” chapter of the *Lucent Technologies 3B20D and 3B21D Computers UNIX RTR Operating System, System Maintenance Manual* for tape device naming conventions. Seek technical assistance if necessary.

- 33 — The ECD mdct record for the source disk references more than two units.
- 34 — The ECD mdct record for the source disk does not reference any units.
- 35 — No BBOOT partition entries were found in the RTR boot disk VTOC.
- 36 — A BACKUP BBOOT partition entry was not found in the RTR boot disk VTOC.
- 37 — A PRIMARY BBOOT partition entry was not found in the RTR boot disk VTOC.

- d System error code number (see the System Error Codes Output Appendix, APP:SYSERR).
- e Tape library error code number (see the Tape Library Error Appendix, APP:TAPE-LIB).

4. ACTION TO BE TAKEN

Format 2 execution errors (error codes 8, 10, 15, 17, 18, and 19) can be corrected by examining the procedures used for execution of the message. Seek technical assistance for all other error codes.

Format 4 errors pertain to multi-volume digital audio tapes and will be accompanied by explanatory text. If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and that the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

Format 5 indicates that there is a problem invoking the `/prc/3btpwrt` process. Verify that the process exists and is executable. If these checks fail to uncover the problem, seek technical assistance.

WRITE FAILED TO OUTPUT DEVICE, ERROR b]

2. REASON FOR OUTPUT

To report the status of a request to copy the contents of a multi-volume Digital Audio Tape (DAT) to a destination DAT.

3. VARIABLE FIELD DEFINITIONS

a Request status.

ABORTED — The copy failed and was aborted.

COMPLETED — The copy completed with no errors.

IN PROGRESS — The copy is in progress.

SEE PROPRIETARY NOTICE ON COVER PAGE

- STARTED — The copy started.
- STOPPED — The copy failed and was stopped.
- b System error code number (see the System Error Codes Output Appendix, APP:SYSERR).
- c Internal error code for failure of an Equipment Configuration Database (ECD) access function.
- 1 — getdbseg failed, could not attach to the ECD
 - 2 — lla_iatt failed, could not attach to the incore database
 - 3 — lla_rdget failed, could not get the ecdorg record from the ECD
 - 4 — lla_get failed, could not get the logdev record for the source tape device from the ECD
 - 5 — lla_rdget failed, could not get the mdct record for the source tape device from the ECD
 - 6 — lla_rdget failed, could not get the ucb record for the source tape device from the ECD
 - 7 — lla_get failed, could not get the logdev record for the destination tape device from the ECD
 - 8 — lla_rdget failed, could not get the mdct record for the destination tape device from the ECD
 - 9 — lla_rdget failed, could not get the ucb record for the destination tape device from the ECD
 - 10 — rmovdbseg failed, could not remove incore database segments
- d Tape library error code number (see the Tape Library Error Appendix, APP:TAPE-LIB).

4. ACTION TO BE TAKEN

Errors will be accompanied by explanatory text. Verify that the command that was input is consistent with the COPY:BKTAPE input message. If the message indicates that there is a problem with a tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing a tape drive, verify that a tape is loaded and that the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

STIME hh:mm:ss ETIME hh:mm:ss

2. REASON FOR OUTPUT

To report the result of executing a COPY:DIFF input message. STIME is the time the message was started. ETIME is used to indicate the elapsed time for a particular partition. The ETIME for the FINAL message is the total elapsed time.

3. VARIABLE FIELD DEFINITIONS

- a Member number of the source disk of the Moving Head Disk (MHD) drive.
- b Process step or reason code:
- f03 — Cannot open Equipment Configuration Database (ECD).
 - f06 — Cannot get Unit Control Block (UCB) of first unit by name.
 - f09 — Cannot get UCB of second unit by name.
 - f12 — Cannot get UCB of first unit's mate.
 - f15 — Cannot get UCB of first unit's mate.
 - f18 — Cannot reserve UCB of second unit.
 - f21 — Cannot assign special device file name of second unit.
 - f24 — Cannot open special device file of second unit.
 - f27 — Cannot enable message reception.
 - f30 — See accompanying DKDRV error report on the receive-only printer.
 - f36 — Failed to close special device file of second unit.
 - f39 — Failed to release special device file of second unit.
 - f42 — Message to port failure.
 - f45 — Message reception failure.
 - f48 — Message to port failure.
 - f51 — Message reception failure.
 - f54 — Process timed out.
 - f57 — Failed to close special device file of second unit.
 - f60 — Failed to release special device file of second unit.
 - f63 — Failed to unreserve UCB of second unit.
 - f66 — Failed to close ECD.
- c System error code number. See System Error Codes Output Appendix, APP:SYSERR.

SEE PROPRIETARY NOTICE ON COVER PAGE

d	First disk block number (of a range) that mismatched while being compared.
e	Last disk block number (of a range) that mismatched while being compared.
f	Partition number in use when a mismatch was encountered.
g	Offset within partition when mismatch was detected.
h	Number of mismatches that were detected.
i	Number of corrections that were made.
j	Number of Input/Output jobs done.
k	Number of errors detected doing I/O.
STIME	The time the compare of the partition was started. For the FINAL SUMMARY report, STIME indicates the start time of the input message.
hh	Hours.
mm	Minutes.
ss	Seconds.
ETIME	Elapsed time for a partition to compare. For the FINAL SUMMARY report, the ETIME is the total elapsed time of all the partitions.
l	Disk block number that failed to read or write.
m	Size of the partition given in disk blocks.

4. ACTION TO BE TAKEN

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried.

Appropriate mismatch messages will be generated indicating the range of disk blocks where the mismatch occurred. A maximum of eight mismatch error messages will be output per partition. More than eight mismatch messages will result in an early termination.

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY FILESYS CFILE COMPLETED
- [2] COPY FILESYS CFILE STOPPED
a

2. REASON FOR OUTPUT

To report the result of executing a COPY:F-CFILE input message to move a file to a contiguous area.

3. VARIABLE FIELD DEFINITIONS

- a The description of the error encountered.

4. ACTION TO BE TAKEN

Format 1 indicates success, and no action is necessary.

If Format 2 is printed, the explanatory text will indicate the error encountered. Verify that the command that was input is consistent with the COPY:F-CFILE input message. Use the OP:ST-LSTDIR input message to verify that the file exists with the appropriate permissions. If the message indicates that there is not enough space on the file system, use the CLR:F-FILE input message to remove some files to create the file space.

If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

To report the result of executing a COPY:OOSDISK input message.

3. VARIABLE FIELD DEFINITIONS

- a Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with UNIX® system calls:
 - 01x — mkseg error.
 - 02x — Open error.
 - 03x — Read error.
 - 04x — Stat error.
 - 05x — Write error.
 - 06x — Close error.
 - 07x — Unlink error.
 - 08x — setio error.
 - 09x — mknod error.
 - 10x — msgenab error.
 - 11x — Send error.
 - 12x — msgport error.
 - 13x — Mount error.
 - 14x — umount error.
 - 15x — cp error.
- b Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with input message format:
 - 20x — Invalid arguments. The source or destination filename may not exist.
 - 22x — Process stopped by an interrupt or termination signal.
 - 25x — Bad pathname specified for source file.
 - 26x — Disk containing source file is active.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with the System Integrity Monitor (SIM), the Maintenance Input Request Administrator (MIRA), and the disk driver:
- 30x — Message not what was expected.
 - 31x — Tried to reserve two disks.
 - 32x — Tried to release unreserved disk.
 - 33x — New disk state bad.
 - 36x — Timeout for MIRA message.
 - 37x — Timeout for disk driver message.
 - 38x — Bad MIRA return on message.
 - 39x — Bad disk driver return on message.
 - 40x — State result bad.
 - 41x — Timeout for SIM message.
- d Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with Equipment Configuration Database Manager (ECDMAN) user functions:
- 50x — ugetucb error.
 - 51x — ugmamirids error.
 - 52x — ursvucb error.
 - 53x — ugsdf error.
 - 54x — urelucb error.
 - 55x — ursdf error.
 - 56x — usettnum error.
 - 57x — usetucb error.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

5. REFERENCES

OMDB Key

Formats 1 and 2 have an OMDB key of 188.

Input Message

COPY:OOSDISK

SEE PROPRIETARY NOTICE ON COVER PAGE

ID COPY:P-ALL
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY PTN ALL COMPLETED
a BLOCKS COPIED
.
.
.
- [2] COPY PTN ALL STOPPED
{INVALID SOURCE/DESTINATION SPECIFIED {b|c|d|e} |
PROCESS STOPPED {b|c|d|e} |
DISK ACCESS PROCEDURE ABORTED {b|c|d|e} |
CANNOT COPY PARTITION {b|c|d|e} |
DISK RESTORAL PROCEDURE ABORTED {b|c|d|e} |
CANNOT CONNECT TO SYSTEM UPDATE PORT}

2. REASON FOR OUTPUT

Format 1 indicates the input message completed and successfully invoked the process that copies partions. For each partition, the number of blocks copied is output.

Format 2 indicates the process that copies partitions did not complete successfully. The reason for stopping is indicated.

3. VARIABLE FIELD DEFINITIONS

- a Number of blocks copied (for each partition copied).
- b Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module of UNIX® RTR code in which the error occurred. Errors associated with UNIX® operating system calls:
- 1x — mkseg error.
 - 2x — Open error.
 - 3x — Read error.
 - 4x — Stat error.
 - 5x — Write error.
 - 6x — Close error.
 - 7x — unlink error.
 - 8x — setio error.
 - 9x — mknod error.
 - 10x — msgenab error.
 - 11x — Send error.
 - 12x — msgport error.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c
- Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module of UNIX® RTR code in which the error occurred. Errors associated with execution:
- 20x — Invalid arguments. The source or destination filename may not exist, or does not contain a valid list of partition names. The source/destination partition names specified may not be special devices, or they do not exist in the disk. Make sure that valid source/destination partition names are used.
 - 21x — Destination is small. Cannot copy to a partition that is smaller than the source partition. Make sure that the destination partition specified is not smaller than the source partition.
 - 22x — Process stopped by an interrupt or termination signal.
 - 23x — Cannot overwrite destination partition. The destination specified may be an active partition or currently in use. For example, if the system is running on primary, /dev/root is an active partition. A partition with no backup is considered an active partition. Make sure that the destination partition specified is not an active partition.
 - 24x — Disk is not duplexed. Need both disks active before attempting to do a partition copy.
- d
- Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module of UNIX® RTR code in which the error occurred. Errors associated with the System Integrity Monitor (SIM), the Maintenance Input Request Administrator (MIRA), and the disk driver:
- 30x — Message not what was expected.
 - 31x — Tried to reserve two disks.
 - 32x — Tried to release unreserved disk.
 - 33x — New disk state bad.
 - 36x — Timeout for MIRA message.
 - 37x — Timeout for disk driver message.
 - 38x — Bad MIRA return on message.
 - 39x — Bad disk driver return on message.
 - 40x — State result bad.
 - 41x — Timeout for SIM message.

SEE PROPRIETARY NOTICE ON COVER PAGE

e Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module of UNIX® RTR code in which the error occurred. Errors associated with the Equipment Configuration Database Manager (ECDMAN) user functions:

50x — ugetucb error.
51x — ugmamirids error.
52x — ursvucb error.
53x — ugsdf error.
54x — urelucb error.
55x — ursdf error.
56x — usettnum error.
57x — usetucb error.
58x — ugetrec error.

4. ACTION TO BE TAKEN

For codes 20x-24x, correct the problem and reenter the input message. Seek technical assistance if any other error message is printed.

5. REFERENCES

OMDB Key

UNIX® RTR Operating System System Maintenance Manual

Input Message

COPY:P-ALL

SEE PROPRIETARY NOTICE ON COVER PAGE

ID COPY:PID
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY PID a b c #d
- [2] COPY PID {PID|UID} NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS e
- [3] COPY PID {PID|UID} NOT STARTED
INVALID ID FIELD f
- [4] COPY PID {PID|UID} NOT STARTED
RETRY LATER g

2. REASON FOR OUTPUT

To report the completion of a COPY input message.

3. VARIABLE FIELD DEFINITIONS

- a Process ID.
- b Source of the data copied.
 - ADDR x — Virtual address.
 - PID y, ADDR x — Process ID of process and virtual address.
 - REG y — Register.
 - UID y, ADDR x — Utility ID of process and virtual address.
 - UVAR y — Utility variable.
- c Termination status of the operation:
 - COMPLETED — Request successfully completed.
 - NOT STARTED NGPID — The COPY was stopped because the process does not exist.
 - NOT STARTED NGUID — The COPY was stopped because no copies of the process exist.
 - STOPPED NGADDR — The COPY was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.

SEE PROPRIETARY NOTICE ON COVER PAGE

	STOPPED NGPROT — The COPY was stopped because the destination address does not have write permission granted.
	STOPPED NGCOPY — The COPY was stopped because some other error occurred in moving the data.
d	Generic Access Package (GRASP) execution sequence number.
PID	Process Identification.
UID	Utility Identification.
e	Bad PID.
f	Test phrase: EXTRA KEYWORD (PID). INCONSISTENT KEYWORDS (NL-OFF). INPUT ERROR (OFF COUNT). INVALID KEYWORD. RANGE ERROR (L or NL). RANGE ERROR (PID). RANGE ERROR (UVAR).
g	The system is in an overload condition.

4. ACTION TO BE TAKEN

If the termination status is NOT STARTED NGPID, the process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.

If the termination status is NOT STARTED NGUID, the process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

If the termination status is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY command in the action list. This will help control the exact circumstances under which the operation is performed.

If the termination status is STOPPED NGPROT, recheck the destination to verify that it indicates a writable area.

TYPE Output

1. FORMAT

- [1] COPY SPDISK COPIED a BLOCKS
- [2] COPY SPDISK COMPLETED
- [3] COPY SPDISK STOPPED WITH ERROR CODE {b|c|d|e}

2. REASON FOR OUTPUT

To report the result of executing a COPY:SPDISK input message, and to provide status information.

3. VARIABLE FIELD DEFINITIONS

- a Number of blocks written for each partition copied.
- b Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with UNIX® system calls:
 - 01x — mkseg error.
 - 02x — Open error.
 - 03x — Read error.
 - 04x — Stat error.
 - 05x — Write error.
 - 06x — Close error.
 - 07x — unlink error.
 - 08x — setio error.
 - 09x — mknod error.
 - 10x — msgenab error.
 - 11x — send error.
 - 12x — msgport error.
 - 13x — mount error.
 - 14x — umount error.
- c Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with input message format:
 - 20x — Invalid arguments. The source or destination filename may not exist, or does not contain a valid list of partition names. The source/destination partition names specified may not be special devices, or they do not exist in the

SEE PROPRIETARY NOTICE ON COVER PAGE

disk. Make sure that valid source/destination partition names are used.

- 21x — Destination is small. Cannot copy to a partition that is smaller than the source partition. Make sure that the destination partition specified is not smaller than the source partition.
- 22x — Process stopped by an interrupt or termination signal.
- 24x — Disk is not duplexed. Need both disks active before attempting to do a cpspdisk.

d Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with the System Integrity Monitor (SIM), the Maintenance Input Request Administrator (MIRA), and the disk driver:

- 30x — Message not what was expected.
- 31x — Tried to reserve two disks.
- 32x — Tried to release unreserved disk.
- 33x — New disk state bad.
- 36x — Timeout for MIRA message.
- 37x — Timeout for disk driver message.
- 38x — Bad MIRA return on message.
- 39x — Bad disk driver return on message.
- 40x — State result bad.
- 41x — Timeout for SIM message.

e Numeric code for the error that caused the process to terminate. The least significant digit (represented as x) indicates the module in which the error occurred. x is not provided. Errors associated with Equipment Configuration Database Manager (ECDMAN) user functions:

- 50x — ugetucb error.
- 51x — ugmamirids error.
- 52x — ursvucb error.
- 53x — ugsdf error.
- 54x — urelucb error.
- 55x — ursdf error.

4. ACTION TO BE TAKEN

User execution errors can be corrected by examining the procedures used for execution of the message. If any other errors occur, seek technical assistance.

Input Message
COPY:T-TEST

SEE PROPRIETARY NOTICE ON COVER PAGE

ID COPY:T-TOP
WORK CENTER.. MOC
GENERIC 4AP14 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY TAPE TOP COMPLETED
a + a records in
a + a records out
- [2] COPY TAPE TOP COMPLETED
a + a records in
a + a records out
a + a records in
a + a records out
- [3] COPY TAPE TOP STOPPED
{NO TOPFILE EXISTS |
UNKNOWN HARDWARE PLATFORM |
dd: cannot open b |
dd: cannot create c |
dd: not enough memory |
dd read error |
dd write error}

2. REASON FOR OUTPUT

To report the result of executing a COPY:TAPE;TOP input message to copy a Tape-Only Program (TOP) file from disk to tape.

Format 1 prints when the input message executes successfully, and the COM option is not used. This output prints when copying the Standard Main Memory (SMM) or Expanded Main Memory (EMM) TOP file, the Very Large Main Memory (VLMM) TOP file, or the 3B21D TOP file, based upon the hardware-platform type.

Format 2 prints when the input message executes successfully, and the COM option is used. This output prints when copying both the VLMM TOP file and the 3B21D TOP file. The first set of record counts indicates the VLMM TOP file, and the second set of record counts indicates the 3B21D TOP file.

Format 3 prints when errors are encountered.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Record counts.
- b The pathname of a TOP file:
 /etc/topfile
 /etc/topfile21
 /etc/topfile32
 /etc/topfile64
- c The pathname specified in the input command for the tape drive.

4. ACTION TO BE TAKEN

For Format 3, if NO TOPFILE EXISTS prints, be sure that the correct topfile is present in the /etc directory.

If dd: cannot create /dev/mt... prints, refer to the input message for the correct format and try the input message again.

Seek technical assistance for any other Format 3 message.

5. REFERENCES

OMDB Keys
Formats 1, 2, and 3 have an OMDB key of 288.

Input Message
COPY:T-TOP

SEE PROPRIETARY NOTICE ON COVER PAGE

ID COPY:UID
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] COPY UID a b c #d
- [2] COPY UID {PID|UID} NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS e
- [3] COPY UID {PID|UID} NOT STARTED
INVALID ID FIELD f
- [4] COPY UID {PID|UID} NOT STARTED
RETRY LATER g

2. REASON FOR OUTPUT

To report the completion of a COPY input message.

3. VARIABLE FIELD DEFINITIONS

- a Utility ID.
- b Source of the data copied.
 - ADDR x — Virtual address.
 - PID y, ADDR x — Process ID of process and virtual address.
 - REG y — Register.
 - UID y, ADDR x — Utility ID of process and virtual address.
 - UVAR y — Utility variable.
- c Termination status of the operation:
 - COMPLETED — Request successfully completed.
 - NOT STARTED NGPID — The COPY was stopped because the process does not exist.
 - NOT STARTED NGUID — The COPY was stopped because no copies of the process exist.
 - STOPPED NGADDR — The COPY was stopped because the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were specified.

SEE PROPRIETARY NOTICE ON COVER PAGE

	STOPPED NGPROT — The COPY was stopped because the destination address does not have write permission granted.
	STOPPED NGCOPY — The COPY was stopped because some other error occurred in moving the data.
d	Generic Access Package (GRASP) execution sequence number.
PID	Process Identification.
UID	Utility Identification.
e	Bad PID.
f	Test phrase: EXTRA KEYWORD (PID). INCONSISTENT KEYWORDS (NL-OFF). INPUT ERROR (OFF COUNT). INVALID KEYWORD. RANGE ERROR (L or NL). RANGE ERROR (PID). RANGE ERROR (UVAR).
g	The system is in an overload condition.

4. ACTION TO BE TAKEN

If the termination status is NOT STARTED NGPID, the process did not exist at the time the COPY was attempted. Consider using the process UID instead of the PID.

If the termination status is NOT STARTED NGUID, the process did not exist at the time the COPY was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

If the termination status is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the COPY command in the action list. This will help control the exact circumstances under which the operation is performed.

If the termination status is STOPPED NGPROT, recheck the destination to verify that it indicates a writable area.

[15] COPY UPDATE ABORTED, RC ROLLBACK INIT FAILED

2. REASON FOR OUTPUT

To make a backup copy of a Generic (GEN), Library (LIB), Office Data Assembler (ODA), Network Management (NWM), or Traffic and Plant Measurements (TPM) tape.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|--|
| a | Type of tape to be written:
GEN — Generic
LIB — Library
NWM — Network Management
ODA — Office Data Assembler
TPM — Traffic and Plant Measurements |
| b | 1B file to write from:
NORM — Normal file.
UPD — Update file. |
| c | Number of tape files written. |
| d | Error code. Error codes are found in the output System Error Code Appendix APP:SYSERR. |

4. ACTION TO BE TAKEN

Format [1] is a normal response and indicates all-is-well.

For format [2], ensure that:

1. The correct tape unit is specified (MT 0 or MT 1).
2. The tape unit is in service.
3. The tape drive is online.
4. The tape has a write ring or write protect tab.

If any of the other formats are displayed or printed, seek technical assistance.

Format 2 indicates failing diagnostic results for an individual phase. This is the output if the diagnostic is output in the raw form.

3. VARIABLE FIELD DEFINITIONS

- a Member number of the API unit under diagnosis.
- b Termination mode for the diagnostic:
- COMPLETED — Diagnostic completed normally.
 - ABORTED — Diagnostic was abnormally stopped because of an interrupt or error in execution.
 - STOPPED — The diagnostic was terminated under program control since further testing would not improve resolution.
- c Results of the diagnostic:
- ATP — All tests passed.
 - CATP — All tests passed, however some tests were skipped because of the unavailability of a system resource which was needed to perform the test.
 - NTR — No tests were executed.
 - STF — Some tests failed.
- d The reason tests were skipped in this phase. The reasons are identified by their bit position in the 16-digit hexadecimal number that is printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

For example, if d = 00000000 00000006, tests were skipped for reasons 1 and 2. The reasons are as follows:

BIT REASON FOR TEST SKIPPED

0	Helper unit invalid or not specified
1	Helper unit cannot be reserved
2	Helper unit is not out of service
3	Helper control unit (CU) is not ATP
4-63	Unused

e	Test number of the failing test.
f	The bits that were in error. MISMATCH indicates that the response from the unit did not match the expected response in that bit.
g	N/A.
h	N/A.
i	N/A.

4. ACTION TO BE TAKEN

If c is CATP, restore the indicated system resource to service, if possible, so that all tests may be executed. If c is STF, repair the unit as quickly as possible. Otherwise, take no action.

2. REASON FOR OUTPUT

Each of the formats has a separate purpose.

Format 1 is used to report an error encountered by Control Unit (CU) diagnostic programs.

Format 2 is used to report a peripheral driver error encountered by the peripheral diagnostic programs.

Format 3 is used to report an error encountered by the peripheral diagnostic programs.

Format 4 is used to report a LEXEC function failure encountered by the peripheral diagnostic programs.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Diagnostic reporting the error;
- CU Control Unit
- DFC Disk File Controller
- IOP Input/Output Processor

If a = CU,

- b Reason for audit, in hexadecimal notation:
- 41 — Test count specified in phase end does not agree with test executed.
 - 42 — Off-line microcode execution timed out.
 - 43 — Off-line Main Store (MAS) execution set argument error.
 - 44 — Excofl time-out - the function LEXEC did not terminate as planned.
 - 45 — Micro code pump failed.
 - 46 — Illegal object file for (off-line) mainstore code execution.
 - 47 — Cannot load off-line mainstore.
 - 48 — Cannot set (off-line) register.
 - 49 — Cannot set up stack for (off-line) mainstore code.
 - 4A — (Off-line) Mainstore code execution problem.
 - 4B — Execute on-line failure.
 - 4C — Cannot open Equipment Configuration Database (ECD) manager / dev/ecd or / dev/dgn/ecd.
 - 4D — Illegal or unspecified helper unit requested.
 - 4E — ECD failed or is incorrect.
 - 4F — Psetup fail to pass topucb ptr to pcpmd driver.
 - 50 — Incorrect input parameters in interactive mode.
 - 51 — Getucb cannot get UCB named.
 - 52 — Getucb cannot reserve helper unit UCB.
 - 53 — Getucb cannot release helper unit UCB.
 - 54 — Getucb find UCB for helper unit.
 - 55 — Helper unit specified on the input request was invalid.
 - 56 — Operating system signal illegal instruction.
 - 57 — Operating system signal illegal bus error.
 - 58 — Operating system signal segment violation.
 - 59 — Operating system signal error on system call.
 - 61 — Diagnostic Control (DIAGC) process failed to open diagnostic driver.
 - 62 — Write to maintenance driver failed.
 - 63 — Normal completion of a phase.
 - 64 — Cannot open data table file.
 - 65 — Cannot share the DCB from DIAMON (connseg failed).
 - 66 — Error in data table.
 - 67 — Invalid number of parameters from DIAMON.
 - 68 — Open function failed, open tty device.
 - 69 — Cannot open dgn format file.
 - 6A — Invalid command received while in interactive mode.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6B — Cannot read (off-line) registers.
- 6C — Cannot open tlp file, -tlp option is denied.

If a = DFC or IOP,

- b Reason for audit, in hexadecimal notation.
 - 41 — Open special device file failed.
 - 42 — SETIO failed.
 - 43 — Makeseg failed.
 - 44 — Sendpw failed.
 - 45 — Read PC pump file failed.
 - 46 — Driver operation failed.
 - 47 — Open PC pump file failed.
 - 48 — Msgenab failure.
 - 49 — Msgdisab failure.
 - 4A — Open Processor Control Process Maintenance Driver (PCPMD) failed.
 - 4B — Write to PCPMD failed.
 - 4C — Excofl timed out.
 - 4D — Open ECD manager failed.
 - 4E — Function "ugucbn" failed.
 - 4F — PIC microstore size not in UCB.
 - 50 — Receive wait failed.
 - 51 — LEXEC function failed.
 - 52 — E_host of UCB not initialized.
 - 53 — Lseek function failure.
 - 54 — Drive size not 5 or 19 tracks.
 - 55 — Makeseg failed for disk read / write buffer.
 - 56 — Write/read segment too small.
 - 57 — Function ugetucb failed.
 - 58 — DFC not active.
 - 59 — IOP not active.
 - 64 — Cannot open data table file.
 - 65 — Cannot share DCB from DIAMON.
 - 66 — Error in the data table.
 - 67 — Invalid number of parameters from DIAMON.
 - 68 — Open spooler failed.
 - 6A — Invalid interactive mode command.
 - 6C — Open tlpfile failed.
 - 6D — Signal: illegal instruction.
 - 6E — Signal: bus error.
 - 6F — Signal: segment violation.
 - 70 — Signal: software termination.
- c Index into pcp table.
- d Central Control Input/Output (CCIO) bus simulator status register, in hexadecimal notation.
- e CCIO bus simulator error register, in hexadecimal notation.

SEE PROPRIETARY NOTICE ON COVER PAGE

f	Error number returned from PCPMD specified in decimal notation. See System Error Codes Output Appendix, APP:SYSERR.
g	Left half of instruction to PCPMD, in hexadecimal notation.
h	Right half of instruction to PCPMD, in hexadecimal notation.
i	Last test executed, in decimal notation.
j	Data table address, in hexadecimal notation.
k	Data table statement number, in decimal notation.
l	Task routine index, in hexadecimal notation.
m	Peripheral driver error code, in hexadecimal notation. DFC error codes are in Output Appendix APP:DFC-F. IOP error codes are in Output Appendix APP:IOP-F.
n	Error code returned on a failing system call or ECD function call: in decimal notation. See System Error Codes Output Appendix, APP:SYSERR.
o	Error code returned by LEXEC function call, in decimal notation. See System Error Codes Output Appendix, APP:SYSERR.
p	Error code from a PCPMD (the CU maintenance driver) function call, in decimal notation. See System Error Codes Output Appendix, APP:SYSERR.
q	CCIO bus driver error code, in hexadecimal notation.

4. ACTION TO BE TAKEN

If variable b is:

44, the off-line CU has failed to complete execution of a mainstore program. A hardware fault may exist in the off-line CU. Make sure that the Central Control (CC), Main Store Controller Unit (MASC), and Store Address Translator (SAT) diagnostics run all tests pass before proceeding with any troubleshooting.

4D, 50, 55, or 6A. refer to the Input Message and reenter the associated input command if

if any other value is printed. seek technical assistance.

TABLE (cont'd)

a Value Reason for Abort	b or h Value Supplemental Data
6F - Signal: segment violation.	See Output APP:APPENDIX-2
70 - Signal: software termination.	See Output APP:APPENDIX-2
71 - Open message switch failed.	Return code from _ims_open.
72 - ims_ioctl message switch failed.	Return code from _IMS_IOCTL.
73 - ims_write message switch failed.	Return code from _ims_write.
74 - ims_hdr message switch failed.	Return code from _ims_hdr.
75 - get_mbuf message switch failed.	Return code from _get_mbuf.
76 - ims_read message switch did not return _SUCCESS.	Return code from _ims_read.
77 - Timeout occurred. No reply message from message switch in event mode.	Has no significance.
78 - ucb name to node ID translation failed or data returned from ring_cnfg indicates more than DB_MAXNODE nodes in isolated segment.	0 - Bad node name to node ID translation. 1 - ring.cnfg indicates too many ring nodes.

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE (cont'd)

a Value Reason for Abort	b or h Value Supplemental Data
79 - Open driver for rpc diagnostics failed.	Return code from driver.
7A - Lock process in memory from dgndmawt() left insufficient memory for swapping.	Has no significance.
7B - Least significant byte in ucb HV field is out of range, ie, at least one nibble $\geq$ DBIFBMAX. (see db_arrays.h)	The NODE_ID corresponding to the ucb containing data that is out of range.
7C - Imsdiag timed out while awaiting a GO event from DIAMON.	Has no significance.
7D - The node being diagnosed is an iun type and is neither isolated nor does it have an RI minor state of USBL.	The nodes RI minor state. 0 - UNTSTD 1 - FLTY 2 - USBL 3 - QUSBL
7E - An excessive number of messages were queued for the _DIAGC channel immediately after the channel was opened.	Has no significance.
80 - Reply messages to rg_query() were received out of sequence.	Next expected sequence number.
81 - Argument passed to qktst_qu() was out of range. Allowable are 1(BISO) and 2(EISO).	Argument actually passed.

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE (cont'd)

a Value Reason for Abort	b or h Value Supplemental Data
82 - Request to update an RI minor state was not successful.	Node ID where update was not successful.
83 - An 8-byte message relayed from imsdia to itself via a double relay through the isolated segment was received from the proper relay node but the message was not the proper length.	Number of bytes in received message.
84 - Imsdiag received an unexpected node type from the driver in response to a node type query message.	Node type received: 128 - RPC Node. 0 - UNEQP node or unknown type.
85 - The driver rejected the diagnostic test job of the DLN dma.	The "result" field in the message returned from the driver: 4 - error found in request message. 8 - the software which handles the test DLN dma is busy.
86 - The message sequence number of the message for which the 2 bits pattern is going to be built exceeds the allowed limit.	Message sequence number of the message for which the 2 bits pattern is going to be built.
87 - The home RPC node ID for the home RPC of the relay node is not valid.	The home RPC node ID for the home RPC of the relay node.

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE (cont'd)

a Value Reason for Abort	b or h Value Supplemental Data
88 - The capacity test is aborted by the home RPC of the relay node.	The why_abt code in the reply message from the home RPC of the relay node for the diagnostic capacity test.
89 - The dg_rcont function was passed an invalid 'cntlcode' argument.	The actual 'cntlcode' argument passed to the dg_rcont() function.
90 - The dg_rcont function was passed an invalid 'racrst' argument.	The actual 'racrst' argument passed to the dg_rcont() function.
91 - The dg_rcont function was passed an invalid 'ring' argument.	The actual 'ring' argument passed to the dg_rcont() function.
92 - The dg_rcont function was passed an invalid 'wrtcode' argument.	The actual 'wrtcode' argument passed to the dg_rcont() function.
93 - The _nplspatch routine returned a failure code.	The return code from the call to _nplspatch.
94 - The reply message received by the pmppatch routine contained other than _SUCCESS in the 'status' field.	The value of the 'status' field in the pmppatch reply message.
95 - The reply message received by the pmppatch routine contained other than NPPH_RPY in the 'type' field.	The value of the 'type' field in the pmppatch reply message.
96 - IMS is undergoing system initialization.	The return value of the IMS driver function_it_what().

{MESSAGE IN PROGRESS|MSG IP}
- [3] DGN CU a [b] PH c STF ({e|f}) MSG IP
TEST MISMATCH ACTUAL MASK EXPECTED
g h [i|N/A] [j|N/A] [k|N/A]
- [4] DGN CU a [b] ABORTED AT PH c STMNT k d [({e|f})] MSG IP
- [5] DGN CU a [b] TERMINATED AT PH c STMNT l AFTER TEST m
- [6] DGN CU a [b] TASK n
{MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To report the result of executing a DGN:CU input message to diagnose the control unit, or one of its subunits.

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request cannot be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Member number (0 or 1).
- b Unit type and member number of the subunit under the CU; for example, CC 0, MASC 0, MASC 1, SAT 0, etc.
- c Phase number.
- d The result of the diagnostic:
ATP — All tests passed.
CATP — All tests were ATP; some were not executed due to the unavailability of a system resource needed to perform the test.
NTR — No tests were run.
STF — Some tests failed.
- e If the result of the diagnostic is CATP or NTR, identifies the reasons tests were skipped by their bit position in a 16-digit hexadecimal number. For example, (00000000 00000018), tests were skipped for reasons 3 and 4. Codes:
Bit 0 — Unused.
Bit 1 — Unit under test is forced on-line.
Bit 2 — Sanity timers are disabled.
Bit 3 — Emergency Action Interface (EAI) forces on CU, disk, sanity timer are active.
Bit 4 — Peripheral unit controller is out of service.
Bit 5 — Helper unit not specified or invalid.
Bit 6 — Helper unit unavailable.
Bit 7 — Unit under test is forced off-line.
Bit 8 — EAI initialization parameter buffer data pending; EAI must be cleared.
Bit 9 — Helper unit not connected to sub-unit under test.
Bits 10-63 — Unused.
- f If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000018), seven tests failed, plus tests were skipped for reasons 3 and 4. See previous list of codes.
- g Test number of the failing test.
- h The bits that were in error. A 1 in a bit position indicates the response from the unit did not match the expected response in that bit.
- i The bits that were actually received from the hardware device.
- N/A Data is not available for the specified device.
- j Determines which bits are included in this test.
- k The value which the test expected.
- l Last statement successfully executed before the diagnostic terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

m Current test number when diagnostic terminated.
n Task number assigned to the request.

4. ACTION TO BE TAKEN

If the result of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If the result of the diagnostic is STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance Procedures* manual for the repair procedures.

2. REASON FOR OUTPUT

To provide failure information when memory failures are detected by the Main Store Controller (MASC) diagnostic. The output contains detailed data on the first memory fault detected and histogram style summary data on all the faults in the sample, which is typically the first 100 faults detected. This information can be used to determine the faulty circuit pack and the faulty device on that circuit pack.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|--|
| a | Control unit (0 or 1). |
| b | Main store controller (0 or 1). |
| c | Phase number, in decimal notation. |
| d | Type of failing memory array. |
| e | Equipment Location (EQL) of the failing memory array, in decimal notation.
EQL equals distance from floor - distance from frame left. |
| f | Address of the first memory location to fail as a result of a mismatch between the expected memory contents and the actual memory contents or memory location under test when a mystore error became active (see address trapped indicator in n, in hexadecimal notation. |
| g | Data bit mismatch (bits 0-31) first failing memory location, in hexadecimal notation. |
| h | Actual data in memory, in hexadecimal notation. |
| i | Expected data (data that was written), in hexadecimal notation. |
| j | Parity bit mismatches in bits 31-24, and 2 error indicators in bits 23-22.

Bit 31 - H0.
Bit 30 - H1.
Bit 29 - H2.
Bit 28 - H3.
Bit 27 - PX.
Bit 26 - PY.
Bit 25 - PZ.
Bit 24 - PA.
Bit 23 - Multi-bit error is set when an error either
1) causes an address trap (TRAPPED ADDRESS REG bit 27 set) and an error C or D (bits 28 or 29 set) but the correctable parity failure (bit 0) is not set and the noncorrectable parity failure (bit 1) is set. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- 2) causes an address trap (bit 27 set) and error C or D active (bits 28 or 29 set) and the correctable parity failure (bit 0) is set, but more than one data and parity bits are mismatching.

Bit 22 - Logic error is set when an error either

- 1) does not cause an address trap (TRAPPED ADDRESS REG bit 27 not set) but there are data or parity mismatches.
- 2) causes an address trap (bit 27 set) but error C or D not active (bits 28 or 29 set).
- 3) causes an address trap (bit 27 set) and error C or D active (bit 28 or 29 not set) and correctable (single) bit error indicated (bit 0 set) but group failure bits (MAS ERROR REG 2 bits 6-0) contain a code not recognized as a single bit error.

- k Actual parity in memory, bits 31-24, same format as variable j.
- l Parity expected for the data written to memory in bits 31-24, same format as variable j.
- m Main store error register 2 after a read of the first failing memory location, in hexadecimal notation.

Bit 28 - HA parity group failure - (not available on UN39 type MASC).

Bit 23 - Trapped address bit 25 (UN618 type MASC). See main store trapped address error register.

Bit 21 - Trapped address parity byte 0 (UN59C and UN618 type MASC). See main store trapped address error register.

Bit 6 - PX parity group failure.

Bit 5 - PY parity group failure.

Bit 4 - PZ parity group failure.

Bit 3 - H0 parity group failure.

Bit 2 - H1 parity group failure.

Bit 1 - H2 parity group failure.

Bit 0 - H3 parity group failure.

- n Main store trapped address error register after a read of the first failing memory location, in hexadecimal notation. Trapped address parity for byte 0 (UN59C and UN618 type MASC) and trapped address bit 25 (UN618 type MASC) appear in main store error register 2.

Bit 31 - Trapped address bit 24 (UN59C type and UN618 type MASC).

Bit 30 - Trapped address bit 23 (not available on UN39 type MASC).

Bit 29 - Error C

Bit 28 - Error D

Bit 27 - Address trapped indicator.

Bit 23 - Read-write (1) or refresh (0) data parity error.

SEE PROPRIETARY NOTICE ON COVER PAGE

- Bit 1 - Noncorrectable parity failure.
Bit 0 - Correctable (single-bit) parity failure.
- o Main store error register after a read of the first failing memory location in hexadecimal notation.
- Bit 22 - Block store go error A.
Bit 11 - No row select on refresh error A.
Bit 10 - Row or column selects on maint op error A.
Bit 9 - Double half plane select row error A.
Bit 8 - Double half plane select column error A.
Bit 7 - Select row and column error A.
Bit 6 - Array address parity error A.
Bit 5 - Command bit parity error A.
Bit 4 - Busy clear F/F state error A.
Bit 3 - Latched normal address parity error A.
Bit 2 - Refresh address counter mismatch error A.
Bit 1 - Write data parity error A.
Bit 0 - Address loop - around F/F error A.
- p Central Control Error Register (CC ER) after a read of the first failing memory location or after a store error is detected, in hexadecimal notation.
- Usually the under test CU CC ER with byte parities in bits 31-28 from the failing address.
- For MASC phases 39, 41, and 96, the ACTIVE CU CC ER with byte parities in bits 31-28 from a read of the under test CU MASC at the failing address.
- q Number of failing locations for which histogram information was collected, in decimal notation. The upper limit is usually 100.
- r Number of addresses listed in r, in decimal notation.
- s List of the first q failing addresses, in hexadecimal notation.
- t Number of times the specified data bit (0-31) or parity bit (H0, H1, H2, H3, PX, PY, PZ, PA) was read as 0 when it was expected to be 1, in decimal notation.
- u Number of times the specified data or parity bit was read as 1 when it was expected to be 0, in decimal notation.
- v Number of times the address bit was 0 when a memory failure was detected, in decimal notation.
- w Number of times the address bit was 1 when a memory failure was detected, in decimal notation.

SEE PROPRIETARY NOTICE ON COVER PAGE

x	Number of times a multi-bit error occurred, in decimal notation. See explanation of item variable j, bit 23.
y	Number of times a logic error occurred, in decimal notation. See explanation of item variable j, bit 22.

4. ACTION TO BE TAKEN

Replace the memory array identified by the failing array information in the first fault data.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Dual Serial Channel/Computer Interconnect (DCI).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test. NTR — No tests were run. STF — Some tests failed.
c	If results of the diagnostic isf4CATP or NTR, identifies the reasons tests were skipped by their position in a 16-digit hexadecimal number. For example, (00000000 00000018), tests were skipped for reasons 3 and 4. Code: Bits 0 — 63 — Unused.
d	If results of the diagnostic is STF it identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, (00000000 00000006), tests were skipped for reasons 1 and 2. Code: Bits 0 — 63 — Unused.
e	Phase number.
f	Test number of the failing test.
g	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
h	The bits which were actually received from the hardware device.
N/A	Data is not available for the specified device.
i	Determines what bits in the actual value are of interest to this test.
j	The value which the test expected.
k	Last statement successfully executed before the diagnostic terminated.
l	Current test number when diagnostic terminated.
m	Task number assigned to the request.

4. ACTION TO BE TAKEN

If results of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If results of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to *Corrective Maintenance Procedures* for repair procedures.

SEE PROPRIETARY NOTICE ON COVER PAGE

THIS PROCESS SHOULD RUN NO LONGER THAN 15 MINUTES
AND MAY RUN ONLY A FEW SECONDS IF NO UPDATE IS REQUIRED
- [8] DGN DFC a - FLASH MEMORY UPDATE PROCESS COMPLETE

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Disk File Controller (DFC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

Format 7 indicates that the Flash update process has started, warning the user against stopping the diagnostic until the Flash update process has completed.

Format 8 indicates that the Flash update process has completed.

3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b The result of the diagnostic:
 - ATP — All tests passed.
 - CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
 - NTR — No tests were executed.
 - STF — Some tests failed.
- c If the results of the diagnostic is CATP or NTR, identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, (00000000 00000006), tests were skipped for reasons 3 and 4. Codes:
 - Bit 0 — Helper unit invalid or not specified.
 - Bit 1 — Helper unit cannot be reserved.
 - Bit 2 — Helper unit is not out-of-service.
 - Bit 3 — Helper Control Unit (CU) is not ATP.
 - Bit 4 — Helper unit not connected to controller being diagnosed.
 - Bits 5 — 63 - Unused.

NOTE: To interpret CATP bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first SBUS. The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first MHD beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit	Reason
32	— First MHD on first SBUS of DFC did not respond correctly.
33	— Second MHD on first SBUS of DFC did not respond correctly.
34	— Third MHD on first SBUS of DFC did not respond correctly.
35	— Fourth MHD on first SBUS of DFC did not respond correctly.
36	— Reserved for fifth MHD on first SBUS of DFC.
37	— Reserved for sixth MHD on first SBUS of DFC.
38	— Reserved for seventh MHD on first SBUS of DFC.
40	— First MHD on second SBUS of DFC did not respond correctly.
41	— Second MHD on second SBUS of DFC did not respond correctly.
42	— Third MHD on second SBUS of DFC did not respond correctly.
43	— Fourth MHD on second SBUS of DFC did not respond correctly.
44	— Reserved for fifth MHD on second SBUS of DFC.
45	— Reserved for sixth MHD on second SBUS of DFC.
46	— Reserved for seventh MHD on second SBUS of DFC.
d	If the results of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. See previous list of codes.
e	Phase number.
f	Test number of the failing test.
g	The bits that were in error. A '1' in a bit position indicates that the response from the unit did not match the expected response in that bit.
h	The bits which were actually received from the hardware device.
N/A	Data is not available for the specified device.
i	Determines what bits in the actual value are of interest to this test.
j	The value which the test expected.
k	Last statement successfully executed before the diagnostic terminated.
l	Current test number when diagnostic terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

m Task number assigned to the request.

4. ACTION TO BE TAKEN

If the results of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If the results of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to the *Corrective Maintenance Procedures* manual for repair procedures.

WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,IMS
TYPE Output

1. FORMAT

This message has two output formats:

- [1] DGN LN_x y b c [d]

[2] DGN LN_x y PH b c [d]
TEST MISMATCH
e f

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a Link Node (LN).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 is printed whenever the diagnostic results are printed for an individual phase. This occurs in the case of partial diagnosis, a test failure, or whenever RAW was specified in the input message.

3. VARIABLE FIELD DEFINITIONS

In Format 1:

- x A Ring Node (RN) group number (00-63).
y The ring node member number (1-15).
b Termination mode of diagnostic.
COMPLETED — Diagnostic completed normally.
TERMINATED — Diagnostic terminated under program control (early termination), since further testing would not improve diagnostic resolution.
ABORTED — Diagnostic was abnormally stopped due to an external or internal error in execution, or a STOP:DMQ input request.

c Result of the diagnostic.
ATP — All tests passed
CATP — All tests that were executed were ATP. Some tests were not executed due to reasons identified by item d.
NTR — No tests run.
STF — Some tests failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

If c = CATP or NTR

d Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if d = 00000000 80000000, tests were skipped for reason 31. The reason codes are as follows:

- Bits 0 to 22 — Not used.
- Bit 23 — The equipage field of the UCB for the LID0 equipped node indicates a link interface connection is not equipped.
- Bit 24 — Not used.
- Bit 25 — The phase was not run because the UCB indicates that the node is not equipped with an EMSB (Enhanced Message Sampling Board).
- Bit 26 — Could not get the RPCD UCB for the RPCD - DLN UCB pair at a DLN.
- Bit 27 — Smart node memory board is not equipped.
- Bit 28 — Attached Processor state variable indicates that this phase need not be run.
- Bit 29 — Node under test is neither isolated nor in the RIUSBL minor state.
- Bit 30 — Node under test was not the only isolated node.
- Bit 31 — Node under test was not isolated.
- Bits 32 to 63 — Not used.

If c = STF

d Number of test failures in addition to the reasons that tests were skipped. For example, if d = 7 00000000 80000000, seven tests failed, plus tests were skipped for reason 31.

In Format 2:

- x A Ring Node (RN) group number (00-63).
- y The ring node member number (1-15).
- b Phase number.
- c Result of the phase.
 - ATP — All tests passed
 - CATP — All tests that were executed were ATP. Some tests were not executed due to reasons identified by item d.
 - NTR — No tests run.
 - STF — Some tests failed.

If c = STF

d Identifies the reason that some tests were skipped. This field is the same as the d field in Format 1 except that the result of only one phase is reflected.

SEE PROPRIETARY NOTICE ON COVER PAGE

- | | |
|---|--|
| e | Test number of the failing test. |
| f | An 8-digit hexadecimal number that indicates the bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit. |

4. ACTION TO BE TAKEN

If c = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If c = STF, the unit should be repaired as quickly as possible.

- [6] DGN MHD a PH 6 DISK READ/WRITE FAILURES
ERROR CODE JOB TYPE SECTOR HEAD
l m n o
- [7] DGN MHD a TASK p {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Moving Head Disk (MHD).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input message.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6, a histogram-type printout of disk read/write test failures, is printed if MHD phase 6 fails the read/write tests.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were executed. STF — Some tests failed.
c	If the results of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000000), seven tests failed, and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines what bits in the actual value are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Error code, in hexadecimal notation: 02 — disk read data all zeros 04 — disk read data mismatch 08 — disk read parity mismatch For other error codes, see DFC Output Appendix B APP:DFC-B.
m	Numeric code for the job in progress at the time of the error: 1 — maintenance sector write worst case data 2 — maintenance sector read worst case data 3 — maintenance sector write inverted worst case data 4 — maintenance sector read inverted worst case data 5 — maintenance sector ECC test write 6 — maintenance sector ECC test read 41 — head selection error for maintenance sector write worst case data 42 — head selection error for maintenance sector read worst case data

SEE PROPRIETARY NOTICE ON COVER PAGE

- 43 — head selection error for maintenance sector write inverted worst case data
- 44 — head selection error for maintenance sector read inverted worst data case
- 45 — head selection error for maintenance sector ECC test write
- 46 — head selection error for maintenance sector ECC test read
- 81 — seek error for maintenance sector write worst case data
- 82 — seek error for maintenance sector read worst case data
- 83 — seek error for maintenance sector write inverted worst case data
- 84 — seek error for maintenance sector read inverted worst case data
- 85 — seek error for maintenance sector ECC test write
- 86 — seek error for maintenance sector ECC test read

n Sector number where the error occurred.

o Head number where the error occurred.

p Task number assigned to the request.

4. ACTION TO BE TAKEN

For Formats 1 and 5, take no action.

For Formats 2, 3, and 4, if the results of the diagnostic is STF, the unit should be repaired as quickly as possible. See the *Lucent Technologies 3B20D/3B21D Model 2 and Model 3 Computers - Common Systems, Routine Tasks* manual for repair procedures.

For Format 6, repair the unit as quickly as possible. Refer to the *Lucent Technologies 3B20D/3B21D Model 2 Computer - Common Systems, Trouble Clearing* manual for repair procedures.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Magnetic Tape (MT).

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was stopped due to an external or internal error in execution, or an input message.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were executed. STF — Some tests failed.
c	If the results of the diagnostic is STF it identifies the number of test failures in addition to the number of tests skipped. For example, (7 00000000 00000000), seven tests failed, and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines what bits in the actual value are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Task number assigned to the request.

4. ACTION TO BE TAKEN

For Formats 1 and 5, no action is needed.

For Formats 2, 3, and 4, if the results of the diagnostic is STF, the unit should be repaired as quickly as possible; seek technical assistance.

For Format 6, repair the unit as quickly as possible; seek technical assistance.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Magnetic Tape Controller (MTC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b The result of the diagnostic:
- ATP — All tests passed.
 - CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
 - NTR — No tests were run.
 - STF — Some tests failed.
- c If the results of the diagnostic is CATP or NTR, identifies the reasons tests were skipped by their position in a 16-digit hexadecimal number. For example, (00000000 00000018), tests were skipped for reasons 3 and 4. Codes:
- Bit 0 — Helper unit not specified or invalid.
 - Bit 1 — Helper unit cannot be reserved.
 - Bit 2 — Helper unit not out-of-service.
 - Bit 3 — Helper unit is not ATP.
 - Bit 4 — Helper unit not connected to controller being tested.
 - Bit 17 — Helper MT tape not mounted and/or transport door open.
 - Bit 18 — Helper MT transport not in "on-line" mode.
 - Bit 19 — Helper MT tape reel has no Write Enable Ring (WER).
 - Bit 20 — Helper MT tape too long for diagnostic test tape.
 - Bit 21 — Helper MT tape has no header block at BOT or header block indicates not diagnostic test tape.
- d If the results of the diagnostic is STF it identifies the reasons tests failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. See previous list of codes.
- e Phase number.
- f Test number of the failing test.
- g The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
- h The bits which were actually received from the hardware device.
- N/A Data not available for the specified hardware device.
- i Determines what bits in the actual value are of interest to this test.
- j The value which the test expected.
- k Last statement successfully executed before the diagnostic terminated.
- l Current test number when diagnostic terminated.
- m Task number assigned to the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the results of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If the results of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to TOP 235-105-220 for the repair procedures.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Maintenance Teletypewriter Controller (MTTYC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

Format 7 indicates that the Flash update process has started, warning the user against stopping the diagnostic until the Flash update process has completed.

Format 8 indicates that the Flash update process has completed.

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were run. STF — Some tests failed.
c	If the results of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000000), seven tests failed, and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines what bits in the actual value are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if the results of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for the repair procedures.

APPLICATION .. 4E,IMS
TYPE Output

1. FORMAT

[1] DGN RPCNx 0 b c [d]

[2] DGN RPCNx 0 PH b c [d]
TEST MISMATCH
e f

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a Ring Peripheral Controller Node (RPCN).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 is printed whenever the diagnostic results are printed for an individual phase. This occurs in the case of partial diagnosis, a test failure, or whenever RAW was specified in the input message.

3. VARIABLE FIELD DEFINITIONS

In Format 1:

x A Ring Node (RN) group number (00-63) with explicit leading zero for group numbers less than 10.

b Termination mode of diagnostic.

COMPLETED — Diagnostic completed normally.
TERMINATED — Diagnostic terminated under program control (early termination), since further testing would not improve diagnostic resolution.
ABORTED — Diagnostic was abnormally stopped due to an external or internal error in execution, or a STOP:DMQ input request.

c Result of the diagnostic.

ATP — All tests passed.
CATP — All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singly isolate, the node under test.
NTR — No tests run.
STF — Some tests failed.

if c = CATP or NTR

SEE PROPRIETARY NOTICE ON COVER PAGE

d Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if d = 00000000 00000006, tests were skipped for reasons 1 and 2. The reason codes are as follows:

- Bit 0 — Helper unit invalid or not specified.
- Bit 1 — Helper unit cannot be reserved.
- Bit 2 — Helper unit not out-of- service.
- Bit 3 — Helper CU is not ATP.
- Bits 4 to 29 — Unused.
- Bit 30 — Node under test was not the only isolated node.
- Bit 31 — Node under test was not isolated.
- Bits 32 to 63 — Unused.

If c = STF

d Number of test failures in addition to the reasons that tests were skipped. For example, if d = 7 00000000 00000006, seven tests failed, plus tests were skipped for reasons 1 and 2.

In Format 2:

x A Ring Node (RN) group number (00-63) with explicit leading zero for group numbers less than 10.

b Phase number.

c Result of the phase.

- ATP — All tests passed
- CATP — All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singly isolate, the node under test.
- NTR — No tests run.
- STF — Some tests failed.

If c = STF

d Identifies the reason that some tests were skipped. This field is the same as the d field in Format 1 except that the result of only one phase is reflected.

e Test number of the failing test.

f An 8-digit hexadecimal number that indicates the bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.

4. ACTION TO BE TAKEN

If c = CATP, the needed system resource should be made available if possible, so that all tests may be executed. If c = STF, the unit should be repaired as quickly as possible.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Scanner And Signal Distributor Controller (SCSDC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were run. STF — Some tests failed.
c	If the results of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000000), seven tests failed, and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines what bits in the actual value are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Task number assigned to the request.

4. ACTION TO BE TAKEN

If the results of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for repair procedures.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Synchronous Datalink Controller (SDLC).

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

[1] DUMP ADDR a [OFF b] COMPLETED #c
ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
d e

[2] DUMP ADDR a [OFF b] STOPPED NGADDR #c

2. REASON FOR OUTPUT

To report the result of executing the DUMP:ADDR input message to dump out the contents of an address or address range in main memory.

Format 2 indicates an error was encountered in the indirection addressing chain.

3. VARIABLE FIELD DEFINITIONS

a Virtual address specified in input message.
b Offset(s) used on input message line.
c Generic Access Package (GRASP) execution sequence number.
d Address label for line of data.
e Data as dumped from memory.

4. ACTION TO BE TAKEN

If Format 2 is printed, recheck the program listings. If an indirection chain was specified, try breaking the chain into several parts and printing the intermediate addresses.

5. REFERENCES

SESSION VOLUME NAME BLOCKS SOURCE DATE
g h i {j|NAV} {k|NAV} {l|NAV}
- [4] DUMP BKTAPE TD a IN PROGRESS
[CUMULATIVE BLOCKS m]

2. REASON FOR OUTPUT

To display logical volume information for the multi-volume Digital Audio Tape (DAT) loaded in the user-specified tape drive. The logical volume information consists of the backup session number, logical volume number, logical volume name, size, source disk, and date written. The logical volume information will be displayed as a result of executing either the DUMP:BKTAPE command or the DUMP:BKTAPE command poke on the DFC

SEE PROPRIETARY NOTICE ON COVER PAGE

Status Page. If the command was invoked via a command poke, a REPT:DKDIP message will precede the output message.

3. VARIABLE FIELD DEFINITIONS

- a Pathname of the tape special device file.
- b Request status:
- ABORTED — The dump failed and aborted .
 - COMPLETED — The dump completed with no errors.
 - IN PROGRESS — The dump is processing logical volume headers.
 - STARTED — The dump started processing logical volume headers.
 - STOPPED — The dump failed and stopped.
- c Error code output by the DUMP:BKTAPE command poke on the DFC Status Page:
- f01 — Failed to get ECD information for tape device.
 - f05 — Special device file is not for a DAT.
 - f09 — Tape device is not active.
 - f0d — Failed to allocate data buffer.
 - f11 — Invalid buffer address.
 - f15 — entry() call failed.
 - f19 — Failed to rewind tape.
 - f1d — Failed to open no-rewind tape device.
 - f21 — Failed to get tape header information.
 - f25 — Failed to close no-rewind tape device.
 - f29 — Failed to rewind tape.
 - f2d — Failed to get ECD logdev record for tape special device file.
 - f31 — Failed to get mdct record for tape special device file.
 - f35 — Invalid partition value for tape special device file.
 - f39 — Failed to get ucb record for tape device.
 - f3d — Failed to get tape device driver PID.
 - f41 — Failed to open rewind tape device.
 - f45 — Failed to close rewind tape device.
 - f49 — send_rcv() call failed.
 - f4d — Failed to open tape device.
 - f51 — send_rcv() call failed.
 - f55 — Failed to close tape device.
 - f59 — send_rcv() call failed.
 - f5d — Tape header read failed.
 - f61 — Invalid multi-volume tape.
 - f65 — Tape header read failed.
 - f69 — Tape header contains invalid session number.
 - f6d — Tape header contains invalid volume number.
 - f71 — Invalid multi-volume tape.
 - f75 — Sessions are not sequential.
 - f79 — Volumes are not in ascending order.
 - f7d — ioqueue() call failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

	f81 — <code>tio_ack()</code> call failed.
	f85 — Tape I/O message timed out.
d	System error code number (see the System Error Codes Output Appendix, APP:SYSERR).
e	Internal error code for failure of an Equipment Configuration Database (ECD) access function: 1 — <code>getdbseg()</code> failed, could not attach to the ECD. 2 — <code>lla_iatt()</code> failed, could not attach to the incore database. 3 — <code>lla_rdget()</code> failed, could not get the <code>ecdorg</code> record from the ECD. 4 — <code>lla_get()</code> failed, could not get the <code>logdev</code> record from the ECD. 5 — <code>lla_rdget()</code> failed, could not get the <code>mdct</code> record from the ECD. 6 — <code>lla_rdget()</code> failed, could not get the <code>ucb</code> record from the ECD. 10 — <code>rmovdbseg()</code> failed, could not remove incore database segments.
f	Error code returned by a failed tape library function (see the Tape Library Error Appendix, APP:TAPE-LIB).
g	Session number (1-9).
h	Logical volume number (0-9).
i	Logical volume name, AMTEXT, AMODD, SMTEXT, SMODD1, SMODD2, SMODD3, SMODD4, SMODD5, SMODD6, TOP
j	Size, in 512 byte blocks, of the logical volume.
NAV	Not Available (NAV) is output if the logical volume is a TOP volume.
k	Name of the source disk(s).
l	Date (mm/dd/yy) on which the logical volume was written.
m	Total size, in 512 byte blocks, of the data on the DAT. The total size does not include the TOP volume.
n	Length, in meters, of the DAT.
o	Estimated percentage of the DAT that is being used.

4. ACTION TO BE TAKEN

Errors will be accompanied by explanatory text or an error code. Verify that the command that was input is consistent with the DUMP:BKTAPE input message. If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

DUMP BWM MSG COMPLETED

[3] DUMP BWM ERROR - COULD NOT CREATE c

[4] DUMP BWM ERROR - COULD NOT OPEN c FOR WRITING

[5] DUMP BWM ERROR - COULD NOT OPEN c FOR READING

[6] DUMP BWM ERROR - COULD NOT SEEK INTO c

[7] DUMP BWM ERROR - COULD NOT WRITE TO c

[8] DUMP BWM ERROR - COULD NOT READ FROM c

[9] DUMP BWM ERROR - COULD NOT STAT c

2. REASON FOR OUTPUT

To report the result of executing a DUMP:BWM command.

3. VARIABLE FIELD DEFINITIONS

a BWM number applied to the 3B APS.
b Date and time of BWM application.

SEE PROPRIETARY NOTICE ON COVER PAGE

c Path name of the file that caused the error to print.

4. ACTION TO BE TAKEN

Formats 1 and 2 are normal output messages and no action is required.

Formats 3 through 9 indicate that there was a problem while performing an operation to a file. Re-execute the command. If errors persist, seek technical assistance.

5. REFERENCES

Input Message
DUMP : BWM

SEE PROPRIETARY NOTICE ON COVER PAGE

ID DUMP:CACHE
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] DUMP CACHE a b
- [2] DUMP CACHE NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS c

2. REASON FOR OUTPUT

To report the status of a request to dump the contents of cache in the off-line processor.

3. VARIABLE FIELD DEFINITIONS

- a Request status:
- COMPLETED — The off-line cache was dumped successfully.
- STOPPED — The cache dump could not be completed because of an error.
- b Reason the cache dump was stopped:
- 1 — Processor Control Process Maintenance Driver (PCPMD) could not open physical memory (/dev/pmem).
 - 2 — PCPMD could not set the position of the input stream after opening physical memory.
 - 3 — PCPMD reached an End Of File (EOF) when it tried to search for information located in physical memory.
 - 4 — PCPMD encountered an error in reading the contents of physical memory.
 - 5 — PCPMD could not set the contents of a register in the off-line processor.
 - 6 — PCPMD failed when it tried to copy data to the memory of the off-line processor.
 - 7 — PCMPD could not execute a program in the off-line processor.
 - 8 — The DUMP:CACHE message could not reserve the Unit Control Block (UCB) of the off-line processor.
- c Could not access or reserve the UCB record of the mate CU, or the mate CU was not out-of-service.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the reason the cache dump was stopped is 1 - 4, the indication is that a software error occurred. Collect all relevant Receive-Only Printer (ROP) data and seek technical assistance.

If the reason the cache dump was stopped is 5 - 7, the problem is most likely with the maintenance channel or the off-line processor. Diagnose the off-line processor.

If the reason the cache dump was stopped is 8, make sure that another process does not have control of the off-line processor (that is, diagnostics or a CU restore) since these reserve the off-line processor's UCB. If it appears that a diagnostic or CU restore was in progress, wait for its completion and try again. If the message still fails in the same manner, seek technical assistance.

1. FORMAT

- [1] DUMP FILE ALL {STARTED | IN PROGRESS | COMPLETED}
a
- [2] DUMP FILE ALL STOPPED
b

2. REASON FOR OUTPUT

To report the result of executing a DUMP:F;ALL input command to dump the contents of an ASCII file.

Format 1 indicates successful execution of the command.

Format 2 indicates failure.

NOTE: STARTED, IN PROGRESS, and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

- a Contents of the file.
- b Text explaining why the command was stopped.

4. ACTION TO BE TAKEN

Format 1 indicates success. No action is required.

If Format 2 is printed, refer to the input message for the correct command format, and correct any command line errors. If the explanatory text indicates that the file cannot be accessed, verify the file's existence using the OP:ST-LISTDIR command. If the text is not self-explanatory, seek technical assistance.

APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] DUMP FILE FORMAT {STARTED | IN PROGRESS | COMPLETED}
a
- [2] DUMP FILE FORMAT STOPPED
b

2. REASON FOR OUTPUT

To report the execution of a DUMP:FILE;FORMAT input message to dump the contents of a file.

Format 1 indicates successful execution of the command.

Format 2 indicates failure.

NOTE: STARTED, IN PROGRESS, and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

- a Contents of the file in ASCII, decimal, octal, or hexadecimal notation.
Default = octal notation. If the dump is in ASCII notation, the special
symbols are used to express nongraphic characters:
- \ 0 — null
 - \ b — backspace
 - \ f — form-feed
 - \ n — new-line
 - \ r — return
 - \ t — tab
- Other nongraphic characters appear as three-digit octal numbers.
- b Pathname specified in the input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Format 1 indicates success; no action needed.

For Format 2, refer to the input message for the correct command format, and correct any command line errors. If the explanatory text indicates that the file cannot be accessed, verify the file's existence using the OP:ST-LSTDIR input message. If the text is not self-explanatory, seek technical assistance.

TYPE Output

1. FORMAT

[1] DUMP KERN a [OFF b] #e
ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
c d

[2] DUMP KERN a [OFF b] STOPPED NGADDR #e

2. REASON FOR OUTPUT

To report the result of executing a DUMP:KERN input message to dump out the contents of an address or address range in the kernel.

Format 2 indicates the address specified is not valid for the process, or invalid address values were encountered in the address chain if offsets were used.

3. VARIABLE FIELD DEFINITIONS

a Virtual address specified in input message.
b Offset(s) used on input command line.
c Address label for line of data.
d Data as dumped from memory.
e Generic Access Package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If Format 2 is printed, recheck the program listings. If an indirection chain was specified, try breaking the chain into several parts and printing the intermediate addresses.

- [5] DUMP MHD a BLOCK ERROR d e
- [6] DUMP MHD a BLOCK ABORTED d
- [7] DUMP MHD a BLOCK ABORTED d
ERROR DATA f g h i j

2. REASON FOR OUTPUT

To report the status of a request to display the contents of a disk block.

Format 7 provides additional error information when an explicit SCSI command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

- a Moving Head Disk (MHD) member number.
- b Identifies the disk block that is being dumped.
- c Data contained in the specified disk block. Printed in row major order, hexadecimal notation.
- d Process step or reason code:
 - f03 — failed to open ECD
 - f06 — failed to get UCB by name
 - f08 — failed to get UCB of controlling unit
 - f0a — controlling unit is not active
 - f12 — failed to reserve UCB
 - f15 — failed to assign special device file name
 - f18 — failed to open special device file
 - f20 — failed to set I/O mode of device file
 - f21 — failed to enable message reception

SEE PROPRIETARY NOTICE ON COVER PAGE

 - f23 — ending disk block exceeds disk boundary
 - f24 — failed to fopen() output file
 - f25 — fseek() failed on output file
 - f27 — lseek() to start block failed
 - f30 — disk read failed
 - f33 — process timed out
 - f36 — failed to close special device file
 - f39 — failed to release special device file
 - f42 — failed to unreserve UCB
 - f45 — failed to close ECD
 - f48 — terminated externally with signal
 - f50 — diskinfo() library call failed
 - f53 — lseek() to "comb" defect table failed
 - f56 — read of "comb" defect table failed
 - f60 — failed to get the segment number
 - f63 — see DKDRV report on the ROP
 - f69 — SCSI "read capacity" command failed
 - f70 — message to port failure
 - f73 — message reception failure
- e System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- f Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.
- AAAA = SCSI Job Block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, APP:DFC-K.
 - BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, APP:DFC-K.
 - CC = Fill. Not used.
- g First word of Extended Sense Data (ESD). See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 0 of ESD.
 - BB = Byte 1 of ESD.
 - CC = Byte 2 of ESD.
 - DD = Byte 3 of ESD.
- h Second word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 4 of ESD.
 - BB = Byte 5 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CC = Byte 6 of ESD.
- DD = Byte 7 of ESD.
- i Third word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 8 of ESD.
- BB = Byte 9 of ESD.
- CC = Byte 10 of ESD.
- DD = Byte 11 of ESD.
- j Fourth word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 12 of ESD.
- BB = Byte 13 of ESD.
- CC = Byte 14 of ESD.
- DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports which provide an error code usually indicate that a system resource was not available or became unavailable to perform the task. Clear the problem causing the resource limitation and retry the input request.

In some instances, other UNIX® RTR error messages may be printed which may provide information pertaining to the failure encountered.

If Format 7 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

ERROR DATA o p q r s
- [5] DUMP MHD a DEFECT TABLE COMPLETED
SCSI DEFECT COUNT CHECK ABORTED c
ERROR DATA o p q r s

2. REASON FOR OUTPUT

To report the results of executing a DUMP:MHD;DEFECT input message, from either the DUMP:MHD;DEFECT command or from the DUMP:DEFECT poke on the DFSA display page. If the command was invoked via the poke, a REPT:DKDIP message will precede the output message.

The output data represents defect management information pertaining to the specified Moving Head Disk (MHD). For a Small Computer System Interface (SCSI) MHD, the GROWN defect list is output as the COMBINED defect table. Similarly, the PRIMARY defect list is output as the MANUFACTURER'S defect table.

Formats 4 and 5 provide additional error information when an explicit SCSI command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

- a MHD member number.
- b Message status:
- ABORTED
- ERROR
- IN PROGRESS
- NOT STARTED
- STARTED
- STOPPED
- c Process step or reason code:
- f03 — failed to fopen() /tmp file
- f05 — fseek() failed on the output file
- f08 — failed to fopen() specfile
- f0b — failed to open the ECD
- f0d — failed to get UCB by name
- f0e — failed to get top UCB

SEE PROPRIETARY NOTICE ON COVER PAGE

- fc9 — diskinfo() library call failed
fcb — unknown defect limit type
fce — unexpected UCB equipage value
ffe — aborted due to phase 1
- d System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- e Number of defects on the disk drive up to the recommended limit.
- For a SCSI disk drive, the total number of defects in the table could exceed the recommended limit. However, no more than the recommended limit of defects will be displayed.
- f Total number of defects in "combined" defect table.
- g Maximum number of defects allowed. This variable field only applies for SMD disk drives.
- h Cylinder number of defect.
- i Head number of defect.
- j Type of defect:
M — Manufacturer specified.
N — New; found by DFC.
- k If type of defect is new, this is the number of tests failed.
- l If type of defect is new, this is the number of tests run.
- m Sector number of defect.
- n Number of newly-found but not yet tested defects.
- o Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.
- AAAA = SCSI Job Block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, APP:DFC-K.
- BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, APP:DFC-K.
- CC = Fill. Not used.
- p First word of Extended Sense Data (ESD). See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABCCDD.
- AA = Byte 0 of ESD.
- BB = Byte 1 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CC = Byte 2 of ESD.
- DD = Byte 3 of ESD.
- q Second word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 4 of ESD.
- BB = Byte 5 of ESD.
- CC = Byte 6 of ESD.
- DD = Byte 7 of ESD.
- r Third word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 8 of ESD.
- BB = Byte 9 of ESD.
- CC = Byte 10 of ESD.
- DD = Byte 11 of ESD.
- s Fourth word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 12 of ESD.
- BB = Byte 13 of ESD.
- CC = Byte 14 of ESD.
- DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and input the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk:

The number of GROWN defects on a disk drive should not exceed the recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a disk drive should not exceed the recommended limit. If the recommended limit is exceeded, the disk drive could become unreliable.

SEE PROPRIETARY NOTICE ON COVER PAGE

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the recommended limit is exceeded, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the system.

Lucent Technologies recommends that the SCSI disk drive should be replaced if there is any warning output related to the recommendations.

If Formats 4 and 5 print, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID DUMP:PID
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

[1] DUMP PID a ADDR b [OFF c] COMPLETED #
ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
d e

[2] DUMP PID a ADDR b [OFF c] f #g

2. REASON FOR OUTPUT

To report the result of executing the DUMP:PID input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

- a Process ID of the target process.
- b Virtual address specified in input message.
- c Offset(s) used on input command line.
- d Address label for line of data.
- e Data as dumped from memory.
- f Termination status:
- NOT STARTED NGPID — The DUMP was stopped because the specified process does not exist.
- STOPPED NGADDR — The DUMP was stopped because the address specified is not valid for the process; or invalid address values were encountered in the address chain, if offsets were specified.
- g Generic Access Package (GRASP) execution sequence number.

4. ACTION TO BE TAKEN

If the termination status is NOT STARTED NGPID, the process did not exist at the time the DUMP was attempted. If this happens repeatedly with the process IDs used because the process has a short lifetime, consider using the process Utility Identification (UID) instead of Process Identification (PID).

If the termination status is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses. Another possibility is to define a breakpoint for that process and use the DUMP message in the action list.

WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

[1] DUMP RNA a b INACCESSIBLE ERRNO = c

[2] DUMP RNA a b COMPLETED

ADDRESS(X'):	CONTENTS OF MEMORY (X')
[e: f f f f]	
.	

2. REASON FOR OUTPUT

To report the result of executing the DUMP:RNA input message to dump out the contents of an address or address range from a node on the ring.

Format [1] indicates the error case; either the 3B could not communicate with the node (the node was OOS or nonexistent) or the input request could not be done.

Format [2] is the output format for a successful dump, giving the data requested. All data dumped is dumped in 3B word layout, with the most significant byte on the left. This is opposite the output that OP:NPMEM gives, which is in 8086 word layout.

DUMP RNA	OP NPMEM
bytes ABCD	bytes DCBA

3. VARIABLE FIELD DEFINITIONS

- a Ring Node Address (RNA) of the node that was dumped.
- b Type of node memory to be dumped:
- AP — Attached processor physical memory.
 - APACI — Attached processor ACI translation memory.
 - APPDB — Attached processor APPDB translation memory.
 - NP — Node processor physical memory.
- c Error number indicating the reason the dump could not be done:
- 3 — ESRCH — Internal error - no such process or CDP driver in unknown state.
 - 5 — EIO — Internal error - cannot lock or unlock data segment for DMA to/from ring.
 - 6 — ENXIO — Unknown error.
 - 7 — E2BIG — Internal error. Driver CDP set up with incorrect number of arguments.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 14 — EFAULT — Bad address - out of range.
- 19 — ENODEV — No such node (BAD RNA) or node OOS.
- 22 — EINVAL — Invalid size request.
- 23 — ENFILE — Internal error. Temporary mknod set up with bad partition number.
- 44 — EFUNC — Invalid request type.

- d Address label for line of data.
- e Data as dumped from memory.

4. ACTION TO BE TAKEN

If Format [1] occurs, determine the reason the output could not be made. Verify the hardware state of node using either OP:NODES or the 1105-1108 display pages. The DUMP:RNA command only works if the node is in the IMS hardware (ECD) ACT state. If the node is ACT, then reverify the address to be dumped. Only the legal physical address range of the node may be dumped.

[7]      DUMP RUTIL COMPL

```

Formats 5, 6, and 7 indicate successful `DUMP-RUTIL` outputs.

Issue 9.4
September 2001

3. VARIABLE FIELD DEFINITIONS

a	The invalid length provided by user.
b	The value of the global variable errno.
c	The return code from the RGRASP kernel.
ddd	The node identifier of the concerned node.
eeeeeeee	Address in hexadecimal of data being dumped.
ffffffff	Contents in hexadecimal of data being dumped.

4. ACTION TO BE TAKEN

Seek technical assistance on error conditions.

[4] DUMP SCP ERROR - COULD NOT OPEN h FOR WRITING

[5] DUMP SCP ERROR - COULD NOT OPEN h FOR READING

[6] DUMP SCP ERROR - COULD NOT SEEK INTO h

[7] DUMP SCP ERROR - COULD NOT WRITE TO h

[8] DUMP SCP ERROR - COULD NOT READ FROM h

[9] DUMP SCP ERROR - COULD NOT STAT h

[10] DUMP SCP ERROR - CAN'T DETERMINE GENERIC FOR h

SEE PROPRIETARY NOTICE ON COVER PAGE

[11] DUMP SCP ERROR - FEATURE IS NOT ENABLED FOR 4Ei

2. REASON FOR OUTPUT

To report the result of executing a DUMP :SCP command.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|---|
| a | Either NORMAL for 1B normal file or UPDATE for 1B update file. |
| b | Path name of the 1B normal or update file. |
| c | The generic version of the selected 1B file. |
| d | BIG GULP level applied to the selected 1B disk file. |
| e | Date and time the BIG GULP was detected in the selected 1B disk file. |
| f | Software Change Package (SCP) number. |
| g | Date and time the SCP was detected in the selected 1B disk file or value of "*** NO-TRACK ***". See Action To Be Taken section. |
| h | Path name of the file that caused the error to print. |
| i | Selected 1B generic that does not have this feature enabled. |

4. ACTION TO BE TAKEN

Formats 1 and 2 are normal output messages and no action is required unless "*** NO-TRACK ***" appears in the output. In this case, the 3B data file indicates that the SCP tracking was lost from the selected 1B file. Verify if the SCP listed should be in the selected 1B disk file. If the SCP should exist, contact technical support to correct the problem. If the SCP is not valid, execute the correction option on the input command.

Formats 3 through 10 indicate that there was a problem while performing an operation to a file. Re-execute the command. If errors persist, seek technical assistance.

Format 11 indicates that this feature is not available for the selected 1B disk file generic.

- [8] DUMP SMEAS ABT
i
- [9] DUMP SMEAS COMPL
Periodic Data Collection in Progress. Request denied.

2. REASON FOR OUTPUT

Prints in response to the user command, DUMP:SMEAS. The report will not be paginated.

Format 1 prints when no option is specified in the input command.

Format 2 prints when the SLK option is specified in the input command.

Format 3 prints when the NODE option is specified in the input command.

Format 4 prints when the CHN option is specified in the input command.

Format 5 prints when the LS option is specified in the input command.

Format 6 prints when the CLUSTER option is specified in the input command.

Format 7 prints if no nonzero measurements are encountered.

Format 8 prints in response to invalid input.

Format 9 prints when the dump is requested when the LPM data is being updated (just retry the command later).

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 1 through 6 print based on the option specified with the command.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|--|
| a | Name of measurement specified. |
| b | Measurement value. |
| c | Group number (0-63). |
| d | Member number (1-15). |
| e | Channel number (0-255). |
| f | Linkset number (1-255). |
| g | Cluster number (0-255). |
| h | Type of node (7, S, D) for (CCS 7, SADC, D Channel). |
| i | One of the following messages:

Measurement ID % is duplicated in the view
Cannot specify IDS % and % in the same view
Must provide SLK number
Must provide Cluster number
Must provide LS number
Must provide CHN number
Must provide Node number |

If a dump is made on a node's DLNBUSY measurement and a -1 is returned, this signifies that the measurement is not valid for this 5-minute collection period. This condition is caused by the 3B not collecting the node's measurements for one or more 5-minute collection periods and DLNBUSY becomes corrupted.

4. ACTION TO BE TAKEN

None.

Input Message
DUMP:SMEAS

SEE PROPRIETARY NOTICE ON COVER PAGE

ID DUMP:TAPE
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

This message has five formats.

- [1] DUMP TAPE HDR ABORTED - CAN'T OPEN TAPE DRIVE a
- [2] DUMP TAPE HDR ABORTED - READ ERROR ON a
- [3] DUMP TAPE HDR ABORTED - SYNC ERROR ON a
- [4] DUMP TAPE HDR ABORTED - CAN'T OPEN TMP FILE b
- [5] DUMP TAPE HDR COMPLETED
GENERIC - VERSION c
TYPE OF TAPE: d
TAPE WRITTEN: e
FILE SYSTEM: f

2. REASON FOR OUTPUT

To report the result of executing a DUMP : TAPE command.

3. VARIABLE FIELD DEFINITIONS

- a The path to the tape drive.
- b The path to the temporary file used for output message.
- c The generic version of the tape.
- d The type of generic tape that is mounted on the tape drive.
- e The time stamp on the tape when the tape was written.
- f The file system that the tape was written from, either ROOT or BROOT.

4. ACTION TO BE TAKEN

If the command aborts due to an open failure, check if the tape drive is in-service and on-line. If the command aborts due to a read error, clean the drive and retry. If read errors persist, the tape or drive could be faulty. If the command aborts due to a sync error, the tape is not an APS generic tape or the tape is not in a readable format.

5. REFERENCES

Input Message
DUMP : TAPE

SEE PROPRIETARY NOTICE ON COVER PAGE

ID DUMP:TDAS
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

- [1] DUMP TDAS DATA NOT ACCESSIBLE
- [2] DUMP TDAS SUCCESS COMPLETION
- [3] DUMP TDAS UNABLE TO WRITE 1A FORMAT TAPE - a
- [4] DUMP TDAS UNABLE TO WRITE 1A FORMAT TAPE - a
FAILED ON FILE b
- [5] DUMP TDAS 1A FORMAT TAPE COMPLETE - c BLOCKS WRITTEN

2. REASON FOR OUTPUT

To report the disposition of a DUMP:TDAS input message. TDAS data can be dumped in either a 3B format (cpio format) or a 1B format (same as pre-4AP2 TDAS tape on 1B processor). Formats 1 and 2 apply to both 3B and 1B format tapes. Formats 3, 4, and 5 apply only to 1B format tapes. The format specification is done in the DUMP:TDAS input message.

All TDAS related messages are recorded in the log file TDASLOG and may be accessed using the input command OP:LOG;TDASLOG.

3. VARIABLE FIELD DEFINITIONS

- a Error number in 1B format dump process:
 - 1 — Unable to logically open tape drive.
 - 2 — Unable to write to tape drive.
 - 3 — Unable to open TDAS data file.
 - 4 — Unable to logically close tape drive.
- b Path name of bad TDAS file.
- c Number of 512 byte blocks of data written to tape.

4. ACTION TO BE TAKEN

A good TDAS tape is written if either formats 2 or 5 print out.

For format 1, either the TDAS data base is not accessible or the process that dumps data in 1B format is not accessible. Use command ALW FILESYS MOUNT, SFN "/dev/tdas", DN "/tdas" to see if the TDAS data base is accessible. If the response is ALW FILESYS MOUNT STOPPED Mount device busy, the TDAS data base was accessible and was not the

SEE PROPRIETARY NOTICE ON COVER PAGE

problem. If the response is ALW FILESYS MOUNT COMPLETED, this was the problem; retry DUMP:TDAS input message. Otherwise seek technical assistance.

For format 3, if the tape drive specified in the DUMP:TDAS input message could not be accessed, check to see if the right tape drive was specified, if the tape drive is equipped, and if the tape is on-line.

If an internal error was found in the TDAS data base for format 4, retry the DUMP:TDAS command after the AUD:TDAS output message appears on the printer. The TDAS audit will run automatically.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID DUMP:UID
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

[1] DUMP UID a ADDR b [OFF c] COMPLETED #d
ADDRESS (HEX): CONTENTS OF MEMORY (HEX):
e f

[2] DUMP UID a ADDR b [OFF c] g #d

2. REASON FOR OUTPUT

To report the result of executing the DUMP:UID input message to dump out the contents of an address or address range in main memory.

3. VARIABLE FIELD DEFINITIONS

- a Utility ID of the target process.
- b Virtual address specified in input message.
- c Offset(s) used on input command line.
- d Generic Access Package (GRASP) execution sequence number.
- e Address label for line of data.
- f Data as dumped from memory.
- g Termination status:
- NOT STARTED NGUID — The DUMP was stopped because no copies of the specified process exist.
- STOPPED NGADDR — The DUMP was stopped because the address specified is not valid for the process, or invalid address values were encountered in address chain, if offsets were specified.

4. ACTION TO BE TAKEN

If the termination status is NOT STARTED NGUID, the process did not exist at the time the DUMP was attempted. If this happens repeatedly, a breakpoint could be defined and enabled for the process while no copies of the process exist. At the time a copy is created, the breakpoint would be planted in the enabled state.

If the termination status is STOPPED NGADDR, recheck the program listings. If offsets were specified, try breaking the chain into several parts and printing the intermediate addresses.

Another possibility is to define a breakpoint for that process and use the DUMP:UID message in the action list.

SEE PROPRIETARY NOTICE ON COVER PAGE

WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] EX CU a [b] [COMPLETED] d [({e|f})]
{MESSAGE|MSG} {IN PROGRESS|COMPLETE}
- [2] EX CU a [b] PH c d [({e|f})]
{MESSAGE IN PROGRESS|MSG IP}
- [3] EX CU a [b] PH c STF ({e|f}) MSG IP
TEST MISMATCH ACTUAL MASK EXPECTED
g h [i|N/A] [j|N/A] [k|N/A]
- [4] EX CU a [b] ABORTED AT PH c STMNT l d [({e|f})] MSG IP
- [5] EX CU a [b] TERMINATED AT PH c STMNT l AFTER TEST m
- [6] EX CU a [b] TASK n
{MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To report the result of executing an EX:CU input message to diagnose the Control Unit (CU) or one of its subunits in the interactive mode.

Format 1 specifies the overall diagnostic results and the termination status.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Member number (0 or 1).
- b Unit type and member number of the subunit under the CU which has been diagnosed; for example, CC 0, MASC 0, MASC 1, SAT 0, etc.
- c Phase number.
- d The result of the diagnostic:
 - ATP — All tests pass.
 - CATP — All tests run were ATP; some were not executed due to the unavailability of a system resource needed to perform the test.
 - NTR — No tests were run.
 - STF — Some tests fail.
- e If the result of the diagnostic is CATP or NTR, identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, (00000000 00000018), tests were skipped for reasons 3 and 4. Codes:
 - Bit 0 — Unused.
 - Bit 1 — Unit under test is forced on-line.
 - Bit 2 — Sanity timers are disabled.
 - Bit 3 — Emergency Action Interface (EAI) forces on CU, disk, sanity timer are active.
 - Bit 4 — Peripheral unit controller is out of service.
 - Bit 5 — Helper unit not specified or invalid.
 - Bit 6 — Helper unit unavailable.
 - Bit 7 — Unit under test is forced off-line.
 - Bit 8 — EAI initialization parameter buffer data pending; EAI must be cleared.
 - Bit 9 — Helper unit not connected to sub-unit under test.
 - Bits 10 — 63 - Unused.
- f If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000018), seven tests failed, plus tests were skipped for reasons 3 and 4. See previous list of codes.
- g Test number of the failing test.
- h The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
- i The bits which were actually received from the hardware device.
- N/A Data not available for the specified hardware device.
- j Determines which bits are of interest to this test.
- k The value which the test expected.
- l Last statement successfully executed before the diagnostic terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

m Current test number when diagnostic terminated.
n Task number assigned to the request.

4. ACTION TO BE TAKEN

If the result of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If the result of the diagnostic is STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance Manual* for repair procedures.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Dual Serial Channel/Computer Interconnect (DCI) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test. NTR — No tests were executed. STF — Some tests failed.
c	If the result of the diagnostic is CATP or NTR, identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, (00000000 00000018), tests were skipped for reasons 3 and 4. Code: Bits 0 — 63 — Unused.
d	If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. Code: Bits 0 — 63 — Unused.
e	Phase number.
f	Test number of the failing test.
g	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
h	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
i	Determines which bits are of interest to this test.
j	The value which the test expected.
k	Last statement successfully executed before the diagnostic terminated.
l	Current test number when diagnostic terminated.
m	Task number assigned to the request.

4. ACTION TO BE TAKEN

If the result of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If the result of the diagnostic is STF, the unit should be repaired as quickly as possible. See Practice 235-105-220 for the repair procedures.

- [4] EX DFC a ABORTED AT PH e STMT k b [({c|d})] MSG IP
- [5] EX DFC a TERMINATED AT PH e STMT k AFTER TEST l
- [6] EX DFC a TASK m {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Disk File Controller (DFC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b The result of the diagnostic:
- ATP All tests passed.
 - CATP All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test.
 - NTR No tests were executed.
 - STF Some tests failed.
- c If the result of the diagnostic is CATP or NTR, identifies the reasons tests were skipped in this phase by their bit position in a 16-digit hexadecimal number. For example, (00000000 00000018), tests were skipped for reasons 3 and 4. Codes:
- Bit 0 — Helper unit not specified or invalid.
 - Bit 1 — Helper unit cannot be reserved.
 - Bit 2 — Helper unit is not out-of-service.
 - Bit 3 — Helper unit is not ATP.
 - Bit 4 — Helper unit not connected to controller being diagnosed.

NOTE: To interpret CATP bits 32-46, the structure of the system must be understood. All device references are relative to the DFC under test, and may not correspond to "real" unit numbers. The down pointer of the DFC will point to the first Small Computer System Interface Bus (SBUS). The side pointer of the first SBUS points to the second SBUS. Similarly, the down pointer of an SBUS points to the first Moving Head Disk (MHD) beneath it. The side pointer of an MHD points to the next MHD in the chain. These concepts are displayed graphically on display pages 120 and 122. The leftmost SBUS under a DFC is considered first SBUS, with the rightmost SBUS being second. MHD relative numbering for each SBUS is top-down, with the top MHD being first and the bottom being last. Currently only four MHDs per SBUS are supported.

Additional CATP bits for the SCSI-DFC:

- Bit 32 — First MHD on first SBUS of DFC did not respond correctly.
- Bit 33 — Second MHD on first SBUS of DFC did not respond correctly.
- Bit 34 — Third MHD on first SBUS of DFC did not respond correctly.
- Bit 35 — Fourth MHD on first SBUS of DFC did not respond correctly.
- Bit 36 — Reserved for fifth MHD on first SBUS of DFC.
- Bit 37 — Reserved for sixth MHD on first SBUS of DFC.
- Bit 38 — Reserved for seventh MHD on first SBUS of DFC.

SEE PROPRIETARY NOTICE ON COVER PAGE

	Bit 40 — First MHD on second SBUS of DFC did not respond correctly.
	Bit 41 — Second MHD on second SBUS of DFC did not respond correctly.
	Bit 42 — Third MHD on second SBUS of DFC did not respond correctly.
	Bit 43 — Fourth MHD on second SBUS of DFC did not respond correctly.
	Bit 44 — Reserved for fifth MHD on second SBUS of DFC.
	Bit 45 — Reserved for sixth MHD on second SBUS of DFC.
	Bit 46 — Reserved for seventh MHD on second SBUS of DFC.
d	If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000006), seven tests failed, plus tests were skipped for reasons 1 and 2. See previous list of codes.
e	Phase number.
f	Test number of the failing test.
g	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
h	The bits that were received from the device.
N/A	Data not available for the specified hardware device.
i	Determines which bits are of interest to this test.
j	The value that the test expected.
k	Last statement successfully executed before the diagnostic terminated.
l	Current test number when diagnostic terminated.
m	Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, If the result of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

For Formats 2, 3, and 4, If the result of the diagnostic is STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance Manual* for the repair procedures.

[ERROR: b]
END ADDRESS = c
[ERROR: b]
REFRESH RATE = d MS
[ERROR: b]
NUMBER OF FAILURES = e
WORDS PER ARRAY TO COPY = g
[ERROR: b]
REFRESH DATA PARITY CHECK TIME = h SEC

2. REASON FOR OUTPUT

To echo the memory test parameters input manually as part of the Control Unit (CU) interactive diagnostic mode using the EX:CU input message in conjunction with EX:LDPARM input message. This output comes from main store diagnostic phases 95 or 96.

Format 1 is printed when Main Store Controller (MASC) phase 95 is executed. Format 2 is printed when MASC phase 96 is executed.

3. VARIABLE FIELD DEFINITIONS

- a First or lowest address in the address range of memory to be tested, in hexadecimal notation.
- b Error message explaining why previous line was not accepted:
ADDRESS MUST BE GREATER THAN 0
ADDRESS MUST BE ON FULLWORD BOUNDARY

SEE PROPRIETARY NOTICE ON COVER PAGE

- START ADDRESS GREATER THAN END ADDRESS
- END ADDRESS TOO LARGE
- NOT POSSIBLE REFRESH RATE
- ERROR VALID REFRESH RATES ARE 2, 4, 6, 8, 10, 12,
14, 16, 32, 36, 40, 44, 48, 52, 56, 60 (3B20D)
- ERROR VALID REFRESH RATES ARE 16, 18, 20, 22, 24,
26, 28, 30 (3B21D)
- c Last or highest address in the address range of memory to be tested, in hexadecimal notation.
- d Rate at which the memory is refreshed by the main store controller, in decimal notation.
- e Number of addresses for which failing information is to be collected, in decimal notation.
- f Data to be written into each memory location in the address range under test, in hexadecimal notation. (MASC phase 95.)
- g Words per memory array to copy from the online to the off-line memory, in hexadecimal notation. (MASC phase 96.)
- h Duration of time, in seconds, for which refresh data parity checks are allowed as a mechanism to scan for errors, in decimal notation. (MASC phase 96.)
For 3B21D, the value printed for this variable field is always zero.

4. ACTION TO BE TAKEN

Reenter the memory test parameters using the EX:CU and then EX:LDPARM input messages if the values are not as desired.

[1] EX LNa b c {ATP|CATP|NTR|STF} [d]

[2] EX LNa b PH e {ATP|CATP|NTR|STF} [d]
[TEST MISMATCH
f g]

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a Link Node (LN) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 is printed whenever the diagnostic results are printed for an individual phase.

3. VARIABLE FIELD DEFINITIONS

a A Ring Node (RN) group number (00-63).
b The ring node member number (1-15).
c Termination mode of diagnostic.
ABORTED — Diagnostic was abnormally stopped due to an external or internal error in execution, or a STOP:DMQ input request.
COMPLETED — Diagnostic passed normally.
TERMINATED — Diagnostic terminated under program control (early termination).

ATP All tests passed
CATP All tests that were executed were ATP. Some tests were not executed due to the inability to isolate, or to singularly isolate, the node under test.

NTR No tests run.
STF Some tests failed.

d If CATP or NTR, identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if d = 00000000 80000000, tests were skipped for reason 31.

SEE PROPRIETARY NOTICE ON COVER PAGE

The reason codes are as follows:

Bits 0 to 26 — Not used.

Bit 27 — Smart node memory board is not equipped.

Bit 28 — Attached Processor state variable indicates that this phase need not be run.

Bit 29 — Node under test is neither isolated nor in the RIUSBL minor state.

Bit 30 — Node under test was not the only isolated node.

Bit 31 — Node under test was not isolated.

Bits 32 to 63 — Not used.

If STF, Number of test failures in addition to the reasons that tests were skipped. For example, if d = 7 00000000 80000000, seven tests failed, plus tests were skipped for reason 31.

For Format 2, identifies the reason that some tests were skipped. This field is the same as in Format 1 except that the result of only one phase is reflected.

e Phase number.

f Test number of the failing test.

g An 8-digit hexadecimal number that indicates the bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.

4. ACTION TO BE TAKEN

If CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If STF, the unit should be repaired as quickly as possible.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID EX:LOOP
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] EX LOOP a [b] INVALID BEGIN
- [2] EX LOOP a [b] INVALID END d
- [3] EX LOOP a [b] BETWEEN ST c-d
- [4] EX LOOP REQUEST NOT YET ACTIVE NO ACTION TAKEN
- [5] EX LOOP REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN
- [6] EX LOOP ILLEGAL REQUEST TYPE NO ACTION TAKEN

2. REASON FOR OUTPUT

To report the result of executing an EX:LOOP interactive diagnostic command as part of an interactive diagnostic procedure.

Format 1 prints if the specified loop start data table statement number cannot be found.

Format 2 prints if the specified loop end data table statement number cannot be found by searching forward in the data table from the loop start statement.

Format 3 prints if a diagnostic program loop has been established as specified in the input command.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 5 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 6 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

- a Unit type and member number of unit under test.
- b Unit type and member number of the subunit under the unit under test.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Starting data table statement number.
- d Ending data table statement number.

4. ACTION TO BE TAKEN

For formats 1 and 2, reenter the input command using a valid start or end statement number.

For format 3, no action is needed.

For formats 4, 5, and 6, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the **OP:DMQ** input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the **STOP:DMQ** input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Moving Head Disk (MHD) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number (0 or 1).
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were executed. STF — Some tests failed.
c	If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000000), seven tests failed and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines which bits are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if the result of the diagnostic is STF, the unit should be repaired as quickly as possible. See the *Corrective Maintenance Manual* for the repair procedures.

- [5] EX MT a TERMINATED AT PH d STMNT j AFTER TEST k
- [6] EX MT a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

Prints the results of the diagnostic executed on the Magnetic Tape (MT) in interactive mode.

Format 1 prints at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnostic or RAW data was specified on the diagnostic request.

Format 3 indicates the diagnostic results for an individual failing phase.

Format 4 indicates the diagnostic was stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number (0 or 1).
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were executed. STF — Some tests failed.
c	If the result of the diagnostic is STF it identifies the number of test failures in addition to the number of tests skipped. For example, (7 00000000 00000000), seven tests failed and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines which bits are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Task number assigned to the request.

4. ACTION TO BE TAKEN

Formats 1, 5, and 6 are informational reports and require no action.

For Formats 2, 3, and 4, if the result of the diagnostic is STF, the unit should be repaired as quickly as possible; seek technical assistance.

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Magnetic Tape Controller (MTC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. CATP — All tests that were executed were ATP; some were not executed due to the unavailability of a system resource that was needed to perform the test. NTR — No tests were run. STF — Some tests failed.
c	If the result of the diagnostic is CATP or NTR, identifies the reasons tests were skipped by their bit position in a 16-digit hexadecimal number. For example, (00000000 0000018), tests were skipped for reasons 3 and 4. Codes: Bit 0 — Helper unit not specified or invalid. Bit 1 — Helper unit cannot be reserved. Bit 2 — Helper unit not out-of-service. Bit 3 — Helper unit is not ATP. Bit 4 — Helper unit not connected to controller under test. Bit 17 — Helper MT tape not mounted and/or transport door open. Bit 18 — Helper MT transport not in on-line mode. Bit 19 — Helper MT tape reel has no Write Enable Ring (WER). Bit 20 — Helper MT tape too long for diagnostic test tape. Bit 21 — Helper MT tape has no header block at BOT or header block indicates not diagnostic test tape.
d	If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons tests were skipped. For example, (7 00000000 0000006), seven tests failed, plus tests were skipped for reasons 1 and 2. See previous list of codes.
e	Phase number.
f	Test number of the failing test.
g	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
h	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
i	Determines which bits are of interest to this test.
j	The value which the test expected.
k	Last statement successfully executed before the diagnostic terminated.
l	Current test number when diagnostic terminated.
m	Task number assigned to the request.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the result of the diagnostic is CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If the result of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for the repair procedures.

1. FORMAT

- [1] EX PAUSE a [b] SUSPENDED AT ST c
- [2] EX PAUSE REQUEST NOT YET ACTIVE NO ACTION TAKEN
- [3] EX PAUSE REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN
- [4] EX PAUSE ILLEGAL REQUEST TYPE NO ACTION TAKEN

2. REASON FOR OUTPUT

To report the result of executing an EX:PAUSE interactive diagnostic command as part of an interactive diagnostic procedure.

Format 1 prints when the interactive diagnostic is suspended.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 4 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

- a Unit type and member number of unit under test.
- b Unit type and member number of the subunit under the unit under test.
- c Data table statement number.

4. ACTION TO BE TAKEN

For format 1, after the possible hardware troubleshooting, advance through the data table by issuing the EX:PAUSE command again or by issuing the EX:STEP command.

For formats 2, 3, and 4, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the OP:DMQ input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the

SEE PROPRIETARY NOTICE ON COVER PAGE

queue. Wait until the desired interactive diagnostic request becomes active, or use the STOP:DMQ input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

[2] EX:RPCNa 0 PH d {ATP|CATP|NTR|STF} [c]
[TEST MISMATCH
e f]

2. REASON FOR OUTPUT

To print the results of a diagnostic run on a Ring Peripheral Controller Node (RPCN) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 is printed whenever the diagnostic results are printed for an individual phase.

3. VARIABLE FIELD DEFINITIONS

- a A Ring Node (RN) group number (00-63).
b Termination mode of diagnostic.
ABORTED — Diagnostic was abnormally stopped due to an external or internal error in execution, or a STOP:DMQ input request.
COMPLETED — Diagnostic completed normally.
TERMINATED — Diagnostic terminated under program control (early termination), since further testing would not improve diagnostic resolution.

ATP All tests passed
CATP All tests that were executed were ATP. Some tests were not executed due to the unavailability of a system resource that was needed to perform the test, or due to the inability to isolate, or to singularly isolate, the node under test.

NTR No tests run.
STF Some tests failed.

c If CATP or NTR, Identifies the reason that tests were skipped in this phase by their bit position in a 16-character hexadecimal number. For example, if c = 00000000 00000006, tests were skipped for reasons 1 and 2.

SEE PROPRIETARY NOTICE ON COVER PAGE

The reason codes are as follows:

- Bit 0 — Helper unit invalid or not specified.
- Bit 1 — Helper unit cannot be reserved.
- Bit 2 — Helper unit not out-of- service.
- Bit 3 — Helper CU is not ATP.
- Bits 4 to 29 — Unused.
- Bit 30 — Node under test was the only isolated node.
- Bit 31 — Node under test was not isolated.
- Bits 32 to 63 — Unused.

If STF, number of test failures in addition to the reasons that tests were skipped. For example, if c = 7 00000000 00000006, seven tests failed, plus tests were skipped for reasons 1 and 2.

If STF for Format 2, identifies the reason that some tests were skipped. This field is the same as the field in Format 1 except that the result of only one phase is reflected.

- d Phase number.
- e Test number of the failing test.
- f An 8-digit hexadecimal number that indicates the bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.

4. ACTION TO BE TAKEN

If CATP, the needed system resource should be made available if possible, so that all tests may be executed.

If STF, the unit should be repaired as quickly as possible.

TYPE Output

1. FORMAT

- [1] EX STOP REQUEST NOT YET ACTIVE NO ACTION TAKEN
- [2] EX STOP REQUEST NOT IN INTERACTIVE MODE NO ACTION TAKEN
- [3] EX STOP ILLEGAL REQUEST TYPE NO ACTION TAKEN

2. REASON FOR OUTPUT

To report the result of executing an EX:STOP interactive diagnostic command but the appropriate interactive request could not be found.

Format 1 prints if the unit (and subunit) specified by the interactive diagnostic command is not in the active queue.

Format 2 prints if the unit (and subunit) specified by the interactive diagnostic command is in the active queue but not an interactive request.

Format 3 prints if the unit (and subunit) specified by the interactive diagnostic command could not be found in either the waiting or active queues.

3. VARIABLE FIELD DEFINITIONS

See Reason For Output.

4. ACTION TO BE TAKEN

For formats 1, 2, and 3, reenter the input command after an interactive diagnostic request for the specified unit (and subunit) becomes active. Check that the correct unit (and subunit) was specified in the input command. Use the OP:DMQ input command to display the requests in the queue. Enter the desired interactive diagnostic request if it is not in the queue. Wait until the desired interactive diagnostic request becomes active, or use the STOP:DMQ input command to remove other request(s) from the queue until the desired interactive diagnostic request becomes active.

APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] EX TTYC a [COMPLETED] b [(c)]
{MESSAGE|MSG} {IN PROGRESS|COMPLETE}
- [2] EX TTYC a PH d b [(c)] {MESSAGE IN PROGRESS|MSG IP}
- [3] EX TTYC a PH d STF (c) MSG IP
TEST MISMATCH ACTUAL MASK EXPECTED
e f [g|N/A] [h|N/A] [i|N/A]
- [4] EX TTYC a ABORTED AT PH d STMNT j b [(c)] MSG IP
- [5] EX TTYC a TERMINATED AT PH d STMNT j AFTER TEST k
- [6] EX TTYC a TASK l {MESSAGE STARTED|QUEUED|ABORTED}

2. REASON FOR OUTPUT

To print results of a diagnostic run on the Teletypewriter Controller (TTYC) in the interactive mode.

Format 1 is printed at the conclusion of diagnostic execution to specify the overall diagnostic results and the termination mode.

Format 2 indicates non-failing diagnostic results for an individual phase. This occurs if a partial diagnosis or RAW data was specified on the diagnostic request.

Format 3 indicates failing diagnostic results for an individual phase.

Format 4 indicates the diagnostic was abnormally stopped due to an external or internal error in execution, or an input request.

Format 5 indicates the diagnostic was terminated under program control (early termination), since further testing would not improve diagnostic resolution.

Format 6 indicates that the request has started, that the request could not be started due to resource contention (no openings in the active Deferred Maintenance Queue [DMQ] and the request is in the waiting DMQ), or that the request has aborted.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

a	Member number.
b	The result of the diagnostic: ATP — All tests passed. NTR — No tests were executed. STF — Some tests failed.
c	If the result of the diagnostic is STF it identifies the number of test failures in addition to the reasons that tests were skipped. For example, (7 00000000 00000000), seven tests failed, and no tests were skipped.
d	Phase number.
e	Test number of the failing test.
f	The bits that were in error. A 1 in a bit position indicates that the response from the unit did not match the expected response in that bit.
g	The bits which were actually received from the hardware device.
N/A	Data not available for the specified hardware device.
h	Determines which bits are of interest to this test.
i	The value which the test expected.
j	Last statement successfully executed before the diagnostic terminated.
k	Current test number when diagnostic terminated.
l	Task number assigned to the request.

4. ACTION TO BE TAKEN

If the result of the diagnostic is STF, the unit should be repaired as quickly as possible. Refer to Practice 235-105-220 for the repair procedures.

APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] EXC ENVIR PROC a {STARTED|IN PROGRESS|COMPLETED}
b
- [2] EXC ENVIR PROC a STOPPED
{CAN'T EXECUTE PROCESS a | ERRNO=c | NO CHILD PROCESS}

2. REASON FOR OUTPUT

To report the execution of a kernel or supervisor process.

Format 1 is printed if the process was run in the foreground.

Format 2 is printed if the process was run in the background.

NOTE: STARTED, IN PROGRESS, and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

3. VARIABLE FIELD DEFINITIONS

- a Pathname specified in the input command.
- b Result of the process executed.
- c System error code number. See System Error Codes Output Appendix, APP:SYSERR.

4. ACTION TO BE TAKEN

Refer to the input message for the correct format, and reenter the input message or check the status of the file using the OP:ST-LSTDIR input message if either of the first two Format 2 messages is printed.

Use the ALW:F-ACCESS input message to make the file executable, if necessary.

Seek technical assistance if the third Format 2 message or any other error message is printed.

COMPLETED [SEGMENT a] | STOPPED}
- [2] EXC ENVIR UPROC a STOPPED {[b] |
CANNOT EXEC c, ERRNO d | CANNOT CREATE A NEW PROCESS}
- [3] EXC ENVIR UPROC - PID = e

2. REASON FOR OUTPUT

Prints in response to a EXC:E-UPROC input message.

Format 1 is printed to report the result of executing a user process.

Format 2 is printed to report the reason the process was STOPPED.

Format 3 is printed to give the Process Identification (PID) if the process was executed in the background.

NOTE: STARTED, IN PROGRESS, and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

The STOPPED message appears when an error occurs in the executed pathname.

The SEGMENT information appears with IN PROGRESS and optionally with COMPLETED messages for segments 2 or greater.

3. VARIABLE FIELD DEFINITIONS

- a The number of segments output.
- b Result of the process executed. (Output will be zero, one, or multiple lines depending on the process executed.)
- c Pathname specified in the input message.
- d System error code. See System Error Codes Output Appendix, APP:SYSERR.

SEE PROPRIETARY NOTICE ON COVER PAGE

e User Process Identification (PID).

4. ACTION TO BE TAKEN

Refer to the input messages for the correct format, and reenter the input message or check the status of the file using the OP:ST-LSTDIR input message if the CAN'T EXEC message is printed.

Use the ALW:F-ACCESS input message to make the file executable, if necessary.

Seek technical assistance if CAN'T CREATE or any other error message appears.

APPLICATION .. 4E,CNI
TYPE Output

1. FORMAT

This message has two output formats:

[1] EXC LFS STARTED
LFS a b c [NEAR|FAR] d LBK ATTRIBUTES

LPBK CMPT	TEST PATTERN	MEAS DUR	ERROR TYPE	THR VALUE	NLST SYNC	NER BITS
-----	-----	-----	-----	-----	-----	-----
e	f	g	h	i	j	k
.	.	.	.	.	.	.
.	.	.	.	.	.	.

[2] EXC LFS COMPL
LFS a b REQUEST DENIED
l

2. REASON FOR OUTPUT

Format 1 is used in acknowledgment of an input EXC:LFS request.

Format 2 is used when an link fault sectionalization (LFS) request is rejected.

3. VARIABLE FIELD DEFINITIONS

- a Link group number (0-63).
- b Link member number (1-15).
- c Number of loopback components specified in the EXC:LFS command line.

TEST sequence progression specifier:

NEAR — Indicates LFS test started from the nearest specified loopback component to the farthest.

FAR — Indicates LFS test started from the farthest specified loopback component to the nearest.

- d Repetitive (>1) or single (1) operation. Must be a value in the range: (1-99).

1 — Indicates 1st operation of the loopback component.

2 — Indicates the 2nd operation of a unique loopback component.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e Specific loopback component (LC). Must be one of the following:
CSUL, CSUN, DSUL, DSUN, NEI, REM, RPT1 and RPT2 DPuu, where uu is a number in the range: (01 through 99 inclusive).
- f Test pattern type for LBK component.
- g Measurement duration of the test in hours, minutes, seconds respectively specified for the designated LC.
- h Errored threshold type specified for the designated LC.
- i Error threshold value specified for the designated LC.
- j Maximum number of lost synchronization specified for the indicated LC.
- k Maximum number of errored bits indicated for the designated LC.
- l Reason for rejecting the EXC:LFS input message. Possible reasons include the following:
Composite clock failure.
Invalid major state, valid state = AVL/UNA.
Invalid minor state, valid state = MOOS.
Invalid minor state, valid state = TEST.
LFS test in progress.
LFS test not in progress.
LID0 hardware failure.
LID0 software malfunction.
Link not in proper state to execute LFS.
Link not out of service.
Local loopback currently operated.
Manual near-end initiated LFS test in progress.
Manual remote initiated LFS test in progress.
Maximum LFS sessions exceeded, Retry later.
Near-end not equipped with a DS0-A SS7 link interface.
Network loopback currently operated.
Network loopback not operated.
Node cannot open LID0 channel.
Node out of service.
Overall test sequence exceeds 48 hours.
Remote loopback currently operated.
Remote loopback set in NEI mode.
Remote loopback set in OCU mode.
SLM is not in Proper state to execute LFS.
Timed out awaiting node response.

1. FORMAT

This message has four output formats:

- [1] EXC LID0 COMPL
LFS a b STATUS
NETWORK-INITIATED REMOTE LOOPBACK {RELEASED|OPERATED}
COMMAND-INITIATED REMOTE LOOPBACK {RELEASED|OPERATED}
LOOPBACK SELECT CODE: c
LFS TEST STATE: d
- [2] EXC LID0 COMPL
e
- [3] EXC LID0 COMPL
LFS a b IDLE
- [4] EXC LID0 COMPL
REQUEST DENIED
NO EXC:LID0(a,b):{NEI or EXC:LID0 (a,b) OCU - IN EFFECT

2. REASON FOR OUTPUT

- Format 1: Used in response to the command EXC:LID0 (with STATUS parameter).
- Format 2: In response to the command EXC:LID0 (with OPERATE|RELEASE parameters).
In response to the command EXC:LID0 (with OCUL|NEI parameters).
- Format 3: In response to the command EXC:LID0 (with IDLE parameter).
- Format 4: Rejects the command EXC:LID0 (with OPERATE|RELEASE parameters).
Rejects the command EXC:LID0 (with OCUL|NEI parameters).

3. VARIABLE FIELD DEFINITIONS

- a Link group number (0-63).
- b Link member number (1-15).
- c Current loopback select code (LSC) value for the network loopback device, if applicable. Must be one of the following:

NEI — Network element interface latching loopback.

SEE PROPRIETARY NOTICE ON COVER PAGE

OCU — Office channel unit latching loopback.

NOT APPLICABLE

d Current link fault sectionalization (LFS) TEST STATE. Must be one of the following:

MLFS — Indicates manual LFS testing in progress.

RLFS — Indicates remote LFS test in progress.

e Disposition of link interface DS0-A (LID0) loopback. Must be one of the following:

Loopback operated.

Loopback released.

Loopback select code set to network element interface (NEI).

Loopback select code set to office channel unit latching loopback (OCUL).

4. ACTION TO BE TAKEN

None.

ID EXC:MRVT
WORK CENTER.. MOC
GENERIC 4AP12 Rel. 3 and later
APPLICATION .. 4E,CNI
TYPE Output

1. FORMAT

- [1] EXC:MRVT PC a STPS b NO TRACE e n SUCCESS
- [2] EXC:MRVT PC a STPS b TRACE e n SUCCESS
STPS CROSSED c
- [3] EXC:MRVT PC a STPS b d e n f
MRVA MESSAGES RECEIVED j k l
STPS CROSSED [c]
ERRORS DETECTED
g h
i
- [4] EXC:MRVT PC a STPS b FAILURE, m

2. REASON FOR OUTPUT

Prints in response to an MRVT request. The output will be directed to the standard output associated with the initiator of the test, and also to the maintenance class. If they are the same device, only one printout will occur.

Format 1 prints when the MRVT is successful and the MRVT user did not request a trace.

Format 2 prints when the MRVT is successful and the user requested a trace.

Format 3 prints when either a partial success or failure occurs.

Format 4 prints by the initiating Signaling Point (SP) if the MRVT message cannot be sent due to local conditions.

3. VARIABLE FIELD DEFINITIONS

- a The point code of the terminating node for the test:
1) ANSI® Standard- nnnccmmm, 2) AT&T- nnnrrcmmm
Where:
 - c The cluster identifier
 - m The member identifier
 - n The network identifier
 - r The region identifier

NOTE: Non-local network point codes always use ANSI® standard format.

SEE PROPRIETARY NOTICE ON COVER PAGE

- b Value of the parameter N, which is the maximum number of STPs the MRVT is allowed to cross.
- c The list of STP point codes in the trace of a received MRVR message indicating success. If multiple success-indicating MRVR messages were received, this line would be printed for each such message (three success-indicating MRVR messages result in three lists of point codes).
- NOTE:** In Format 3, if f = FAILURE, item c will not be present in the output.
- d NO TRACE — If the user did not request a trace of all the STPs crossed. TRACE — If the user requested a trace of all the STPs crossed.
- e NO SRC — If the user requested NO SRC.
SRC — If the user requested an SRC, or made no entry for SRC.
- f FAILURE
PARTIAL SUCCESS
SUCCESS
- g Text phrase that describes the problem found:
ASYMMETRICAL ROUTE
EXCESSIVE LENGTH ROUTE
INACCESSIBLE SIGNALING POINT
LOOP
SUCCESS TO GATEWAY
TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS
TIMER EXPIRED
UNKNOWN ERROR CODE
UNKNOWN INITIATOR POINT CODE
UNKNOWN TERMINATOR POINT CODE
WRONG SIGNALING POINT
- n ASTN — User requested ASTN only.
SS7 — User requested SS7 only.
SS7 ASTN — User requested both.
- h Error number:
1 — Detected loop.
2 — Excessive length route.
3 — Unknown resource instance.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 4 — Route inaccessible.
- 5 — Processing failure.
- 6 — Unknown initiating SP.
- 7 — Timer expired.
- 8 — Wrong signaling point.
- 9 — Asymmetrical route.
- 10 — Success to gateway.

i

Point code(s) associated with the failure being reported.

Value of g Explanation of i

ASYMMETRICAL ROUTE — The point code of the SP that detected the asymmetrical route followed by the point code of the SP that sent the MRVT message causing the asymmetrical route.

EXCESSIVE LENGTH ROUTE — Point code of the SP detecting the excessive length route, followed by the point codes paired with the route priorities that were in the route up to the detecting SP.

INACCESSIBLE SIGNALING POINT — Point code of the SP that cannot access the inaccessible SP, followed by the point code of the inaccessible SP.

LOOP — Point code of the Signaling Point (SP) detecting the loop, followed by the point codes paired with the routing priorities used to get to the point codes enclosed in parentheses.

1 — Primary route.

2 — F-links.

3 — Alternate route.

SUCCESS TO GATEWAY — The point code of the gateway followed by the point codes paired with routing priorities used to get to the gateway and the nonlocal gateway point code.

TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS — Point code of the SP that cannot run the test.

TIMER EXPIRED — Point code of the SP where the timer expired, followed by the list of point codes from which expected MRVA messages were not received.

UNKNOWN ERROR CODE — The error number received that is not on the preceding list.

SEE PROPRIETARY NOTICE ON COVER PAGE

UNKNOWN INITIATOR POINT CODE— Point code of the reporting SP, followed by the point code of the SP that does not know the initiator.

UNKNOWN TERMINATOR POINT CODE— Point code of the SP that doesn't know the terminator, followed by the unknown terminator point code.

WRONG SIGNALING POINT— Point code of the SP that detected the error followed by the list of point codes in the TRACE.

NOTE: If multiple errors were detected, items g, h, and i will be printed for each error received.

j Point code of the SP from which the MRVA message was received.

k FAILURE

PARTIAL SUCCESS

SUCCESS

l The failure type in hexadecimal notation. At an intermediate SP, the failure types from the MRVAs received are logically ORed together. The initiating SP then prints the aggregate of failure types received in its MRVAs. MRVA failure types and the bits that represent them:

Asymmetrical route	— 0000 0000 1000 0000
Detected loop	— 1000 0000 0000 0000
Excessive length route	— 0100 0000 0000 0000
Processing failure	— 0000 1000 0000 0000
Route inaccessible	— 0001 0000 0000 0000
Success	— 0000 0000 0000 0000
Success to gateway	— 0000 0000 0100 0000
Timer expired	— 0000 0010 0000 0000
Unknown initiating SP	— 0000 0100 0000 0000
Unknown resource instance	— 0010 0000 0000 0000
Wrong signaling point	— 0000 0001 0000 0000

Example: MRVA MESSAGES RECEIVED
254999000 FAILURE 0x8200

The preceding MRVA had two errors:

- 1) detected loop - 0x8000
- 2) timer expired - 0x0200

SEE PROPRIETARY NOTICE ON COVER PAGE

m Text phrase that describe the problem found:
MAXIMUM MRVTS ALREADY IN PROGRESS
MRVT ALREADY IN PROGRESS WITH TERMINATOR
NO NEW TRANSACTIONS ALLOWED
SRC SHOULD BE 0 FOR ASTN
STPS NOT IN 0 - 15 RANGE
TERMINATOR IS UNKNOWN
TERMINATOR IS UNKNOWN VIA ASTN
TERMINATOR IS DCIS6 POINT CODE
TERMINATOR IS ALIAS FOR LOCAL PC
TERMINATOR SAME AS ORIGINATOR
UNABLE TO GET ASTN ROUTING

4. ACTION TO BE TAKEN

None.

2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

3. VARIABLE FIELD DEFINITIONS

- a Message type:
- ABORTED — Application request to stop the offline boot procedure; devices moved to the off-line side will be restored.
- COMPLETED — Indicates off-line side boot has completed.
- INFO — For information only.
- STOPPED — Manual request to stop the offline boot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
- TERMINATED — UNIX® RTR software-initiated termination of the offline boot procedure; devices moved to the off-line side will not be restored.

SEE PROPRIETARY NOTICE ON COVER PAGE

b

Text Line:

A CU IS FORCED — Printed by EXC:OFLBOOT if either CU 0 or CU 1 is forced on-line.

AIM REPORTED CHECKS FAILURE — AIM pre-offboot checks have failed.

AND NEITHER OOS NOR UCL WAS SPECIFIED — The specified unit is in the OOS state. For units in this state either the OOS or UCL options must be specified on the command line.

BOOT IN PROGRESS — Indicates the off-line side is booting.

BOTH IOP 0 AND IOP 1 CANNOT BE MOVED TO OFFLINE SIDE — Printed if both IOP 0 and IOP 1 were selected to move to the off-line side.

CANNOT ACCESS ECD — EXC:OFLBOOT encountered problems accessing ECD device information.

CANNOT BOOT FROM THIS DEVICE — It is not possible to boot from a device that is off-line for initialization level 2.

CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR j — A message requesting AIM to perform offline boot prechecks cannot be sent to the AIM process. Reason for failure is given in variable j.

CANNOT UPDATE ECD — The RC/V ECD cannot be updated. The reason is dependent on the function e printed:

DFS	Could not reserve a unit's UCB record as part of EXC:OFLBOOT pre-checks.
-----	--

UNRESERVE	Could not unreserve a UCB record while stopping offline boot. Some units' UCB records may remain reserved.
-----------	--

CANNOT VERIFY IF RC/V ECD SESSION IS IN PROGRESS — The timer for verifying if a disk RC/V ECD session is in progress has expired before the process that checks this responds.

CORRUPT ECD UCB RECORD FOR g h — EXC:OFLBOOT encountered inconsistent information about a device from RC/V ECD. For example, EXC:OFLBOOT accessed the RC/V ECD UCB record for a DFC and the device type in the UCB record is not DFC.

COULD NOT BUILD TABLE FOR UNKNOWN DEVICE — Indicates an illegal instruction inside EIH. Offline boot will be terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

DFC 2 OOS DFC 3 ACT AND UCL WAS NOT SPECIFIED — When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 2 is in the OOS state and DFC 3 is in the ACT state, the UCL option is required. Offline boot will be terminated.

DFC 2 OOS DFC 3 OOS AND UCL WAS NOT SPECIFIED — When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If both DFC 2 and DFC 3 are in the OOS state, the UCL option is required. Offline boot will be terminated.

DFC 3 OOS DFC 2 ACT AND UCL WAS NOT SPECIFIED — When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If DFC 3 is in the OOS state and DFC 2 is in the ACT state, the UCL option is required. Offline boot will be terminated.

DIAGNOSTICS IN PROGRESS — Indicates the specified device's RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

EXCEEDED STORAGE CAPACITY FOR STORING DEVICE INFORMATION — Indicates overflow in internal tables holding device information for offline boot.

HAS CORRUPT UNIT NUMBER — The unit number for the MTTYC is greater than or equal to 2 and this is invalid.

HAS DEVICE TYPE ROP — A UCB record with device type ROP was found whose parent controller was not MTTYC or TTYC.

IN DISK INDEPENDENT OPERATION MODE — Printed if the system is in disk independent operation mode.

INITLVL 2 INCOMPATIBLE WITH ANY MHD IN OFL STATE — Invoking offline boot with initialization level 2 will be rejected if any MHD is in the OFL state. Offline boot will be terminated.

MODE MUST BE OLBIDLE TO BOOT OFFLINE — This message indicates that either offline boot is already in progress or offline boot is not supported.

MUST BE ACT OR OOS FOR SPLITTING — When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

SEE PROPRIETARY NOTICE ON COVER PAGE

MUST BE ACT FOR INITLEVEL 2 — The TTY device selected to be the off-line pseudo-ROP is OOS. Also selected was an initialization level 2. Because devices are not automatically restored during this level of initialization, the TTY would have remained OOS in the off-line side after the initialization, that is, there would not have been a pseudo-ROP in the off-line side. This condition cannot be overridden with the OOS or UCL options.

MUST BE STBY FOR INITLEVEL 2 — Boot level 2 was selected and the off-line CU is not in the STBY state. The incorrect state is given in variable j.

NO DISK FORCED — Indicates a DFC is not forced.

NO EXC OFLBOOT IN PROGRESS MESSAGE WILL PRINT — Printed when all internal timer slots have been used and a new timer cannot be obtained to print the EXC-OFLBOOT, IN PROGRESS messages.

NO TIMER SLOTS AVAILABLE — Printed when all internal timer slots have been used. Timer slots are freed at this point.

NOT ACTIVE — Printed if the specified device is not in the ACT state. The incorrect state is given in variable j.

NOT SPLITTING - DFC 2 UNEQIP — When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

NOT SPLITTING - DFC 3 UNEQIP — When more than two DFCs are present, offline boot will attempt to pair even and odd DFCs; that is, DFC 0 and DFC 2, and DFC 1 and DFC 3. If either DFC 2 or DFC 3 is in the UNEQIP, GROW, OFL, or STBY state, both DFC 2 and DFC 3 will remain in the on-line side. The offline boot will continue without splitting DFC 2 and DFC 3.

OFFLINE SIDE BOOT COMPLETED — The offline side boot sequence completed successfully.

OFFLINE SIDE BOOT COMPLETED WITH ERRORS — The offline side boot sequence completed with errors. A REPT:OFLBOOT message was printed to explain the error.

OLBSTATE c NOT EXC_LCKECD — Printed if offline boot is not in the EXC_LCKECD state when EXC:OFLBOOT expects it to be. OLBSTATE is corrupt or an internal timer was not cleared correctly.

SEE PROPRIETARY NOTICE ON COVER PAGE

OLBSTATE c NOT EXC_PRCK — Printed if offline boot is not in the EXC_PRCK state when EXC:OFLBOOT expects it to be. OLBSTATE is corrupt or an internal timer was not cleared correctly.

OLBSTATE MUST BE OLBIDLE TO BOOT OFFLINE — This message indicates that either an offline boot is already in progress or the value stored in OLBSTATE is corrupted.

ONLY ONE BOOT DEVICE — Only one boot device is installed. Minimally, both MHD 0 and MHD 1 need to be installed for a system to be considered fully duplex.

SPECIFIED TTY DOES NOT EXIST — The TTY device specified in the command line is invalid.

STATE UNACCEPTABLE FOR OFFLINE BOOT — The major state of a device is not in the state needed while attempting to boot off-line. The incorrect state is given in variable j.

SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS — Printed if command line options do not match system status. This message will be output if any of the conditions are true:

- required unit is OOS and neither OOS nor UCL was specified
- specified TTY does not exist
- specified IOP does not exist
- both IOP 0 and IOP 1 are selected for moving
- a primary disk was not forced
- a CU is forced
- only one bootable disk is available or one of the bootable disks is not equipped
- mate CU state is not STBY or OOS
- if any RC/V ECD UCB record is reserved.

This list is not exhaustive. Additional information is provided in a previous output message. Refer to it for a description of the problem.

TIME OUT -- AIM OFLBOOT PRECHECKS — Printed when the timer for AIM offline boot prechecks expires.

TIME OUT -- CANNOT SPAWN USER PROCESS — Printed when a timer expires for creating a process to verify if a disk RC/V ECD session is in progress.

UCL PASSWD FILE CANNOT BE OPENED FOR WRITING — See action to be taken.

SEE PROPRIETARY NOTICE ON COVER PAGE

UCL PASSWD FILE DOES NOT EXIST, SET TO k—The password file does not exist when the UCL option is used for the first time. A new encrypted password k is generated automatically.

UCL PASSWD FILE HAD BAD FORMAT, RESET TO k—Either the file was empty or its contents was damaged. A new encrypted password k is generated automatically.

UCL PASSWD IS INVALID, RESET TO k—The password supplied by the user is incorrect. A new encrypted password k is generated automatically.

UNEXPECTED MESSAGE FROM AIM—Indicates a message was received unexpectedly from AIM.

UP POINTER IS INVALID—Printed when the RC/V ECD UCB record for a device (containing the up pointer) has been corrupted.

WILL BE MOVED TO OFFLINE SIDE—Printed when an IOP has not been selected to be moved to the off-line side, but offline boot selected it to be moved. It was selected because one of its TTYs was listed on the command line.

- c Current offline boot state.
- d Previous offline boot state.
- e Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.
- f Line number in the function e from which the output message originated. This field is used by UNIX® RTR, in conjunction with field e, to diagnose offline boot problems.
- g String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the Input Member Numbers Appendix, APP:MEM-NUM-C.
- h Device number. A value of zero, when used with g, could form DFC 0, for example.
- i Device state.
- j Reason message could not be sent.
 - 0 — Process is not attached to its port or port is invalid.
 - 8192 — Process cannot queue more messages.
 - 1 — Cannot allocate system message buffer.
- k To obtain a legal password for using the UCL option, seek technical assistance, and provide the encrypted password k. The value k will change every time the UCL option is entered; thus, using the UCL option always requires contacting technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

For Format 1, no action needs to be taken.

For Formats 2, 3, 4, and 5, the action to be taken depends on text line:

A CU IS FORCED — Clear the forced on-line CU and try offline boot again.

AIM REPORTED CHECKS FAILURE — Clear problem with application; try offline boot again.

AND NEITHER OOS NOR UCL WAS SPECIFIED — Either restore the device or add OOS or UCL to the EXC:OFLBOOT command line.

BOOT IN PROGRESS — This message is for information only; no action is needed.

BOTH IOP 0 AND IOP 1 CANNOT BE MOVED TO OFFLINE SIDE — Specify only one primary IOP (IOP 0 or IOP 1) in addition to any other IOPs (IOP 2, IOP 3, etc.). Try offline boot again.

CANNOT ACCESS ECD — Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.

CANNOT BOOT FROM THIS DEVICE — Restore boot device and try offline boot again. If the device cannot be restored, try offline boot again with initialization level 3 or 4.

CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR j — Seek technical assistance.

CANNOT UPDATE ECD — The action to be taken depends on the function e output with the message:

DFS Run RC/V ECD audits. If the audits pass, try offline boot again.

UNRESERVE If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in this case, the UCB record needs to be unreserved manually or through the ECDOWN audit.

CANNOT VERIFY IF RC/V ECD SESSION IS IN PROGRESS — Try offline boot again.

CORRUPT ECD UCB RECORD FOR g h — Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.

COULD NOT BUILD TABLE FOR UNKNOWN DEVICE — Save the ROP output and seek technical assistance.

DFC 2 OOS DFC 3 ACT AND UCL WAS NOT SPECIFIED — Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the EXC:OFLBOOT input message for more information on UCL.

DFC 2 OOS DFC 3 OOS AND UCL WAS NOT SPECIFIED — Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the EXC:OFLBOOT input message for more information on UCL.

SEE PROPRIETARY NOTICE ON COVER PAGE

DFC 3 OOS DFC 2 ACT AND UCL WAS NOT SPECIFIED — Try offline boot again specifying the UCL option.

NOTE: The UCL option inhibits application-initiated aborts during offline boot. See the EXC:OFLBOOT input message for more information on UCL.

DIAGNOSTICS IN PROGRESS — Wait for diagnostics to complete, fix any problems, and then try offline boot again. If diagnostics are not running, the RC/V ECD UCB record is corrupt. In this case, the UCB needs to be unreserved manually or through the ECDOWN audit.

EXCEEDED STORAGE CAPACITY FOR STORING DEVICE INFORMATION — Save the ROP output and seek technical assistance.

HAS CORRUPT UNIT NUMBER — Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this MTTYC; the unit value should be 0 or 1. Try offline boot again.

HAS DEVICE TYPE ROP — Run audits ECD 1 and ECD 3. If the audits pass, verify RC/V ECD UCB record for this unit. The device type of the ROP controller must be MTTYC or TTYC. Try offline boot again.

IN DISK INDEPENDENT OPERATION MODE — This message is for information only; no action is needed.

INITLVL 2 INCOMPATIBLE WITH ANY MHD IN OFL STATE — Either change the state of affected devices from OFL or specify INITLVL 3 or 4; then try offline boot again.

MODE MUST BE OLBIDLE TO BOOT OFFLINE — Allow the existing offline boot process to complete or seek technical assistance.

MUST BE ACT OR OOS FOR SPLITTING — This message is for information only; no action is needed.

MUST BE ACT FOR INITLEVEL 2 — Restore the specified TTY, or select another TTY that is ACT, or do not specify the TTY option, or use initialization level 3 or 4.

MUST BE STBY FOR INITLEVEL 2 — Change the state of this device to the state needed by EXC:OFLBOOT; try offline boot again.

NO DISK FORCED — Force a DFC; try offline boot again.

NO EXC OFLBOOT IN PROGRESS MESSAGE WILL PRINT — This message is for information only; no action is needed.

NO TIMER SLOTS AVAILABLE — This message is for information only; no action is needed.

NOT ACTIVE — Change the state of this device to the state needed by EXC:OFLBOOT; try offline boot again.

NOT SPLITTING - DFC 2 UNEQIP — This message is for information only; no action is needed.

NOT SPLITTING - DFC 3 UNEQIP — This message is for information only; no action is needed.

SEE PROPRIETARY NOTICE ON COVER PAGE

OFFLINE SIDE BOOT COMPLETED — This message is for information only; no action is needed

OFFLINE SIDE BOOT COMPLETED WITH ERRORS — See associated REPT:OFLBOOT message for explanation of error. Do NOT start a side switch without first seeking technical assistance.

OLBSTATE c NOT EXC_LCKECD — Seek technical assistance.

OLBSTATE c NOT EXC_PRCK — Seek technical assistance.

OLBSTATE MUST BE OLBIDLE TO BOOT OFFLINE — Allow the existing offline boot process to complete or seek technical assistance.

ONLY ONE BOOT DEVICE — Add another boot disk; try offline boot again.

SPECIFIED TTY DOES NOT EXIST — Choose a valid TTY and try offline boot again.

STATE UNACCEPTABLE FOR OFFLINE BOOT — Change the state of this device to the state needed by EXC:OFLBOOT; try offline boot again.

SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS — No action is needed.

TIME OUT -- AIM OFLBOOT PRECHECKS — Try offline boot again.

TIME OUT -- CANNOT SPAWN USER PROCESS — Try offline boot again.

UCL PASSWD FILE CANNOT BE OPENED FOR WRITING — The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance to manually construct a valid password file.

UCL PASSWD FILE DOES NOT EXIST, SET TO k — The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password k to obtain a legal password, and try offline boot again.

UCL PASSWD FILE HAD BAD FORMAT, RESET TO k — The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password k to obtain a legal password, and try offline boot again.

UCL PASSWD IS INVALID, RESET TO k — The use of the UCL option is not recommended; please, try to reconfigure the system in such a way that the UCL option is not needed. Otherwise, seek technical assistance, provide the encrypted password k to obtain a legal password, and try offline boot again.

UNEXPECTED MESSAGE FROM AIM — Seek technical assistance.

UP POINTER IS INVALID — Run audits ECD 1 and ECD 3. If the audits pass, try offline boot again.

WILL BE MOVED TO OFFLINE SIDE — This message is for information only; no action is needed.

2. REASON FOR OUTPUT

If no Translation Point Code (TPC) is specified in the SCCP Routing Verification Test (SRVT) initiation command and the initiating Signaling Point (SP) does not know how to obtain the Global Title Translation (GTT) for the specified Global Title (GT), the SP responds with **UNABLE TO DERIVE TPC**. In case of error in data entered in the initiation command, this message is followed by an appropriate indication identifying parameter(s) in the initiation command found to be in error by the SP. Otherwise one of the preceding formats is possible.

Prints out in response to the SRVT. The output will be directed to the standard output device associated with the initiator of the test, and to the maintenance class. If they are the same device, only one printout will occur.

Prints when one SRVT Request or Verify message was sent. The SRVT was successful and the SRVT user did not request a trace.

Prints when one SRVT Request or Verify message was sent. The SRVT was successful and the SRVT user requested a trace.

Prints when one SRVT Request or Verify message was sent. Either a partial success or a failure occurred on the SRVT.

Prints when two messages were sent for a single SRVT initiation request. The SRVT was successful and the SRVT user did not request a trace.

Prints when two messages were sent for a single SRVT initiation request. The SRVT was successful and the SRVT user requested a trace.

Prints when two messages were sent for a single SRVT initiation request. Either a partial success or a failure occurred on the SRVT.

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|---|
| a | Translation type (0 - 254). |
| b | Numbering plan from SCCP protocol, not included unless specified in the initiation command. Currently not used by the STP, may cause an error. |
| c | Encoding scheme from SCCP protocol, not included unless specified in the initiation command. Currently not used by the STP, may cause an error. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- d Digits in global title, 19 digits maximum (e.g., an 800 number).
- cccc Country code padded with zeros, up to 4 digits (0001 - 9999).
- e Translation point code to which the initiator should address and send an SRVT message. Not included unless specified in the initiation command. Printed in decimal notation (i.e., 254062001).
- f The maximum number of Translation Signaling Points (TSPs) allowed to be crossed.
- g The word(s) PARTIAL SUCCESS, or FAILURE depending upon the SRVT responses received.
- h The list of TSP point codes of a received SRVR message indicating success. If multiple success - indicating SRVR messages were received, this line would be printed for each such message.
- NOTE:** In Format 3, if g is FAILURE, item h will NOT be present in the output.
- i One of the following text phrases that describes the problem found.

LOOP 1
EXCESSIVE LENGTH ROUTE 2
NO TRANSLATION FOR GLOBAL TITLE 3
INACCESSIBLE SIGNALING POINT 4
INACCESSIBLE SIGNALING POINT 4X
TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS 5
TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS 5Y
UNKNOWN INITIATOR POINT CODE 6
TIMER EXPIRED 7
MESSAGE ARRIVED AT WRONG SIGNALING POINT 8
INCORRECT TRANSLATION FOR PRIMARY DESTINATION 9
INCORRECT TRANSLATION FOR SECONDARY DESTINATION 10
INCORRECT TRANSLATION FOR INTERMEDIATE TSP 11
NOT PRIMARY DESTINATION 12
NOT SECONDARY DESTINATION 13
PRIMARY DESTINATION NOT RECOGNIZED 14
SECONDARY DESTINATION NOT RECOGNIZED 15
UNRECOGNIZED POINT CODE FROM TRANSLATION 16
UNKNOWN ERROR CODE ZZ

Explanation of 4X values:

- 4A — Congestion
- 4B — Blockage
- 4C — Crossing Network Boundaries
- 4D — Not SS7 Equipped
- 4E — Subsystems Prohibited
- 4F — Received Unitdata Service Message

SEE PROPRIETARY NOTICE ON COVER PAGE

Explanation of 5Y values:

- 5A — Processor Overload
- 5B — Test Pertains To GT Which Is Already Under Test
- 5C — Tests Limit Threshold Exceeded

Explanation of ZZ values:

The ZZ can be any code aside from the previous listed codes. ZZ is an invalid error code.

j

Point code(s) associated with the failure being reported.

Value of i	Explanation of j
LOOP 1	Point code of TSP detecting the loop followed by the list of point codes in the loop.
EXCESSIVE LENGTH ROUTE 2	Point code of the TSP detecting the excessive length route followed by the point codes that were in the route up to the detecting TSP.
NO TRANSLATION FOR GLOBAL TITLE 3	Point code of the TSP that does not recognize the global title. If the numbering plan or the encoding scheme were included, this error may occur.
INACCESSIBLE SIGNALING POINT 4	Point code of the SP that cannot access the inaccessible SP followed by the point code of the inaccessible SP.
INACCESSIBLE SIGNALING POINT 4X	Point code of the SP that cannot access the inaccessible SP followed by the point code of the inaccessible SP. Detected at initiating SP.
TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS 5	Point code of the SP that cannot run the test.
TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS 5Y	Point code of the SP that cannot run the test. Detected at initiating SP.

SEE PROPRIETARY NOTICE ON COVER PAGE

Value of i	Explanation of j
UNKNOWN INITIATOR POINT CODE 6	Point code of the reporting SP followed by the point code of the SP that does not know the initiator.
TIMER EXPIRED 7	Point code of the SP where the timer expired followed by the list of point codes from which expected SRVAs were not received.
MESSAGE ARRIVED AT WRONG SIGNALING POINT 8	Point code of the wrong SP followed by a list of point codes that were in the route prior to the wrong SP.
INCORRECT TRANSLATION FOR PRIMARY DESTINATION 9	Point code of the TSP reporting the error in comparison followed by the complete list of TPCS traversed.
INCORRECT TRANSLATION FOR SECONDARY DESTINATION 10	Point code of the TSP reporting the error in comparison followed by the complete list of TPCS traversed.
INCORRECT TRANSLATION FOR INTERMEDIATE TSP 11	Point code of the TSP reporting the error in comparison followed by the complete list of TPCS traversed.
NOT PRIMARY DESTINATION 12	Point code of the incorrect primary destination followed by the list of point codes that were in the route prior to the error.
NOT SECONDARY DESTINATION 13	Point code of the incorrect secondary destination followed by the list of point codes that were in the route prior to the error.
PRIMARY DESTINATION NOT RECOGNIZED 14	Point code of the secondary destination that does not recognize the primary destination followed by the list of point codes that were in the route prior to the error.

SEE PROPRIETARY NOTICE ON COVER PAGE

Value of i	Explanation of j
SECONDARY DESTINATION NOT RECOGNIZED 15	Point code of the primary destination that does not recognize the secondary destination followed by the list of point codes that were in the route prior to the error.
UNRECOGNIZED POINT CODE FROM TRANSLATION 16	Point code of the TSP that does not recognize the translation result followed by the list of point codes that were in the route prior to the translating SP.
UNKNOWN ERROR CODE ZZ	Point code of the signaling point reporting the error followed by the list of point codes that were in the route prior to the reporting SP.

NOTE: If multiple errors were detected, items i and j will be printed for each error received.

k	The point code from which the SRVA message was received. Printed in decimal notation.
m	The word(s) SUCCESS, PARTIAL SUCCESS, or FAILURE as encoded in the message received.
n	The word SUCCESS.

4. ACTION TO BE TAKEN

None.

4. ACTION TO BE TAKEN

Formats 1,6,8,10,11,12,13,16,17,18,19,20 None.

Format 2, where g = one of the following states:

INVALID LINK TYPE FOR T1 TESTING
MAJOR STATE ISN'T AVL/UNA
MINOR STATE ISN'T MOOS
MINOR STATE ISN'T TEST

the node must be a Universal Link Node (ULN) or High Speed Link and the link must be in the AVL,MOOS or UNA,TEST state. Put the link in one of the previous mentioned states.

For all other values of g, if the action to be taken is not self explanatory, seek technical assistance.

g = [ACT | DEA] FE LLB SEQ FLD; LB'S DEACT'D CK INC

This message indicates that the request to activate or deactivate a FE LLB failed partially or completely, or partial T1 Facility failure (i.e. facility failure in only one direction) results in the FE LLB status being uncertain.

NOTE: See Appendix 16 for a description of FE LLB activation/deactivation sequences, and differences between Payload Loopback (PLB) and Line Loopback (LLB) capabilities and operation).

If the ACT FE LLB sequence fails (or the FE LLB status becomes unknown) at a step in the sequence beyond which an ACT FE LLB signal was sent toward the FE ULN, then an attempt is automatically made to execute parts of the Deactivate FE LLB sequence, so as not to leave a LLB activated, whenever possible, in an uncertain situation.

Whenever the ...; LB'S DEACT'D CK INC (complete or inconclusive) response is reported, the OSWF/tester should use the OP:T1M,ST...;RAW input message (near-end ULN access) to verify the activated/deactivated status of loopbacks in the Near-End (NE) ULN (and where possible, also in the FE ULN).

SEE PROPRIETARY NOTICE ON COVER PAGE

If the NE ULN's and the FE ULN's loopback status indications get out of agreement (due to directional facility failure, etc), then use the EXC:T1M commands to first clear any out-of-agreement loopback status indications, and then proceed to again activate the loopback from a condition where the loopback status indications are cleared (i.e. and are consistent between the NE and the FE ULN).

Format 3, restart the test session if desired.

Format 4, where c = NEAR END,

1. Verify that the ULN node is restored and that the ULN link state is AVL,MOOS or UNA,TEST.
2. Try the command again. If this second try also fails, then
3. Remove and restore the node, verify the ULN's link is in the proper link state, and try the command again. If this third try also fails, then
4. Enter the `OP:T1M,ST,...;NEULN:RAW` input command to collect information about the status of the ULN and seek technical assistance.

Format 4, where c = FAR END,

- A. Determine whether the T1 facility has failed.
Enter the `OP:T1M,ST,...;NEULN:RAW` input command to get the status of the ULN and the T1 facility. Examine the `OP:T1M,ST` output and verify That the T1 facility has not failed. If the `RSP_STAT UFRYATLO` field is not all zeroes, then use the `OP:T1M` output message to interpret the non-zero indications to determine whether a T1 facility failure has occurred.

If a T1 facility failure has occurred, and if the tester has direct access to the far-end ULN via its far-end STP (i.e., NOT via the failed T1 path), then the tester should be able to start/stop the test signal with the `EXC:T1M,...;NEULN;{START|STOP}` form of the input command on the far-end ULN.

- B. If the T1 facility has NOT failed, and the previous test attempts fail, then:
 1. Remove/restore the near-end ULN, ensure the ULN is restored and its link is in the AVL,MOOS or UNA,TEST link state, and retry the intended test procedure. If it still fails,
 2. Remove, restore the far-end ULN, ensure that the ULN is restored and its link is in the AVL,MOOS or UNA,TEST link state, and retry the intended test procedure. If it still fails, then seek technical assistance.

Format 5, try the command again. If the problem persists, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7, determine whether the denial might be due to the near-end T1 intrusive test status and the far-end T1 intrusive test status being out of agreement because of a previous/current T1 path failure.

Enter the `OP:T1M,ST,...;NEULN:RAW` input command for the near-end and the far-end ULNs, and examine the output to see whether the intrusive test statuses are consistent. If the near-end and the far-end status disagree, then use the `EXC:T1M,...;STOP` command to bring the statuses into agreement, then restart/resume testing.

Format 9, try the command again. If the problem persists, seek technical assistance.

Format 14, none, or Stop a test so that the desired test can be started.

Format 15, where `g = CBNMTCE GRD TMR T.O. AWAIT T1DH RESP`, (CBNMTCE Guard Timer Timeout Awaiting T1DH Response. CBNMTCE is a CNI process in the ULN.), or `FE CBNMTCE GRD TMR T.O. AWAIT T1DH RESP`, (Far End CBNMTCE Guard Timer Timeout Awaiting T1DH Response. CBNMTCE is a CNI process in the ULN.), try the command again, ensuring the node is fully restored. If the problem persists, seek technical assistance.

Format 15, where `g = CBNMTCE MTCE MODE NOT ENAB FOR ITR TST` (CBNMTCE Maintenance Mode Not Enabled For Intrusive Test. CBNMTCE is a CNI process in the ULN.), ensure that the link state is either AVL,MOOS or UNA,TEST, then try the command again. If the problem persists, seek technical assistance.

1. FORMAT

The following variations of the format describe the ways in which information can be represented in the output message.

- [1] FLUSH NVTSESS STOPPED CREATE TEMP
FILE FAILED ERROR NUMBER = n
- [2] FLUSH NVTSESS STOPPED OPEN tmp/NVT
FAILED ERROR NUMBER = n
- [3] FLUSH NVTSESS STOPPED MATCHED RECORD
FILE NOT FOUND ERROR NUMBER = n
- [4] FLUSH NVTSESS STOPPED MATCHED RECORD
FILE EMPTY ERROR NUMBER = n
- [5] FLUSH NVTSESS STOPPED MEMORY
ALLOCATION FAILED ERROR NUMBER = n
- [6] FLUSH NVTSESS STOPPED READ tmp/NVT
FAILED ERROR NUMBER = n
- [7] FLUSH NVTSESS FAILED
ERROR IN TERMINATION STATUS
- [8] FLUSH NVTSESS FAILED ERROR
IN AVAILABLE RECORDS FLAG
- [9] FLUSH NVTSESS COMPLETE
NO RECORDS ARE AVAILABLE
- [10] FLUSH NVTSESS COMPLETE
NO RECORDS: STILL SEARCHING
- [11] FLUSH NVTSESS FAILED
ERROR IN STREAM
- [12] FLUSH NVTSESS FAILED
INVALID PARAMETER TYPE ON OUTPUT
- [13] FLUSH NVTSESS IN PROGRESS

SEE PROPRIETARY NOTICE ON COVER PAGE

2. REASON FOR OUTPUT

To request the user to output all matched records that satisfied the search criteria in the input message.

To verify the correctness of a message, acknowledge receipt of a message, and to communicate with the user technician.

3. VARIABLE FIELD DEFINITIONS

None.

4. ACTION TO BE TAKEN

Formats 1 through 8, and 11 through 13 - Seek technical assistance.

Format 9 - Retry later.

Format 10 - None. May retry for later flush.

Input Message
FLUSH:NVTREC

SEE PROPRIETARY NOTICE ON COVER PAGE

ID FRMV:LN
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,IMS
TYPE Output

1. FORMAT

This message has three output formats:

- [1] FRMV a COMPL
 AT b
- [2] FRMV a NOT STARTED
 AT b
 c
- [3] FRMV a STOPPED
 AT b

2. REASON FOR OUTPUT

To report the results from an FRMV:LN input command, which requests removal of a node from service.

3. VARIABLE FIELD DEFINITIONS

- a LNx y
 - LN Indicates a link node.
 - x A ring node (RN) group number (00-63) with explicit leading zero for group numbers less than 10.
 - y The node's position in the RN group (1-15).
- b The contents of the 3B CU real time clock register (ms) when the request was received by the IMS driver process.
- c Reason the command was NOT STARTED:
 - RING NODE NOT IN ACT STATE
 - RING CONFIGURATION NOT STABLE
 - CONFLICT WITH IMS SYSTEM INITIALIZATION

4. ACTION TO BE TAKEN

Format 1: None. This message is for information only. The RMV:LN output message may also be printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 2: If **c** indicates the node was not in the ACT state, then either there is nothing to do or the **RMV:LN** command can do it. For other values of **c**, wait until the condition indicated by **c** changes and try again, if appropriate.

Format 3: This case is not expected. It indicates a failure return from the `_unrmv_iun` function in the `imsdrv.p` process.

TYPE Output

1. FORMAT

- [1] IN REMOTE WAITING
- [2] IN REMOTE IN PROGRESS
FILES RECEIVED: a IN PROGRESS
ELAPSED TIME b SPACE REMAINING c [IN PROGRESS]
INODES REMAINING d [IN PROGRESS]
[e ERROR f [IN PROGRESS]]
[CREAT ERRNO = g]

2. REASON FOR OUTPUT

Format 1 reports that the file-receive process is waiting for a session connect message from a remote sending site.

Format 2 reports totals for files successfully and unsuccessfully received from the Software Change Administration and Notification System (SCANS-2).

3. VARIABLE FIELD DEFINITIONS

- a Number of successfully received files.
- b Elapsed time in the form hours:minutes.
- c Number of blocks (512 bytes per block) remaining in the base directory on the receiving machine.
- d Number of inodes remaining in the base directory on the receiving machine.
- e Pathname of a file issued by the sending end which was not received by the file-receive process.
- f Error code specifying the reason why the file was not received by the file-receive process:
- 01 — Insufficient space on disk to store the file.
 - 02 — File length exceeds the maximum length permitted (2,500,000 bytes).
 - 03 — The pathname being processed matches that of a file already on disk.
 - 04 — Could not create incoming file on disk.
 - 05 — File transmission was interrupted.
 - 06 — The system command `mkdir ( )` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

g If the system command `creat()` failed (error code is 4), then this is the value of the error number set by `creat()`. For error number definitions, see the Appendix System Error, APP:SYSERR.

WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

IN REMOTE ERROR a[b][, ERRNO = c]
[INVALID TRANSACTION ID: d]
[NO TRANSACTION ID]
[READ FAILED]

2. REASON FOR OUTPUT

To report the termination of the file-receive process due to an error that is unrelated to the actual transmission of files. This message may occur either before, during, or after the transmission of files. `inremote` refers to the process created when `IN:REMOTE;START` input command is entered.

3. VARIABLE FIELD DEFINITIONS

- a Codes indicating the reason for termination:
- 01 — The file-receive process could not be executed.
 - 02 — A bad argument was passed to the file-receive process.
 - 03 — Time limit to establish the dial-up link has expired.
 - 04 — Non-positive number of blocks was specified on the command line.
 - 05 — Failed to connect to system port.
 - 06 — Failed `stat` call on base directory.
 - 07 — Failed `ustat` call on base directory.
 - 08 — Insufficient disk space in base directory.
 - 09 — Failed to read connect message, or received invalid connect message from the remote sending system. This message may be followed by a message indicating that `READ FAILED`, `NO TRANSACTION ID` was sent, or an `INVALID TRANSACTION ID` was sent. The latter will include the invalid Identification (ID) which was sent, as noted.
 - 10 — An error occurred in the printing of file-receive output messages.
 - 11 — An `IN:REMOTE;START` request was denied because a file-receive process already exists. Try the request again later.
 - 12 — An `IN:REMOTE;REPT` or `IN:REMOTE;STOP` request failed because a message could not be sent to `inremote` or file-receive process.
 - 13 — An `IN:REMOTE;REPT` or `IN:REMOTE;STOP` request failed because a message could not be sent to file-receive process or `inremote`.
 - 14 — Could not enable reception of messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 15 — Could not send message from file-receive process to inremote.
 - 16 — Bad message received by inremote.
 - 17 — Bad message received by file-receive process.
 - 18 — Unable to open Software Change And Notification System (SCANS) data link.
 - 19 — Unable to open Equipment Configuration Database (ECD).
 - 20 — Unable to get Unit Control Block (UCB) record for SDL0.
- b Error code indicating an ECD access problem or database inconsistencies:
- 100 — SDL is not active
 - 101 — no unit name listed as active in mdct record
 - 102 — stat() failed
 - 103 — lla_rdget() failed
 - 104 — lla_get() failed
 - 105 — lla_iatt() failed
 - 106 — getdbseg() failed
- c The system error number. See the system error code output appendix, APP:SYSERR. The system error number prints if the error code is 1, 5, 6, 7, 10, 14, or 15.
- d The invalid transaction ID received by the file-receive process.

4. ACTION TO BE TAKEN

Seek technical assistance. If required, cancel Broadcast Warning Message (BWM) order and reorder later.

TRANSACTION ID: a TIME: bb:bb

2. REASON FOR OUTPUT

To report initialization of the Software Change Administration and Notification System (SCANS-2) interface and to provide a transaction Identification (ID) to be used when ordering Broadcast Warning Messages (BWMs) from SCANS-2 within the next 24 hours.

3. VARIABLE FIELD DEFINITIONS

- a A transaction ID, from one to ten decimal digits and uppercase letters. This ID is supplied to SCANS-2 when BWMs are ordered. It is valid only for the next dial-in transmission of files, at which time SCANS-2 must present the transaction ID. If the ID time limit (24 hours) expires, the caller presents an invalid ID, or no ID, an IN:REM-ERROR output message will be displayed.
- b The time at which a 24-hour timer began, in the form hours:minutes.

4. ACTION TO BE TAKEN

Provide the transaction ID to SCANS-2 when ordering the next delivery of BWMs. The order must be placed and SCANS-2 must dial in to the computer within 24 hours of the appearance of this message.

IN REMOTE STOPPED a
[FILES MAY BE LOST]

2. REASON FOR OUTPUT

To report the reason for termination of the file receiving process.

3. VARIABLE FIELD DEFINITIONS

- a Reason for termination:
- 0 — Successful completion of the file transfer session.
 - 1 — Time limit to receive messages from the remote system has expired.
 - 2 — Unable to resynchronize messages with the remote sender.
 - 3 — Unable to resynchronize files with the remote sender.
 - 4 — Bad file sequence number.
 - 5 — Insufficient disk space to store incoming files.
 - 6 — Too many files interrupted.
 - 7 — An internal error occurred in the process.
 - 8 — The file receive process was terminated in response to the IN:REM-STOP input message.
 - 9 — An I/O error occurred in writing a file to disk.
 - 10 — The remote sender aborted transmission.
 - 11 — The file receive process terminated for an unknown reason. This message is followed by the FILES MAY BE LOST output line indicating that the file receive session died in an unknown state.
 - 12 — A bad disconnect message was received from the sender.
 - 13 — The system command mkdir() failed.

4. ACTION TO BE TAKEN

Verify that all files have been received. If the reason for termination is 11, this message may be ignored if preceded by an IN:REM-STOP or IN:REM-ERROR output message.

- [5] INH DCC APP a COMPLETE
INPUT ERROR - e
- [6] INH DCC APP a COMPLETE
ERROR b (LINE c) -- APPDB DCC CANNOT BE INHIBITED FOR a

2. REASON FOR OUTPUT

Response to the INH:DCC input command. Format 2 prints if a DCC task is in progress (DCC cannot be inhibited until any outstanding DCC tasks end and DCC is deactivated). Format 3 prints if the DCC task is activated (DCC must be deactivated via DEACTV:DCC before it can be inhibited). Format 4 prints if the INH:DCC command is requested via a remote login connection (eg. via IRAS PINET session). Format 5 prints if a syntax error was found in the INH:DCC command that was input. Format 6 prints if internal errors are preventing the 4ESS™ Switch from inhibiting DCC.

3. VARIABLE FIELD DEFINITIONS

- a The customer unit name specified in the INH:DCC input message. Currently only IBGTT is supported.
- b Error number (TBD).
- c Source line number where error was found. (For NESAC trouble-shooting.)
- d Transaction ID of the DCC task that is executing. The Transaction ID is specified with the START:DCC.
- e English description of the syntax error found in the command input.

SEE PROPRIETARY NOTICE ON COVER PAGE

REASON: SEND MSG TO DCHAN FAILED
- [7] INH DCNAUD a LNb c FAILED
REASON: RECEIVED _RTNMSG OR _SRCMATCH MSG

2. REASON FOR OUTPUT

To report the termination status of the INH:DCNAUD input message.

3. VARIABLE FIELD DEFINITIONS

- a Audit member. One of the following:
 - 1 — Data Blocks audit.
 - 2 — User call reference value (CRV) Table audit.
 - 3 — Network CRV Table audit.
 - 4 — Channel ID Table audit.
 - 5 — Idle Data Blocks List audit.
 - ALL — All D-Channel Node (DCN) audits.
- b DCN group number.
- c DCN member number.

SEE PROPRIETARY NOTICE ON COVER PAGE

ALL	All DCN nodes.
d	Audit inhibit status for all audits controlled by DCN. One of the following: ALREADY INHIBITED INHIBITED

4. ACTION TO BE TAKEN

Format 1 indicates successful execution. No action is necessary.

Format 2 indicates that the Audit Control Mechanism on the DCN is under initialization. Wait until the DCN finishes initialization and retry.

Format 3 indicates that the audit number is not valid. Retry with a correct audit number.

Format 4 indicates that the requested node is not a DCN. Retry with a correct group and member number for the DCN.

Format 5 indicates that the DCN is not active. Wait until DCN is active and retry.

Format 6 indicates that DCNAP can not send message to the DCN. Retry. If you get the same error multiple times, seek technical assistance.

Format 7 indicates that DCNAP received a returned or source matched message. Either the IMS channel is not open on the DCN or the DCN is not active.

REHCAL AUDIT IS ALLOWED FOR APP a
- [2] INH DLNAUD
CANNOT CHANGE INHIBIT STATUS OF INVALID APP b
- [3] INH DLNAUD
CANNOT CHANGE INHIBIT STATUS OF INVALID AUDIT TYPE c

2. REASON FOR OUTPUT

To print the results of an inhibit of application database audit.

3. VARIABLE FIELD DEFINITIONS

- a Application database that is affected. Valid values are:
 - IBGTT — Inbound global title translation
 - PCPGTT — Positive call processing global title translation
 - ATP — AT&T Trigger Platform (ATP) data tables
- b Invalid application database. Valid values are 0 (for IBGTT), 2 (for PCPGTT), or 3 (for ATP).
- c Audit type that the request was for. This message is printed whenever the value is not 128 or 129.

4. ACTION TO BE TAKEN

Allow or inhibit the audit when appropriate via the ALW:DLNAUD or INH:DLNAUD command.

ID INH:DMQ
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] INH DMQ COMPLETED
- [2] INH DMQ CANNOT INHIBIT A MANUAL SOURCE a
- [3] INH DMQ SOURCE ALL IS ALREADY INHIBITED
- [4] INH DMQ TOO MANY ACTIVE INHIBITS
- [5] INH DMQ CANNOT LCALL INHTIMER PROCESS a
FOR INHIBIT ERRNO = b

2. REASON FOR OUTPUT

Format 1 reports Maintenance Input Request Administrator (MIRA) has completed a request to inhibit a source of automatic maintenance requests.

Format 2 indicates MIRA does not inhibit manual source of maintenance requests listed.

Format 3 indicates source ALL is already inhibited.

Format 4 reports there are too many active inhibits. Cannot inhibit any more.

Format 5 reports MIRA could not start inhibit timer for automatic maintenance request source specified.

3. VARIABLE FIELD DEFINITIONS

- a Three-character name of the source specified in the INH:DMQ input message. ALL indicates all automatic maintenance requests are inhibited.
- b System error number returned for the failing system call. See System Error Codes Output Appendix, APP:SYSERR.

4. ACTION TO BE TAKEN

Use the OP:DMQ input message to determine which maintenance sources are inhibited.

For Formats 1 and 3, no action is required.

For Format 2, check syntax of source specified.

For Format 4, use ALW:DMQ to allow some of the inhibited sources and retry message.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 5, retry the input message. If retry is unsuccessful, an operating system function call is failing; seek technical assistance to clear the trouble.

TYPE Output

1. FORMAT

- [1] INH EAIINT a COMPLETED
- [2] INH EAIINT a COMPLETED WITH c
- [3] INH EAIINT a ABORTED b

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit Emergency Action Interface (EAI) error interrupts on a specified 3B21D computer Control Unit (CU), or on both 3B21D computer CUs.

NOTE: The 3B20D/3B21D computer CUs do not have EAI error interrupts.

Format 1 indicates successful completion.

Format 2 indicates successful completion with a message port problem.

Format 3 indicates an error.

3. VARIABLE FIELD DEFINITIONS

- a CU 0
CU 1
CU 0, CU 1.
- b Error codes:
 - 50 — Message could not be sent to a driver or Real Time Status (RTS) report.
 - 51 — Equipment Configuration Database (ECD) access function completed unsuccessfully.
 - 52 — Error in message communication.
 - 53 — Error internal to the inhibit administrator.
- c Port problems:
 - AN INVALID SYSTEM PORT SPECIFIED
 - AN INVALID SYSTEM PORT SPECIFIED FOR AIM — Application Integrity Monitor (AIM).

SEE PROPRIETARY NOTICE ON COVER PAGE

NO PROCESS ATTACHED TO THE SPECIFIED PORT
NO PROCESS ATTACHED TO THE AIM PORT

4. ACTION TO BE TAKEN

For Format 1, no action is necessary.

For Format 2, seek technical assistance.

For Format 3, use the **OP:ERRCHK** input message to learn the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a computer technical representative.

ID INH:FTA
WORK CENTER.. MOC
GENERIC 4AP12 Rel. 4 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

- [1] INH FTA APP a COMPLETE
FTA IS INHIBITED FOR a
- [2] INH FTA APP a COMPLETE
FTA IS INHIBITED FOR a - TRANSFER STILL IN PROGRESS
- [3] INH FTA APP a COMPLETE
FTA IS INHIBITED FOR a - ACTIVATION STILL IN PROGRESS
- [4] INH FTA APP a COMPLETE
FTA IS INHIBITED FOR a - TRANSFER AND ACTIVATION STILL IN PROGRESS
- [5] INH FTA APP a COMPLETE
REMOTE EXECUTION OF THIS COMMAND NOT ALLOWED
- [6] INH FTA APP a COMPLETE
INPUT ERROR - d
- [7] INH FTA APP a COMPLETE
ERROR b (LINE c) -- FTA CANNOT BE INHIBITED FOR a

2. REASON FOR OUTPUT

Response to the File Transfer and Activation (FTA) INH:FTA input command. Formats 1 through 4 are the normal responses and indicate that FTA has been inhibited. Formats 2 through 4 indicate as well that current FTA activity (either a file transfer or activation) is in progress. Format 5 prints if the INH:FTA command is requested via a remote login connection (e.g., via IRAS PINET session). Format 6 prints if a syntax error was found in the INH:FTA command that was input. Format 7 prints if internal errors are preventing the 4ESS™ Switch from inhibiting FTA.

NOTE: If the APP keyword argument was not specified in the corresponding IM message, the preceding formats will be slightly different. An Output Message will print, with "IN PROGRESS" on the first line instead of "COMPLETE", for each application programmed for FTA. A final "COMPLETE" message will print concluding the Output Message sequence. For example, instead of format 1 preceding, the output will be:

INH FTA IN PROGRESS
APPDB FTA IS ALLOWED FOR IBGTT

INH FTA IN PROGRESS

SEE PROPRIETARY NOTICE ON COVER PAGE

APPDB FTA IS ALLOWED FOR OBGTT

INH FTA IN PROGRESS
APPDB FTA IS ALLOWED FOR CORE

INH FTA COMPLETE

3. VARIABLE FIELD DEFINITIONS

- a The customer application specified in the INH:FTA input message.
 Either:
 IBGTT
 OBGTT (Refers to the PCP customer)
 CORE
- b Error number (TBD).
- c Source line number where error was found. (For NESAC trouble-shooting.)
- d English description of the syntax error found in the command input.

4. ACTION TO BE TAKEN

Formats 2 through 4: No action is necessary. In the case of a current file transfer, subsequent requests to enter or retrieve more data will not be allowed. In the case of a current file activation, the activation will "pause" until the "FTA inhibit" condition is removed. If the "FTA inhibit" condition is not removed after one hour, the activation will be stopped. (Note that while FTA is inhibited, requests to start new FTA activity - transfers or activations - will be denied.)

Format 7: Notify NESAC.

APPLICATION .. 4E
TYPE Output

1. FORMAT

This message has four formats.

- [1] INH RCV APPDB ACTIVE
- [2] INH RCV APPDB CANNOT SET LOCK - REASON a
- [3] INH RCV APPDB RETRY LATER - CANNOT CONNECT TO DATABASE
- [4] INH RCV APPDB CANNOT TALK TO DATABASE

2. REASON FOR OUTPUT

These output messages are printed as a direct result of the INH:RCV-APPDB input message. Format 1 prints if the "DLN Inhibit" feature has been activated with no problems. GTT10D RCV is inhibited.

Format 2 prints if a system error is encountered while trying to activate the inhibit. The "DLN Inhibit" feature is NOT activated.

3. VARIABLE FIELD DEFINITIONS

- a System error code. See Output Appendix APP:SYSERR.

4. ACTION TO BE TAKEN

No action required for Format 1.

If Format 2 prints, determine if system conditions indicate that trouble with 3B disk access is expected. NESAC should be notified if this trouble is not expected.

If Format 3 prints, the input message cannot establish a communication link with the RCV process. Probable cause: the RCV process does not exist or insufficient system resources are available for the operation. Wait and retry later.

If Format 4 prints, the input message has established a communication link with the RCV process, however, no data can be sent or received. Probable cause: the RCV process has a software problem or insufficient system resources are available for the operation. Wait and retry later. If the problem does not clear, notify NESAC.

[14] INH RUTILFLAG ABT
KERNEL RESPONSE TIMEOUT d

2. REASON FOR OUTPUT

Response to an INH:RUTIL input command.

Formats 1 and 2 indicate a successful completion of the INH:RUTIL input command.

Format 3 indicates that the breakpoint specified is invalid.

Format 4 indicates that the specified breakpoint is not set up.

Format 5 indicates that the breakpoint has an illegal status.

Format 6 indicates that a memory protection error has occurred.

Formats 7 and 8 indicate that creating the special file for the kernel has failed.

Formats 9 and 10 indicate that attempting to open the file for kernel processing has failed.

Formats 11 and 12 indicate that the kernel has returned a failing return code.

Formats 13 and 14 indicate that the kernel has not responded to the craft process.

3. VARIABLE FIELD DEFINITIONS

aa	The group number of the concerned node.
b	The member number of the concerned node.
c	The specified breakpoint number.
d	The value of the global variable errno.
e	Illegal breakpoint status value.
f	Memory protection error return.

4. ACTION TO BE TAKEN

For Formats 3 and 4, check the specified breakpoint number.

Otherwise seek technical assistance for Formats 5 through 14.

ID INH:SCSD
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

- [1] INH SCSD UNIT a PT b[bbbbbbb] f
- [2] INH SCSD GRPN c DUPID d PT e[eeeeee] f
- [3] INH SCSD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS

2. REASON FOR OUTPUT

To indicate whether a scan point was disabled as a result of executing an INH:SCSD input message. This prevents the reporting of a scan point's transitions.

Format 1 is used when a scan point is identified by physical location.

Format 2 is used when a scan point is identified by logical address.

Format 3 indicates the Scanner And Signal Distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

3. VARIABLE FIELD DEFINITIONS

- a Member number of Scanner And Signal Distributor (SCSD) unit.
- b Physical scan point number on an SCSD (0-47).
- c Name of the logical group.
- d Duplex group ID (0-1).
- e Number of a point within a logical group.
- f Termination status:
 - COMPLETED — Action completed.
 - FAILED — Action could not be completed by SCSD administrator:
 - SCSD unit number is invalid.
 - Point number is invalid for the logical group.
 - Logical group name is invalid and either the SCSD unit is Out Of Service (OOS) or is in an inactive state to the SCSD administrator.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

Issue the OP:00S input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter Recent Change and Verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the results are negative, seek technical assistance.

- [2] INH SFTCHK COMPLETED WITH b
- [3] INH SFTCHK ABORTED a
- [4] INH SFTCHK NOT STARTED
INVALID ID FIELD

2. REASON FOR OUTPUT

To indicate the result of a request to inhibit computer software checks.

3. VARIABLE FIELD DEFINITIONS

- a Error codes:
 - 50 — Message could not be sent to a driver or Real Time Status (RTS) report.
 - 51 — Equipment Configuration Database (ECD) access function completed unsuccessfully.
 - 52 — Error in message communication.
 - 53 — Error internal to the inhibit administrator.
- b Port problems:
 - Invalid system port specified.
 - Invalid system port specified for Application Integrity Monitor (AIM).
 - No process attached to the specified port.
 - No process attached to the AIM port.

4. ACTION TO BE TAKEN

If an error was reported, use the OP:ERRCHK input message to find out the resulting status of computer inhibits. All error codes associated with this activity are significant and should be reported to a technical representative.

If the process completes with a port problem, the user should seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID INH:TRAP
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,CNI
TYPE Output

1. FORMAT

This message has five formats.

- [1] INH TRAP
MTRP: INH TRAP ID ALL COMPL; NO ACT TRAP
- [2] INH TRAP
MTRP: INH TRAP ID ALL COMPL; ID(S) = a a a
- [3] INH TRAP
MTRP: INH TRAP ID ALL FAILED; b
- [4] INH TRAP
MTRP: INH TRAP ID COMPL; ID = a
- [5] INH TRAP
MTRP: INH TRAP ID FAILED; [b | c]; ID = a

2. REASON FOR OUTPUT

This output message is in response to the input message INH:TRAP.

Format 1: Prints when ID ALL is specified and there are no active traps in the Message Trap system.

Format 2: Prints when ID ALL is specified and there is one or more active traps to be inhibited. A list of the trap IDs that have been inhibited will be displayed.

Format 3: Prints when ID ALL is specified and there is one or more active traps to be inhibited. However, the processing of the INH:TRAP input message has failed due to the reason being printed.

Format 4: When one or a list of trap IDs is given, each trap specified will be inhibited in the given order. This format will be printed for the traps that have been successfully inhibited. One message per trap ID inhibited will be printed.

Format 5: When one or a list of trap IDs is given, each trap specified will be inhibited in the given order. Prints when the processing of a trap has failed due to the reason being printed. One message per ID failed will be printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- | | |
|---|---|
| a | Trap Identification Number |
| b | Reason INH:TRAP input message failed (internal error condition)

CAN'T GET INDEX
NO TRAP INHIBITED
INVALID TRAP STATE |
| c | Reason INH:TRAP input message failed

NOT ACT TRAP can only inhibit active traps

INVALID ID ID does not belong to any trap |

4. ACTION TO BE TAKEN

For Formats 1, 2 and 4, no action need be taken.

For Format 3, seek technical assistance.

For Format 5, if any of the reasons in category b are printed, seek technical assistance; otherwise, the reasons in category c are self-explanatory.

ID INH:UMEM
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

INH UMEM a WAS b NOW c #d

2. REASON FOR OUTPUT

To report that the transfer trace entered the STOPPED state either as the result of an INH:UMEM input message or the STOP FULL directive of the INIT:UMEM input message. The two cases can be distinguished by the 'priority of action' field which will be either M or A, respectively.

3. VARIABLE FIELD DEFINITIONS

- a Status of the operation:
- COMPLETED — The trace has stopped monitoring the flow of execution.
- NOT STARTED — The operation was ignored because the trace was not running.
- STOPPED UCERR — The utility circuit either does not respond or does not match the circuit present when the trace was defined.
- b State of the trace before the operation was attempted:
- DUMPED — The trace was not running and its data had already been dumped.
- NEW — The trace was not running and did not have data.
- RUNNING — The trace was collecting data.
- STOPPED — The trace was not running and did have data.
- UNDEF — No trace was defined.
- c State of the trace after the operation was attempted:
- DUMPED — The trace is not running and its data had already been dumped.
- NEW — The trace is not running and does not contain data.
- STOPPED — The trace is stopped and does contain data.
- UNDEF — No trace is defined.
- d Generic Access Package (GRASP) execution sequence number.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If status of operation is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

GENERIC 4AP12 and later
APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

INH UTIL a #b

2. REASON FOR OUTPUT

To indicate the disposition of an INH:UTIL input message or report Generic Access Package (GRASP) dynamic time overload.

3. VARIABLE FIELD DEFINITIONS

- a Termination status.
- COMPLETED — The action associated with breakpoints will not be executed when the breakpoint conditions occur.
- COMPLETED EAI — All defined breakpoints were inhibited by a request from Application Integrity Monitor (AIM).
- COMPLETED OVERLOAD — All defined breakpoints were automatically inhibited because of GRASP overload (due to breakpoints or trace processing). This message will appear when an overload condition occurs, even if no breakpoints are currently defined.
- STOPPED UCERR — The operation was completed successfully for software breakpoints but the utility circuit either does not respond or does not match the circuit present when the hardware breakpoints were defined.
- b GRASP execution sequence number.

4. ACTION TO BE TAKEN

If termination status is COMPLETED OVERLOAD, re-enable selected breakpoints and clear the others, or increase the dynamic time limit.

If termination status is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use the INIT:UC input message to reinitialize the circuit.

ID INIT:APPDB
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

- [1] INIT APPDB a IN PROGRESS
- [2] INIT APPDB a COMPLETE
customer unit b/c (byte offset in db file = d)
.
.
.
- [3] INIT APPDB a COMPLETE
ACTIVE DATABASE HAS APPDB FORMAT - VALID SID REQUIRED
- [4] INIT APPDB a COMPLETE
ACTIVE DATABASE HAS 4E16 FORMAT - VALID SID REQUIRED
- [5] INIT APPDB a COMPLETE
RETRY LATER - APPDB DATABASE IS CURRENTLY LOCKED
- [6] INIT APPDB a COMPLETE
[e]

2. REASON FOR OUTPUT

Formats 1 through 6 are output as a result of the execution of the INIT:APPDB input message.

Format 1 is output to indicate that the APPDB database format has begun (this process may take a while.)

Format 2 is the normal response for the INIT:APPDB input message. It indicates that the initialization has terminated with no errors.

Formats 3 through 6 are error indications.

3. VARIABLE FIELD DEFINITIONS

- a APPDB file name:
 - /dev/appdb0 — For ACTIVE file.
 - /dev/appdb1 — For SHADOW file.
 - /dev/appdb2 — For SCRATCH file.
- b Customer unit code.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Position of CU in database file.
- d Byte offset in database for the specified CU.
- e Error message.
 - mkappdb: cannot create segment -- errno is f
 - mkappdb: cannot create segment -- errno is f
 - mkappdb: dbname a does not exist
 - mkappdb: cannot open db a -- errno is f
 - mkappdb: cannot setio for db a -- errno is f
 - mkappdb: cannot lseek through a -- errno is f
 - mkappdb: cannot write a -- errno is f
- f UNIX system error code (see output Appendix APP:SYSERR).

4. ACTION TO BE TAKEN

Formats 3 and 4 indicate that the database requested in the INIT:APPDB input message has a valid APPDB format and either an invalid SID parameter or no SID parameter was specified in the INIT:APPDB input message. The input message should be retried with a valid SID parameter.

Format 5 indicates that some other action is being performed on the specified database. Retry the command later.

Format 6 indicates that a system error is preventing the APPDB file from being initialized. Try again later. If the system condition persists, notify NESAC.

2. REASON FOR OUTPUT

Format 1. Command not recognized.

Format 2. Missing the keyword TT or using an invalid TT.

Format 3. Internal error, the request to init was sent to the DLN to purge the process, however, the DLN did not acknowledge that the message was received.

Format 4. Encountered errors when attempting to send the init request to the DLN.

3. VARIABLE FIELD DEFINITIONS

- a Supplementary data to indicate the result of attempting to delete the database:
 - 4 — Timed out while waiting for the ring node address (RNA) to reply
 - 101 — General database failure, unsuccessful completion
 - 141 — File descriptor is out of range
 - 143 — Error on reading from the database
 - 144 — Error on writing to the database
 - 154 — Database inconsistencies have been detected
 - 155 — Cache inconsistencies have been detected
 - 156 — The ADMINTOC or DBTOC magic number is invalid
 - 157 — Invalid database type for this application

SEE PROPRIETARY NOTICE ON COVER PAGE

- 160 — Clump number is out of range for application
 - 190 — The application database value is invalid
 - 192 — The specified access mode is invalid
 - 193 — The specified customer identification number is invalid
 - 194 — The compaction table search chain exceeded maximum length
 - 196 — The DLN user buffer address is invalid
- b
- DLNCM Failures:
- 15 — Failed to get port to DLNCM
 - 16 — Failed to find home DLN
 - 17 — RNA specified is not a valid DLN
- Failure to open IMS channel:
- 1 — Cannot open because message switch is down
 - 7 — Out of read queues to allocate
 - 8 — Out of old write queues to allocate
 - 103 — Maximum open channels
 - 104 — Bad function name in the argument
 - 109 — Channel already open, wait 2 minutes then retry
- Failure to set IMS channel controls:
- 3 — Not your channel
 - 6 — Out of read queues to allocate
 - 8 — No read lists available
 - 9 — No new message lists available
 - 17 — No block read lists available
 - 101 — Bad channel number
 - 102 — Channel is closed
 - 106 — Could not make open request
- Failure to send message to DLN:
- 198 — Channel is closed
 - 199 — Bad channel number
 - 247 — Channel number out of range
 - 296 — Bad length of the message
 - 294 — Not enough space to satisfy the request

SEE PROPRIETARY NOTICE ON COVER PAGE

299 — Cannot open because message switch is down

343 — Internal error, retry

4. ACTION TO BE TAKEN

Formats 1 and 2. Check the input message and re-enter the message.

Formats 3 and 4. Wait a few minutes and retry the message again; if it fails, seek technical assistance.

5. REFERENCES

Input Message

- [1] INIT LNa b COMPL
START c END d
- [2] INIT LNa b NOT STARTED
START c END d
e
- [3] INIT LNa b STOPPED
START c END d
f

2. REASON FOR OUTPUT

To report the results from an INIT:LN input command, which requests removal from service and restart of a node.

3. VARIABLE FIELD DEFINITIONS

- | | |
|----|---|
| LN | Indicates a link node. |
| a | A Ring Node (RN) group number (00-63) with explicit leading zero for group numbers less than 10. |
| b | The node's position in the RN group (1-15). |
| c | The contents of the 3B Control Unit (CU) real time clock register (milliseconds) when the request was received by the Interprocess Message Switch (IMS) driver process. |
| d | The contents of the 3B CU real time clock register (milliseconds) when the request was completed or stopped by the IMS driver process. |
| e | Reason the command was NOT STARTED:

ANOTHER MANUAL RESTART IS IN PROGRESS

CONFLICT WITH IMS SYSTEM INITIALIZATION

RING CONFIGURATION NOT STABLE

RING NODE ALREADY BEING RESTARTED

RING NODE NOT IN ACT STATE

SOFTWARE IN THIS RING NODE NOT RESTARTABLE |

SEE PROPRIETARY NOTICE ON COVER PAGE

f Reason the command was STOPPED:

ABORTED -- DETAILS IN REPT IUN RESTRT

FAILED -- DETAILS IN REPT IUN RESTRT

FAILED, NO FAULT -- DETAILS IN REPT IUN RESTRT

RESOURCE PROBLEM -- _UNRESTRT RETURNED _FAIL

RESOURCE PROBLEM -- FAILED TO SEND NP RESTART
MESSAGE TO RING NODE

PROGRAM ERROR -- _UNRESTRT RETURNED _DENIED

PROGRAM ERROR -- _UNRESTRT RETURNED _RETRY

PROGRAM ERROR -- FAILED TO CHANGE RING NODE STATE TO
OOS

4. ACTION TO BE TAKEN

Format 1: None. This message is for information only. The RMV-LN and RST-LN output messages may also have been printed.

Format 2: If the reason the command was not started indicates the node was not in the Active (ACT) state, then it cannot be restarted. If the reason the command was not started indicates the software is not restartable, then the software in the node reported when it last entered the ACT state that it was not designed to be restartable. For these cases, if manual recovery is necessary, use the RST:LN input command. For other values of the reason the command was not started, wait until the condition indicated by the reason the command was not started changes and, if appropriate, try again.

Format 3: The ring node was removed from service but not successfully restarted, so it is no longer eligible to be restarted. The user should use the RST:LN input command to recover it. The RMV:LN and REPT:IUN-RESTRT output messages may also have been printed. Usually, the reason the command was stopped will be FAILED -- DETAILS IN REPT IUN RESTRT, the node will have been marked faulty, and the separately printed REPT:IUN-RESTRT output message will provide more details. The FAILED, NO FAULT ... case indicates the node was not marked faulty, but this case is not known to occur in the initial release of this command. A restart can be ABORTED by some systemwide initializations, by 3B20D/3B21D DMA faults or by automatic recovery. Values of the reason the command was stopped containing RESOURCE PROBLEM should seldom occur. Values of the reason the command was stopped containing PROGRAM ERROR should never occur -- they indicate software bugs.

- [3] INIT MHD a EARLY TERM VFY FAILED d
BLOCKS BLOCKS BLOCKS BLOCKS
k [k] [k] [k]
- [4] INIT MHD ABORTED b
ERROR DATA l m n o p

2. REASON FOR OUTPUT

To report the status of a request to format a Moving Head Disk (MHD).

This report may be invoked by either executing an INIT:MHD input message or by poking INIT MHD.

If the format process was invoked via the INIT MHD poke on the Data File System Access (DFSA) display page during Disk Independent Operation (DIOP) mode, a REPT:DKDIP message will precede the output message.

Format 4 provides additional error information when an explicit Small Computer System Interface (SCSI) command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

- a MHD member number.
- b ABORTED
ERROR
NOT STARTED
STOPPED
- c Process step or reason code:
f01 — Failed to fopen() /tmp file.
f03 — fseek() failed on the output file.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f04 — Failed to open Equipment Configuration Database (ECD).
- f05 — Failed to get UCB by name.
- f06 — Failed to get Unit Control Block (UCB) of controlling unit.
- f07 — Controlling unit is not active.
- f09 — MHD size not recognized.
- f0a — TRACK, BLOCK, or NEW are not valid for SCSI MHD.
- f0c — TRACK is not valid for SCSI MHD.
- f42 — BLOCK is not valid for Storage Module Device (SMD) MHD.
- f13 — Failed to get top UCB.
- f14 — Top UCB is not a Disk File Controller (DFC).
- f15 — Unknown DFC type.
- f18 — Failed to reserve UCB.
- f1b — Failed to assign special device file name.
- f1d — Failed to open device file.
- f21 — Failed to set Input / Output (I/O) mode of device file.
- f24 — Failed to enable message reception.
- f27 — See Disk Driver (DKDRV) report on the Read Only Printer (ROP).
- f30 — Head UPT address is not available.
- f36 — See DKDRV report on the ROP.
- f37 — DKDIP virtual address translation failure.
- f39 — See DKDRV report on the ROP.
- f42 — DFC Random Access Memory (RAM) read failed.
- f45 — Verify (VFY) data overwritten - repeat input request starting from track number.
- f46 — Start block greater than the LBA.
- f47 — See DKDRV report on the ROP.
- f48 — DKDIP virtual address translation failure.
- f49 — See DKDRV report on the ROP.
- f4c — Read of the DFC head Universal Pointer Table (UPT) failed.
- f4e — See DKDRV report on the ROP.
- f52 — Read of the DFC firmware UPT failed.
- f55 — Failed to get UCB of the MHD's SBUS by Record Identification (RID).

SEE PROPRIETARY NOTICE ON COVER PAGE

f58 — See DKDRV report on the ROP.
f5b — Read of the verify failure data failed.
f5e — Invalid verify data.
f63 — lseek() to "comb" defect table failed.
f64 — DKDIP virtual address translation failure.
f66 — First read of defect table failed.
f69 — lseek() to "comb" defect table failed.
f6a — DKDIP virtual address translation failure.
f6c — Second read of defect table failed.
f6e — Message to port failure.
f71 — Message reception failure.
f72 — Manual abort requested.
f73 — Manual abort requested.
f74 — Process timed out.
f78 — Failed to close special device file.
f7c — Failed to release special device file.
f7f — Failed to unreserve UCB.
f83 — Failed to close ECD.
f86 — Terminated externally with signal.
f94 — See DKDRV report on the ROP.
f99 — Message to port failure.
f9c — Message reception failure.
f9f — See DKDRV report on the ROP.
fa1 — Failed to get the segment number.
fa5 — SCSI "inquiry" command failed.
fa7 — SCSI "inquiry" command data underflow.
fa9 — Failed to get the segment number.
fb1 — SCSI "mode sense" command failed.
fb2 — Data overflow - too many block descriptors.
fb5 — Failed to get the segment number.
fb9 — SCSI "mode select" command failed.
fc1 — See DKDRV report on the ROP.
fc6 — Failed to get the segment number.

SEE PROPRIETARY NOTICE ON COVER PAGE

	fc9 — SCSI "read capacity" command failed.
	ffe — Aborted due to phase 1.
d	System error code number. See System Error Codes Output Appendix, APP:SYSERR.
e	COMPLETED IN PROGRESS STARTED
f	Number of failures (bad sectors for SMD MHD or bad blocks for SCSI MHD) found during the verify step.
g	Relative track number of the indicated bad sector. The track number is relative to the beginning of the disk. It is calculated using all tracks of the disk excluding those tracks mapped out by defect management. This variable field only applies to an SMD MHD.
h	Physical cylinder number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.
i	Physical head number of the indicated bad sector. This number is calculated using all tracks of the disk including those mapped out by defect management. This variable field only applies to an SMD MHD.
j	Sector number in use when the failure occurred. It is a relative number from 0 to 31. This variable field only applies to an SMD MHD.
k	Logical disk block number of the bad disk block found on the SCSI disk driver during the verify operation.
l	Command completion word. The command completion word is eight hexadecimal digits in the form AAAABBCC. AAAA = SCSI Job Block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, APP:DFC-K. BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, APP:DFC-K. CC = Fill. Not used.
m	First word of Extended Sense Data (ESD). See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits in the form AABBCDD. AA = Byte 0 of ESD. BB = Byte 1 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CC = Byte 2 of ESD.
- DD = Byte 3 of ESD.
- n Second word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits in the form AABBCDD.
- AA = Byte 4 of ESD.
- BB = Byte 5 of ESD.
- CC = Byte 6 of ESD.
- DD = Byte 7 of ESD.
- o Third word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits in the form AABBCDD.
- AA = Byte 8 of ESD.
- BB = Byte 9 of ESD.
- CC = Byte 10 of ESD.
- DD = Byte 11 of ESD.
- p Fourth word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits in the form AABBCDD.
- AA = Byte 12 of ESD.
- BB = Byte 13 of ESD.
- CC = Byte 14 of ESD.
- DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Noncompletion termination reports that provide an error code usually indicate a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

A termination report specifying a verification failure indicates that format information on the disk media could not be read, or is incorrect and could not be corrected. This disk media should not be used until the problem is corrected. For an SMD MHD, the HEAD and TRACK information is output to help determine if the problem is with the MHD (head alignment) or in the disk media (bad surface).

If Format 4 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

- [5] LOAD DFC a PUMP [CHECKSUM] FU ABORTED b
- [6] LOAD DFC a PUMP [CHECKSUM] FU COMPLETED d

2. REASON FOR OUTPUT

To report the result of executing a LOAD:DFC;PUMP input command.

3. VARIABLE FIELD DEFINITIONS

- a Member number of the Disk File Controller (DFC).
- b Process step or reason code:
 - f03 —Failed to open the Equipment Configuration Database (ECD).
 - f06 —Failed to get Unit Control Block (UCB) by name.
 - f07 —DFC is not an Small Computer System Interface (SCSI) device.
 - f09 —Failed to open the pump file.
 - f0a —Pump file is zero length (bytes) in size.
 - f0c —Failed to allocate buffer.
 - f0e —Failed to read the pump file header.
 - f13 —Failed to reserve the UCB.
 - f16 —Failed to assign special device file name for DFC.
 - f19 —Failed to open special device file for DFC.
 - f1b —Failed to enable message reception.
 - f1d —See Disk Driver (DKDRV) report on the Read Only Printer (ROP).
 - f1f —DFC is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f22 —See DKDRV report on the ROP.
 - f25 —Failed to close special device file.
 - f28 —Failed to re-open special device file for DFC.
 - f2a —DFC auto pump failed.
 - f2c —Failed to allocate a segment for buffer.
 - f2e —DFC pump failed.
 - f31 —Failed to notify DKDRV of the pump procedure completion.
 - f34 —Process timed out.
 - f37 —Failed to close special device file.
 - f3a —Failed to release special device file.
 - f3c —Failed to unreserve UCB.
 - f3e —Failed to close ECD.
 - f3f —Failed to close the pump file.
 - f41 —Read of the pump file failed.
 - f44 —Message to port failure.
 - f47 —Message reception failure.
 - f4c —Terminated externally with signal.
 - f4e —Invalid magic number in pump file header .
 - f51 —Invalid pump file header.
 - f54 —Unused portion of the pump file header is not zero.
- c System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- d INVALID PUMPCODE — Pumpcode failed the hashsum check.
 VALID PUMPCODE — Pumpcode has passed the hashsum check.

4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried. The pump failure can also be caused by the incompatibility between the pumpcode and firmware. The pump can also fail due to a corrupted pumpfile. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

	ff c —Failed to close no-rewind tape device.
	ff e —Aborted due to phase 1.
e	Multi-volume Digital Audio Tape (DAT) session number.
f	Multi-volume Digital Audio Tape (DAT) volume number.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If the message indicates that there is a problem with the tape, verify that the correct tape is loaded in the specified tape drive. If the message indicates that there is a problem accessing the tape drive, verify that the tape is loaded and the tape drive is active. If these checks fail to uncover the problem, or if the description of the error is not self-explanatory, seek technical assistance.

SCSI DEFECT COUNT CHECK ABORTED b
ERROR DATA e f g h i

2. REASON FOR OUTPUT

To report the result of executing a LOAD:MHD-DEF input message.

Formats 7 and 8 provide additional error information when an explicit Small Computer System Interface (SCSI) command fails. The additional error data is necessary to determine the exact cause of the error condition.

3. VARIABLE FIELD DEFINITIONS

a Moving Head Disk (MHD) member number.

SEE PROPRIETARY NOTICE ON COVER PAGE

b

Process step or reason code:

- f03 — Failed to fopen() input file.
- f06 — Failed to open the Equipment Configuration Database (ECD).
- f09 — Failed to get Unit Control Block (UCB) by name.
- f0a — Failed to get top UCB.
- f0b — Failed to get UCB of controlling unit.
- f0c — Controlling unit is not active.
- f10 — Top UCB is not a Disk File Controller (DFC).
- f12 — Unknown DFC type.
- f13 — MHD size not recognized.
- f14 — Drive size not supported by defect management.
- f15 — Failed to reserve the UCB.
- f16 — Failed to assign special device file name.
- f18 — Failed to open special device file.
- f21 — Failed to set Input / Output (I/O) mode of device file.
- f24 — Failed to enable message reception.
- f26 — Clear of MHD media access error counter failed.
- f27 — See Disk Driver (DKDRV) report on the Read Only Printer (ROP).
- f30 — Firmware version is not available.
- f39 — lseek() to "mfgr" disk address failed.
- f42 — Disk write failed.
- f44 — Clear of MHD media access error counter failed.
- f46 — Too many defect blocks specified.
- f48 — Incorrect defect spec file format.
- f4a — Block number not sorted in ascending order.
- f4b — Block number is out of range.
- f4c — Failed to get the segment number.
- f53 — See DKDRV report on the ROP.
- f56 — SCSI "reassign block" command failed.
- f59 — Too many defects specified.
- f6c — Incorrect defect spec file format.
- f6e — Cylinder number out of range.

SEE PROPRIETARY NOTICE ON COVER PAGE

f71 — Head number out of range.
f73 — Sector number out of range.
f76 — Head number not sorted in ascending order.
f79 — Cylinder number not sorted in ascending order.
f82 — Message to port failure.
f85 — Message reception failure.
f88 — Process timed out.
f8c — Failed to close special device file.
f8e — Failed to release special device file.
f91 — Failed to unreserve UCB.
f93 — Failed to close ECD.
f96 — Terminated externally with signal.
f99 — See DKDRV report on the ROP.
f9c — Read of the SCSI defect list header failed.
f9f — See DKDRV report on the ROP.
fa2 — Read of the SCSI defect list failed.
fa5 — Failed to get the segment number.
fa8 — Message to port failure.
fab — Message reception failure.
fae — Failed to get the segment number.
fb1 — See DKDRV report on the ROP.
fb3 — SCSI "inquiry" command failed.
fb5 — SCSI "inquiry" command data underflow.
fb9 — Drive not formatted with 512 bytes per logical block.
fba — Data overflow - too many block descriptors.
fbd — Data overflow - too many block descriptors.
fc2 — Failed to get the segment number.
fc4 — See DKDRV report on the ROP.
fc6 — SCSI "read capacity" command failed.
fc9 — Failed to get the segment number.
fcb — See DKDRV report on the ROP.
fce — SCSI "mode sense" command failed.
fd2 — Failed to get the segment number.

SEE PROPRIETARY NOTICE ON COVER PAGE

- fd4 — See DKDRV report on the ROP.
- fd6 — SCSI "mode sense" command failed.
- fd9 — diskinfo() library call failed.
- fdb — Unknown defect limit type.
- fde — Unexpected UCB equipage value..
- c System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- d Number of defects written.
- e Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.
- AAAA = SCSI Job Block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, APP:DFC-K.
- BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, APP:DFC-K.
- CC = Fill. Not used.
- f First word of Extended Sense Data (ESD). See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 0 of ESD.
- BB = Byte 1 of ESD.
- CC = Byte 2 of ESD.
- DD = Byte 3 of ESD.
- g Second word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 4 of ESD.
- BB = Byte 5 of ESD.
- CC = Byte 6 of ESD.
- DD = Byte 7 of ESD.
- h Third word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 8 of ESD.
- BB = Byte 9 of ESD.
- CC = Byte 10 of ESD.
- DD = Byte 11 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

- i Fourth word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.

AA = Byte 12 of ESD.

BB = Byte 13 of ESD.

CC = Byte 14 of ESD.

DD = Byte 15 of ESD.

4. ACTION TO BE TAKEN

A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

A termination report that specifies noncompletion provides an error code that usually indicates a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For a SCSI disk drive, the completion message may also include warnings as a result of checking the media defect count of the disk against:

The number of GROWN defects should be no more than a recommended limit over the useful life of the disk. If the recommended limit is exceeded, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) should not exceed the Lucent Technologies specification for the disk drive. If the disk has more than the number of defects allowed, the disk drive could become unreliable.

The total number of defects (PRIMARY and GROWN) on a cylinder should not exceed the recommended limit. If the number of defects on a cylinder is larger than the limit, the performance of the disk drive may degrade to the point that the disk drive may not be able to be used as a boot device in the 3B20D or 3B21D system.

Lucent Technologies recommends that the SCSI disk should be replaced if there is any warning output related to the recommendations.

NOTE: For SCSI disk, after new defect blocks are loaded, all the previous information about bad blocks (defects) becomes invalid. For example, bad logical block number 3 is not physically the same block after being loaded; in fact, it is now a good block number 3. Therefore, only a new defect (or defects) detected since the previous LOAD:MHD;DEFECT command should be included in the specfile used for loading new defects into the GROWN defect list.

If Format 7 or Format 8 prints, the SCSI disk drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

ID LOAD:RNA
WORK CENTER.. MOC
GENERIC 4AP12 and later
APPLICATION .. 4E
TYPE Output

1. FORMAT

[1] LOAD RNA a x INACCESSIBLE ERRNO = b

[2] LOAD RNA a x COMPLETED

2. REASON FOR OUTPUT

To report the result of executing the LOAD:RNA input message to load immediate data into the contents of an address of a node on the ring.

Format [1] indicates the error case; either the 3B could not communicate with the node (the node was OOS or nonexistent) or the input request could not be done.

Format [2] is the output format for a successful load operation.

3. VARIABLE FIELD DEFINITIONS

a	Ring Node Address (RNA) of the node that was dumped.
ERRNO = b	Error number indicating the reason the dump could not be done.
3	— ESRCH - Internal error - no such process or cdp driver in unknown state.
5	— EIO - Internal error - cannot lock or unlock data segment for DMA to/from ring.
6	— ENXIO - Unknown error.
7	— E2BIG - Internal error. Driver cdp set up with incorrect number of arguments.
14	— EFAULT - Bad address - out of range.
19	— ENODEV - No such node (BAD RNA) or node OOS.
22	— EINVAL - Invalid size request.
23	— ENFILE - Internal error. Temporary mknod set up with bad partition number.
44	— EFUNC - Invalid request type.
NP	Node processor physical memory.
AP	Attached processor physical memory.
APACI	Attached processor ACI translation memory.
APPDB	Attached processor APPDB translation memory.

4. ACTION TO BE TAKEN

If Format [1] occurs, determine the reason the output could not be made. Verify the hardware state of node using either OP:NODES or the 1105-1108 display pages. The

SEE PROPRIETARY NOTICE ON COVER PAGE

DUMP-RNA command only works if the node is in the IMS hardware (ECD) ACT state. If the node is ACT, then reverify the address to be loaded. Only the legal physical address range of the node may be loaded.

If the node goes OOS due to the act of this load, then the node will be restored from the disk version.

APPLICATION .. 4E,3B
TYPE Output

1. FORMAT

LOAD UPNM {BWM | CFT | TMP} a-b; c d

2. REASON FOR OUTPUT

To report the execution of the LOAD:UPNM input message.

3. VARIABLE FIELD DEFINITIONS

BWM	Indicates off-site originated update.
CFT	Indicates on-site originated update.
TMP	Indicates that this update must never be made permanent.
a	Last two digits of the year in which the update is applied.
b	Unique four-digit number identifying the update.
c	Termination status: ABORTED — Update was abnormally terminated due to a system error or an error in execution. This message is preceded by a UPD:SYSERR output message that identifies the specific system error. COMPLETED — Update completed normally. STOPPED — Update was halted because of a user error. This message is preceded by a UPD:USRERR output message that identifies the specific user error.
d	Type of process updated: K — Killable process. NK — Nonkillable process.

4. ACTION TO BE TAKEN

If variable c is:

ABORTED, Otherwise, no action is needed.

STOPPED, the error specified in the output message should be corrected and the LOAD:UPNM input message retried.

c	d	d	d	d	d	d	d	d	d	d	d	d	d	d	d	d

Output format when FILE is specified on the command line.

Rop data output format.

The rop format when FILE is the argument to the NPMEM keyword follows:

[2] NPMEM NPMEM FILE {RPCNx 0 | LNx y} a
n BYTES OUTPUT IN FILE - p f

File data output format

The file memory or port data dump is blocked by request. All data pertaining to that request will be contained within a single block. The block of data will be preceded by a date time stamp and the type, group, and position of the node. All data dump requests for a node are appended to one file (provided that the directory for file placement doesn't change). Therefore, a file can contain multiple dump requests. The maximum number of bytes per line of data dump is 16.

The format of the file produced when FILE is the argument to the NPMEM keyword follows:

t
[AP] {RPCNx 0 | LNx y}

b
c d

Output format when FILEROP is specified on the command line.

Rop data output format.

The memory data dump is blocked into 432 or smaller byte blocks for memory or port dumps. Dumps greater than 432 bytes will result in multiple blocks of output data.

Data that crosses the node processor segment boundaries will be split at the segment boundaries.

SEE PROPRIETARY NOTICE ON COVER PAGE

[3] NPMEM NPMEM FILEROP {RPCNx 0 | LNx y} a
[AP] { RPCNx 0 | LNx y }

```
NPMEM NPMEM FILEROP {RPCNx 0 | LNX y} a
n BYTES OUTPUT IN FILE - p f
```

Rop data output format.

Issue 9.4
September 2001

The rop format when RAW3B or RAW80 is the argument to the NPMEM keyword follows:

```
[4]    NPMEM NPMEM r {RPCNx 0 | LNx y} a  
      n BYTES OUTPUT IN FILE - p g
```

File data output format

The file memory or port data dump is grouped by request. All data pertaining to that request is contained within a single grouping.

The data part of the dump is preceded by a header containing a date time stamp; the type, group, and position of the node; the start address of the data dumped and the total number of bytes dumped.

The date time stamp and node type, group and position will be in ASCII. The start address, total bytes dumped and the dumped data will be in binary.

The data portion of the dump is byte ordered according to the target machine's byte ordering.

All data dump requests for a node are appended to one file (provided that the directory for file placement doesn't change). Therefore, a file can contain multiple dump requests.

The format of the file when RAW3B or RAW80 is the argument to the NPMEM keyword follows:

```
t  
[AP] {RPCNx 0 | LNx y}  
hqk
```

No data output format.

This format may be output by itself or accompany Format {1 | 2 | 3 | 4}.

```
[5]    NPMEM NPMEM STOPPED  
      e
```

2. REASON FOR OUTPUT

The NPMEM NPMEM output message is in response to the execution of the NPMEM process and provides the data dump of memory or port locations from a Node Processor (NP) or an Attached Processor (AP).

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

Where:

- a Termination code. {STARTED | IN PROG | COMPL}
- b MADDR — Node Processor memory
BPORT — Byte port
APADDR — Attached Processor memory
- x The Ring Node (RN) group number (00-63).
- y The node position in the RN group (0-15).
- c Start address in hex of the first byte of NP memory or port represented on this line.
- d Contents of the indicated byte in node memory / port in hex.
- e One of several explanations that can appear in describing the reason for stopping. Most reasons are self-explanatory. Example error output and their meaning follow:

?E — The basic format of the message appears correct, however, further checks have revealed an inconsistency and the fields in error cannot be identified. This acknowledgment is used only when system design limitations make further error isolation impractical. Additional output that can accompany the ?E output - CFTSHL UNABLE TO MATCH COMMAND X.

?I — The message contains an error in the identification field of the message. This could mean that an improper character(s) or out-of-range numeric was entered or that a field, sub-field or keyword delimiter was omitted. It may also result from an invalid association of the identification field contents with the action field.

Additional output that can accompany the ?I output - INVALID
KEYWORD: X VALID KEYWORDS: AA BB CC

- MISSING DATA FOR KEYWORD: X
- RANGE ERROR IN X; RANGE(0-X'FFFFF)
- RANGE ERROR IN X; RANGE(1-1024)
- RANGE ERROR IN X; RANGE(1 - 60)
- RANGE ERROR IN X; RANGE(0 - 15)
- RANGE ERROR IN X; RANGE NEGATIVE

 - OFL — Off-line units.
 - UNEQIP — Unequipped units.
- f Current inhibit status of the associated error source:
- ALW
 - INH
- g The results of the last diagnostic on the unit is indicated by the identifiers:
- ATP — All tests pass.
 - STF — Some test failing.
 - NTR — No tests run.
 - CATP — Conditional all tests pass.
 - ABT — Aborted diagnostics.
- h Error number:
- 9 — Cannot attach to plant measurement library.
 - 11 — Cannot open Equipment Configuration Database (ECD) sequence.
 - 12 — Cannot sequence Unit Control Blocks (UCBs).
- i Retry the command later for the reasons:
- CANNOT CREATE FILE IN /tmp
 - CANNOT GET DATABASE RECORD ID
 - CANNOT SEQUENCE DATABASE
- j Temporary output file name.
- k Key associated with write failure.

4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Process step or reason code. One of the following:
- 903 — Cannot open Equipment Configuration Database (ECD).
 - 906 — Cannot get Unit Control Block (UCB) by name.
 - 909 — Cannot reserve UCB.
 - 912 — Cannot assign special device file name.
 - 918 — Cannot set input/output mode of the device.
 - 924 — Disk read failed.
 - 925 — Invalid VTOC.
 - 930 — Failed to close special device file.
 - 933 — Failed to release special device file.
 - 936 — Failed to un-reserve UCB.
 - 939 — Failed to close ECD.
 - 942 — External signal terminated process.
- d System Error Code: see System Error Codes Appendix, APP:SYSERR.
- e Disk block number where searching for sequence number.
- f Sequence number being searched for.

4. ACTION TO BE TAKEN

Messages [1] - [7] usually indicate that a system resource was not available or became unavailable to perform the task. The problem causing the resource limitation should be cleared and the input request retried. In some instances, other UNIX® RTR error messages may be printed which may provide information pertaining to the failure encountered.

Message [8] indicates that the sequence number cannot be located using the maps. Some other method of locating the sequence number must be used. This program will not function.

Messages [9] - [12] provide information on the search.

1. FORMAT

OP ATPCM TASKS COMPLETED

TASK CONTROL BLOCK (TCB) STATUS

TCB	STATUS	PROCID	NAME	STACK	PARENT
a	X'b	X'c	X'd	X'e	X'f

2. REASON FOR OUTPUT

To report the status of ATPCM tasks.

3. VARIABLE FIELD DEFINITIONS

a Task control block (tcb) number. Possible values: 0 through 7.

b Task status. Representation of bits:

0x0	—	tcb slot is available.
0x1	—	tcb slot is in use.
0x2	—	tcb is ready to run.
0x4	—	tcb is currently running.
0x8	—	tcb is to be torn down.
0x10	—	tcb is timing.
0x20	—	tcb is starting.
0x40	—	tcb is expecting an RTR msg stimulus.
0x80	—	tcb is expecting an IMS msg stimulus.
0x100	—	tcb is expecting an INT msg stimulus.
0x200	—	tcb is expecting an ACK msg stimulus.
0x400	—	tcb is expecting user event 1.
0x800	—	tcb is expecting user event 2.
0x1000	—	tcb is expecting user event 3.
0x2000	—	tcb is waiting for death of a child task.
0x4000	—	tcb is waiting for an audit to be dispatched.

c Procedure ID. Byte representation:

First byte (leftmost) — Zero value.
Second byte — Procedure number.
Third byte — tcb number.
Fourth byte (rightmost) — Incarnation bit.

Procedure ID equal to zero implies null procedure.

SEE PROPRIETARY NOTICE ON COVER PAGE

d	Procedure name.
e	Stack address.
f	Procedure ID of the parent task. (Same as c).

- [4] OP AUD ABORTED CANNOT WRITE OUTPUT FILE s
- [5] OP AUD ABORTED CANNOT CREATE TEMPORARY FILE
- [6] OP AUD NOT STARTED
CONFLICT WITH CURRENT SYSTEM STATUS t
RETRY LATER u

2. REASON FOR OUTPUT

Prints status of the audits.

Format 1 prints the status of the audits controlled by the System Integrity Monitor (SIM).

Format 2 reports an Equipment Configuration Database (ECD) database interface error.

Format 3 reports an error when trying to create a temporary output file.

Format 4 reports an error when writing to a temporary output file.

Format 5 reports an error when unable to create a uniquely named temporary file.

Format 6 reports the termination status of the OP:AUD input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

3. VARIABLE FIELD DEFINITIONS

- a Output message status:
COMPLETED — Final or only message segment.
COMPLETED NO AUDIT RECORDS IN ECD
COMPLETED NO AUDITS RUNNING
IN PROGRESS — Second or subsequent message segment.
STARTED — First of several message segments.
- b Master audit inhibit status for all audits controlled by SIM:
ALLOWED — Not inhibited.
AUTOMATICALLY INHIBITED
IN UNKNOWN STATE
MANUALLY INHIBITED
- c Audit name. This field is blank for all instances after the first.
- d Member number. This field is blank for all instances after the first.
- e Record Identification (RID) of the audit record from the ECD. This field is blank for all instances after the first.
- f Source of the inhibit; blank if the audit is not inhibited. This field is blank for all instances after the first:
AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.
- If the inhibit source is enclosed by parentheses, it indicates that the inhibit state for the audit is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permission fields). This inhibit will not cause the audit to appear in the REPT:AUDSTAT report.
- g R if routine mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.
- h M if manual mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.
- i S if software mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.
- j D if demand mode is allowed for audit; otherwise, this field is blank. This field is blank for all instances after the first.
- k RID of the instance record from ECD.
- l Instance name. This field may be blank.

SEE PROPRIETARY NOTICE ON COVER PAGE

m Inhibit state of a given instance of the audit; blank if the audit is not inhibited:

AUTO — Automatic action.
MAN — Manual request.
??? — Unrecognized reason.

If the inhibit state is enclosed by parentheses, it indicates that the inhibit state for the instance is set. However, the inhibit has no meaning because the audit is not permitted to run in either routine or software request mode (see description for mode permissions fields). This inhibit will not cause the audit to appear in the REPT:AUDSTAT report.

n Mode in which the given instance of the audit is running, or blank if the instance is not running:

DEM — Part of a recovery sequence.
MAN — Manually requested.
RTN — Routine scheduling.
SFT — Software request.
??? — Unrecognized mode.

o Scheduling frequency of the audit:

A - H — Frequency group of audit.
T — Timed audit.
(blank) — Audit is neither timed nor routine.

p Y — This instance of the audit is blocked.

(blank) — this instance of the audit is not blocked.

If Y is enclosed in parentheses, it indicates that the audit is blocked, but the block has no meaning because the audit is not permitted to run in any mode (see description for mode permission fields). This block will not cause the audit to appear in the REPT:AUDSTAT report.

q ECD interface error number:

10 — cannot open audit record sequence
11 — cannot sequence through audit records
12 — cannot get audit record
20 — cannot open audit instance record sequence
21 — cannot sequence through instance records

r Audit RID.

s Name of temporary file.

t Explanation of error. See Audit Output Appendix C, APP:AUD-C.

u Explanation of error. See Audit Output Appendix D, APP:AUD-D.

NOTE: See Audit Output Appendixes A and B, APP:AUD-A and APP:AUD-B, for assorted parsing errors when the IM catalog is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

4. ACTION TO BE TAKEN

If Formats 1, 2, or 6 prints, use the ALW:AUD input message to allow audits which should be allowed. Use the INH:AUD input message to inhibit audits which should be inhibited. Use the STOP:AUD input message to stop audits which should be stopped.

Format 3 indicates all of the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using the CLR:FILESYS;FILE input command.

Format 4 indicates all tmp file system space has been used. Clean up unused files in the tmp file system using the CLR:FILESYS;FILE input command.

Format 5 indicates system resources do not permit the running of this command at this time; retry later. If command continues to fail, seek technical assistance.

3. VARIABLE FIELD DEFINITIONS

- a Output message status:
COMPLETED — last or only segment of message
COMPLETED NO AUDIT RECORDS IN ECD
IN PROGRESS — intermediate segment(s) of message
STARTED — first segment of message
- b Name of the audit. This field is blank for all instances after the first.
- c Member number of the audit. This field is blank for all instances after the first.
- d Instance name which may be blank.
- e Total errors found by audit since the last bootstrap. This will be blank for all error categories after the first.
- f Total errors corrected by the audit since the last bootstrap. This will be blank for all error categories after the first.
- g Error category (0-5). The error categories used by an audit are specified in its equipment configuration database ECD record. Each error category represents a different level of severity and type of recovery action. For examples, look at any of the audits and their associated Audit Error Table in the *System Maintenance Manual*.
- h Error count of the category.
- i ECD interface error number:
10 — cannot open audit record sequence
11 — cannot sequence through audit records
12 — cannot get audit record
20 — cannot open audit instance record sequence
21 — Cannot sequence through instance records.
- j Associated audit Record Identification (RID).
- k Name of temporary file.
- l Explanation of error. See Audit Output Appendix C, APP:AUD-C.

[15] OP:C7NET;SLIDTAB - PRINT THE SLID TO RNA TABLE

SLID	NODE	MAJ	MIN	FEPC	SLC	CLLI
h2	i2 j2	k2	l2	m2	n2	o2

[16] OP:C7NET COMPLETED

2. REASON FOR OUTPUT

Format 1 prints information about local subsystems. If the subsystem is in-service, the ACTINDX will reflect the FINDX. If the subsystem is either unequipped or out-of-service, CNI will put the index of one of its own functions into this entry.

Format 2 The local office's view of the status of the subsystems at a given point code and whether or not the point code is accessible.

Format 3 prints a 2x2 array of point codes used when selecting a global title translator point code. Elements [0][0] and [1][0] are the static point codes, and elements [0][1] and [1][1] are the dynamic active point codes. Under normal network conditions, these entries would be the same. If one of the STPs becomes inaccessible, then both dynamic entries would contain the point code of the other STP while the static entries would remain unchanged.

Format 4 The point codes of the two adjacent STPs are printed. Subsystems marked Normal or Backup will be listed for mated subsystems (normally in an NCP office.)

Format 5 All point codes which are contained in the permanent relations list along with the subsystems marked Normal or Backup.

Format 6 All point codes which are contained in the broadcast list. This list is not used by an end-office.

Format 16 prints when done.

3. VARIABLE FIELD DEFINITIONS

- a Subsystem number.
- b Physical address that SCCP management information is received on.
- c Logical channel that SCCP management information is received on.
- d Index into a table of functions which could be executed when a message comes into this office, c is the static function the application would would prefer to be executed.
- e Dynamic function which will actually be executed when a message comes into this office and is maintained by CNI.
- f Point code (e.g., 254254077)
- g Subsystem number.

SEE PROPRIETARY NOTICE ON COVER PAGE

h	A — Allowed.
	P — Prohibited.
i	B — Backup.
	N — Normal.
j	Link set.
k	Link set number.
l	Status of link set (NORMAL/FAILED, etc.).
m	Link set relation (LS, COMBINED LS).
n	(PART OF CLS) for regular link sets. (LSa AND LSb) for combined link sets.
o	Link type.
p	Far end point code.
q	Region.
r	Cluster.
s	Member.
t	Ring node address of the links in this set.
u	Signaling link selection. Group.
v	Group.
w	Ring node address.
x	Virtual number.
y	Point code of the cluster in hex.
z	Network.
a1	Flag field:
	CLS — Combined link set, normal.
	CLS_B — Combined link set, blocked.
	LS — Link set, normal.
	LS_B — Link set, blocked.
	NO RTE — No routing data.
	RPOPC_B — Remote populated cluster, blocked.
	RPOPC_C — Remote populated cluster, cluster routing.
	RPOPC_M — Remote populated cluster, member routing.
b1	The preferred route (link set number).
c1	The active route (link set number).

SEE PROPRIETARY NOTICE ON COVER PAGE

d1	The status (TFX) of the preferred route.
e1	The status (TFX) of the alternate route 1.
f1	The status (TFX) of the alternate route 2.
g1	The congestion level (0-3).
h1	Index in the member table.
i1	Count of abnormal members in the cluster.
j1	Internal flags.
k1	The preferred route (link set number).
l1	The active route (link set number).
m1	The congestion level (0-3).
n1	Index in the member table - blank if using cluster level routing.
o1	BRDCST Print the broadcast list.
	GTXTAB Print the global translation table.
	INTL Print internation routing information.
	LNKSET Print link set information.
	LPC Print the local point code.
	LROUTING Print long routing information.
	OFFICE Print office data.
	OPTIONS Print the options available.
	RELATE Print the permanent relations.
	RIND Print ADJ STP routing indicators.
	ROUTING Print routing information.
	ROUTING Print specific routing.
	SLIDTAB Print the SLID to RNA table.
	SSINFO Print subsystem information.
	SSSTATES Print the subsystem states for PC.
p1	Number.
q1	Index into the cNipc_data array.
r1	International point code in the format WCCCM where:
	CCC — Country code, range 0-255.
	M — Member code, range 0-7.
	W — World zone, range 2-7.

SEE PROPRIETARY NOTICE ON COVER PAGE

s1	Routing flag: CLS — Combined linkset routing. All traffic to specified point code will be load shared between the PLS and the ALS. DLS — Double linkset routing. All traffic to specified point code will go over the Primary Linkset (PLS) unless the PLS is down and then all traffic will go over the Alternate Linkset (ALS). NO — No routing defined. SLS — Single linkset routing. All traffic to specified point code will go over the Primary Linkset (PLS).
t1	Number of the primary linkset, range (1-255).
u1	Number of the alternate linkset, range (1-255).
v1	State of linkset - either INIT or blank.
w1	The number of the active linkset.
x1	State of the primary (alternate) linkset: TFA — Transfer allowed. TFC — Transfer congested. TFR — Transfer restricted. TFP — Transfer prohibited.
y1	Congestion level.
z1	Local function number (not used for CCS7).
a2	Network indicator for local point code (range 0-255).
b2	Local point code in format nnnccmmm for ANSI standard and format nnnrrcmmm for non-ANSI standard where nnn is network (range 0-255), ccc is cluster (range 0-255 for ANSI, 0-7 for non-ANSI), rr is region (range 0-31), and mmm is member (range 0-255).
c2	International point code in format wcccm where w is world zone (range 2-7), ccc is country code (range 0-255), and m is member number (range 0-7).
d2	International point code in hex format - top 3 bits world are zone, low 3 bits are member number, middle 8 bits are country code.
e2	LIS destination.
f2	Local region (non ANSI only).
g2	Local cli - 11 character office name.
h2	Slink identity.
i2	Group number of the node (00-631) .
j2	Member number of the node (1-15).

## 2. REASON FOR OUTPUT

C7NET provides a means for the craft to get a formatted display of the routing data in the cluster, member and load share tables and the timer status in the MTP restart table. This is very useful in monitoring the System 7 traffic management code that updates these tables.

Format 1 is for the PRTE option. This is the output for the network table, cNnetwork[.].

Format 2 is for the PNID option.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 is for the PRN, PREG, PCLU, and PMEM options. This is the output for the local cluster table, cNcluster[],

and the member table, cNmember[], if the local network uses the AT&T point code format (for example, PC FORMAT=AT&T).

Format 3a is for the PRN, PREG, PCLU, and PMEM options. This is the output for a nonlocal network cluster table, cNcluster[], and the member table, cNmember[], or for the local cluster and member table if the local network uses the ANSI standard point code format (for example, PC FORMAT=ANSI).

Format 4 is for the PIDX option.

Format 5 is for the PIDXPA option.

Format 6 is for the PIDXMEM option.

Format 7 is for the PFL, PFRNG options.

Format 8 is for the PLS option.

Format 9 is for the STATES option.

Format 10 is for the DEBUGON option.

Format 11 is for the DEBUGOFF option.

Format 12 is for the RIND option.

Format 13 is for the BRDCST option.

Format 14 is for the GTXTAB option.

Format 15 is for the SSINFO option.

Format 16 is for the LOCPC, ILOCPC options.

Format 17 is for the RELATE option.

Format 18 is for the PIPC, PAIPC options.

Format 19 is for the ABNORMAL option.

Format 20 is for the PMTP option. This is the output for the Message Transfer Part (MTP) restart table, cT7mtprst[].

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a The Network Identifier (NID) expressed as a hexadecimal number.
- b The Network Identifier (NID) expressed as a decimal number.
- c The network, cluster, or member level routing flag:

**NTWK** — NetworkK flag is used to identify a network with clusters of signaling points. When routing to a network with this flag, a route will be selected for Signaling Connection Control Point (SCCP) and Message Transfer Part (MTP) routing to a signaling point based on the network, cluster, and possibly, member fields of the destination point code.

**NTWK\_0** — Network Only flag is used to identify a network that has Network-Only\_Routing. When routing to a network with this flag, a route will be selected for SCCP and MTP routing to a signaling point based only on the network field of the destination point code.

**POPCLU** — A populated cluster is a group of signaling points, all of which have the same network and cluster in their point codes. The Populated Cluster flag is used to identify populated clusters. When routing to a cluster with this flag, a route will be selected for SCCP and MTP routing based on the network, cluster and if the member is exceptional (for example, a Full Point Code Routing (FPCR) member or a member that has an abnormal route status), member fields of the destination point code.

**UPOPCLU** — An unpopulated cluster is a signaling point in a network that has a unique cluster number. The Unpopulated Cluster flag is used to identify unpopulated clusters [in the NSD network, Signal Transfer Points (STPs) are unpopulated clusters]. When routing to a cluster with this flag, a route will be selected for SCCP and MTP routing based on the network, and cluster fields of the destination point code.

**SMEMBER** — Static Member flag is used to identify static members (FPCR members) of a POPCLU. When routing to a member with this flag, a route will be selected for SCCP and MTP routing based on the network, cluster, and member fields of the destination point code.

**DMEMBER** — Dynamic Member flag is used to identify dynamic members of a POPCLU. When routing to a member with this flag, a route will be selected for SCCP and MTP routing based on the network, cluster, and member fields of the destination point code.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOTE:** DMEMBER is only created as a result of network events (for example, transfer prohibits, subsystem prohibits, remote congestion, etc.) and contain the abnormal network status of the member. These members will be deleted when the abnormal status is cleared.

- NO\_RTE — No Route flag is used to identify networks, clusters, or members that do not have routing data.
- d The current/active link set (route) number or Blocked (BLK) if point code is inaccessible.
- e The primary route's link set number. The value is left blank when there is no link set associated with the primary route.
- f The route status of the first direct link set associated with the route:  
blank — No first direct link set.  
A — Transfer (cluster) allowed.  
R — Transfer (cluster) restricted.  
P — Transfer (cluster) prohibited.
- g The route status of the second direct link set associated with the route:  
blank — No second direct link set.  
A — Transfer (cluster) allowed.  
R — Transfer (cluster) restricted.  
P — Transfer (cluster) prohibited.
- NOTE:** If the route status for the first and second direct link set are both non-blank then the route's link set is a combined link set. If the route status for the first is non-blank and the second is blank then the link set is a direct link set. If both fields for the first and second are blank, then there is no link set associated with that route.
- h The first alternate route's link set number. The value is left blank when there is no link set associated with the first alternate route.
- i The second alternate route's link set number. The value is left blank when there is no link set associated with the second alternate route.
- j The remote congestion level (0-3). The value is blank when there is no remote congestion for the point code.
- k The Routing Priority Index (RPI) for the point code (0-255). However, if the RPI is 0 a blank is printed for the field. This is used internally to index into the cNrtg\_prior table.

|    |                                                                                                                                                                                                                                                                                                                                                                              |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| l  | The signaling Route Set Congestion Test (RCT). It denotes what remote congestion timer is running at the present moment:<br><br>blank — No timers are running,<br>0 — Protocol timer T15 is running,<br>1 — Protocol timer T16 is running.                                                                                                                                   |
| m  | The director index value. This value is used to index into the cluster table, cNcluster[].                                                                                                                                                                                                                                                                                   |
| n  | The local network's Network Identifier (NID) in decimal format.                                                                                                                                                                                                                                                                                                              |
| o  | The local point code in hexadecimal format.                                                                                                                                                                                                                                                                                                                                  |
| p  | The local point code format. The word "ANSI" or "AT&T" will be indicated in this field.                                                                                                                                                                                                                                                                                      |
| r  | Region from which the data is being retrieved in decimal format.                                                                                                                                                                                                                                                                                                             |
| s  | Cluster number from which the data is being retrieved in decimal format.                                                                                                                                                                                                                                                                                                     |
| t  | Member number from which the data is being retrieved in decimal format.                                                                                                                                                                                                                                                                                                      |
| u  | If the routing flag field indicates that the entry is a Populated Cluster (POPCLU), this field is used to index into the page access table, cNpage_access[]. If the data retrieved indicates that the entry is an Unpopulated (UPOPCLU) cluster or for a member (SMEMBER or DMEMBER), it is used to index into the SCCP bitmap. For all other cases the field is left blank. |
| v  | The point code translator. The format is nnncccmmm for ANSI format and nnnrrcmmm for AT&T format. These values are in decimal format.<br><br>nnn — Network ID<br>rr — Region number<br>ccc or c — Cluster number<br>mmm — Member number                                                                                                                                      |
| w  | Which translator value will be used for the next translation (0-1).                                                                                                                                                                                                                                                                                                          |
| x  | Indicates if the subsystem is equipped or unequipped.                                                                                                                                                                                                                                                                                                                        |
| y  | Indicates if the subsystem is allowed or prohibited.                                                                                                                                                                                                                                                                                                                         |
| z  | The program address physical ring node or LADD_3B in hexadecimal format.                                                                                                                                                                                                                                                                                                     |
| a1 | The channel number.                                                                                                                                                                                                                                                                                                                                                          |
| b1 | The preferred user selected function index for incoming messages.                                                                                                                                                                                                                                                                                                            |
| c1 | The active function index for incoming messages.                                                                                                                                                                                                                                                                                                                             |
| d1 | The current local point code.                                                                                                                                                                                                                                                                                                                                                |

| e1 | The Subsystem Number (SSN).                                                                                                                                                                                                                                                                                                                                                                                                                       |
| f1 | The index into the member table, cNmember[.].                                                                                                                                                                                                                                                                                                                                                                                                     |
| g1 | The SCCP bitmap index.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| h1 | The list of prohibited subsystems.                                                                                                                                                                                                                                                                                                                                                                                                                |
| i1 | <p>This field is used to indicate abnormal route status [Transfer (Cluster) Restricted or Transfer (Cluster) Prohibited] and /or alternate routing:</p> <p>&gt; — Indicates that there is an abnormal route status on any of the valid routes for that point code.</p> <p>&gt;&gt; — Indicates that alternate routing is being used for that point code. The alternate routing symbol takes precedence over the abnormal route status symbol.</p> |
| j1 | Link set number. A decimal number from 1 - 255.                                                                                                                                                                                                                                                                                                                                                                                                   |
| k1 | Point code in decimal.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| l1 | Zone.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| m1 | Country.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| n1 | Member number.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| o1 | Route (link set number). One of four routes out of the office (p0 through p3). Route p0 is attempted first and p3 is attempted last. Value is a link set number or zero (0) meaning unavailable.                                                                                                                                                                                                                                                  |
| p1 | Route status [prohibited (P), allowed (A), unavailable (U)]. Columns numbered 00 and 01 goes with route p0; 10 and 11 goes with p1, etc. 00 and 01, 10 and 11, etc. . . are a pair of either a combined link set or a direct link set route. For example, if 00 = A or P and 01 = A or P, then the route is over a combined link set. If, instead, 00 = A or P and 01 = U, then the route is over a direct link set.                              |
| q1 | Link set permutation. A decimal number from 0 to 63 representing the different possible combinations of routes p0 through p3. Link sets or point codes using the same permutation are grouped together into a link set permutation according to similar routing characteristics.                                                                                                                                                                  |
| r1 | Current route (0 to 3 for p0 to p3).                                                                                                                                                                                                                                                                                                                                                                                                              |
| s1 | Next index in hexadecimal. This is only useful to the system designer and is neither accessible nor changeable in the field.                                                                                                                                                                                                                                                                                                                      |
| t1 | Decimal number of equipped routes out of the office for this point code.                                                                                                                                                                                                                                                                                                                                                                          |
| u1 | Signaling Connection Control Part (SCCP) index. This is an index into a table containing remote subsystem status information. This is only useful to the system designer and is neither accessible nor changeable in the field.                                                                                                                                                                                                                   |
| v1 | Signaling Link Selection (SLS) field. A decimal number from 0 to 15.                                                                                                                                                                                                                                                                                                                                                                              |

|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| w1 | Link node id in decimal.                                                                                                                                                                                                                                                                                        |
| x1 | Physical address in load share table in hexadecimal format.                                                                                                                                                                                                                                                     |
| y1 | Link set description which is based on the information from the link set relation table (cNlsrel):<br><br>COMBINED LS made up of DIRECT LS (link set number)<br>and DIRECT LS (link set number)<br><br>DIRECT LS NOT part of a COMBINED LS<br><br>DIRECT LS which is part of a COMBINED LS (link set<br>number) |
| z1 | Number of links.                                                                                                                                                                                                                                                                                                |
| a2 | CNpage access entry number. The first dimension index into the cNpage_access table that is retrieved from the cNcluster table's index field.                                                                                                                                                                    |
| b2 | CNpage access mem(6) index. The second dimension index into the cNpage_access table derived from the upper six bits of the member number.                                                                                                                                                                       |
| c2 | CNmember entry number. The cNmember table entry number that is used to access into the member table routing information. This number is derived from "OR"ing the index field from the cNpage_access table that is associated with the point code with the lower order two bits of the member field.             |
| d2 | An integer or range of integers representing marked free elements for a particular table.                                                                                                                                                                                                                       |
| e2 | MTP Restart Signaling Point procedure timer status:<br><br>NOT RUNNING<br><br>RUNNING                                                                                                                                                                                                                           |

#### 4. ACTION TO BE TAKEN

Various error output messages are printed when using the C7NET command.

This tool is support use only. Contact your support organization for details.

TYPE ..... Output

## 1. FORMAT

- [1] OP:CFGSTAT MESSAGE STARTED  
UNIT MTCE INH DGN  
a b [ c d ] e f g
- [2] OP CFGSTAT COMPLETED
- [3] OP CFGSTAT INTERFACE ERROR, ERRNO=h
- [4] OP CFGSTAT NOT STARTED  
INVALID DATA FIELD
- [5] OP CFGSTAT NOT STARTED  
RETRY LATER
- [6] OP CFGSTAT IN PROGRESS  
a b [ c d ] e f g
- [7] OP CFGSTAT RETRY LATER i
- [8] OP CFGSTAT WRITE TO j  
FAILED ON KEY #k

## 2. REASON FOR OUTPUT

To give device information specific to hardware units on communities requested via the OP:CFGSTAT input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name. Unit names are listed in Member Numbers Input Appendix C, APP:MEM-NUM-C.
- b Unit number. See Member Numbers Input Appendix C, APP:MEM-NUM-C.
- c Subunit name, if subunit name is CU, Control Unit (CU) subunit names are listed in Member Numbers Input Appendix C, APP:MEM-NUM-C.
- d Subunit number. See Member Numbers Input Appendix C, APP:MEM-NUM-C.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e                   The current maintenance state of the unit is indicated by the identifiers:
- ACT     — Active units.
  - GROW    — Units being grown.
  - INIT    — Initializing units.
  - OFL     — Off-line units.
  - OOS     — Out-of-service units.
  - STBY    — Standby units.
  - UNAV    — Unavailable units.
  - UNEQIP — Unequipped units.
- f                   Current inhibit status of the associated error source:
- ALW — Allowed.
  - INH — Inhibited.
- g                   The results of the last diagnostic on the unit is indicated by the identifiers:
- ABT    — Aborted diagnostics.
  - ATP    — All tests passed.
  - CATP — Conditional all tests passed.
  - NTR    — No tests were run.
  - STF    — Some tests failed.
- h                   Error number:
- 9 — Cannot attach to plant measurement library.
  - 11 — Cannot open Equipment Configuration Database (ECD) sequence.
  - 12 — Cannot sequence Unit Control Blocks (UCBs).
- i                   Retry the message later for one of the reasons:
- CANNOT CREATE FILE IN /tmp
  - CANNOT GET DATABASE RECORD ID
  - CANNOT SEQUENCE DATABASE
- j                   Temporary output file name.
- k                   Key associated with write failure.

#### 4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

ID ..... OP:DCC  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 Rel. 4 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

- [1] OP DCC COMPLETE  
APPDB DCC IS ALLOWED FOR a
- [2] OP DCC COMPLETE  
APPDB DCC IS ACTIVATED FOR a
- [3] OP DCC COMPLETE  
APPDB DCC TASK c IS EXECUTING FOR a
- [4] OP DCC COMPLETE  
APPDB DCC IS INHIBITED FOR a
- [5] OP DCC COMPLETE  
INPUT ERROR - d
- [6] OP DCC COMPLETE  
ERROR a (LINE b) -- CANNOT DETERMINE APPDB DCC STATUS FOR a

## 2. REASON FOR OUTPUT

Response to the OP:DCC input command. Formats 1 thru 4 indicate the inhibit and activation status of DCC. Note that if a DCC task is executing, DCC is both allowed and activated. Also if DCC is activated, then it is allowed. If DCC is inhibited, it cannot be either active, allowed, or executing. Format 5 prints if a syntax error was found in the OP:DCC command that was input. Format 6 prints if internal errors are preventing the 4ESS™ Switch from obtaining status of the DCC capability.

## 3. VARIABLE FIELD DEFINITIONS

- a Error number (TBD).
- b Source line number where error was found. (For NESAC troubleshooting.)
- c Transaction ID of DCC task that is executing. The Transaction ID is specified with the START:DCC command.
- d English description of the syntax error found in the command input.

## 4. ACTION TO BE TAKEN

Format 6: Notify NESAC.

ID ..... OP:DCNAUD  
WORK CENTER.. MOC  
GENERIC ..... 4AP14 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has seven formats.

- [1] OP DCNAUD LNb c COMPLETED  
AUDIT MAN SOFT ROUT  
NUMBER MODE MODE MODE  
a d d d
- [2] OP DCNAUD a LNb c FAILED  
REASON: ACM AT INITIALIZATION
- [3] OP DCNAUD a LNb c FAILED  
REASON: INVALID AUDIT NUMBER
- [4] OP DCNAUD a LNb c FAILED  
REASON: NODE IS NOT DCHAN
- [5] OP DCNAUD a LNb c FAILED  
REASON: NODE IS NOT ACTIVE
- [6] OP DCNAUD a LNb c FAILED  
REASON: SEND MSG TO DCHAN FAILED
- [7] OP DCNAUD a LNb c FAILED  
REASON: RECEIVED \_RTNMSG OR \_SRCMATCH MSG

## 2. REASON FOR OUTPUT

To report the termination status of the OP:DCNAUD input message.

## 3. VARIABLE FIELD DEFINITIONS

- a Audit member. One of the following:
  - 1 — Data Blocks audit.
  - 2 — User call reference value (CRV) Table audit.
  - 3 — Network CRV Table audit.
  - 4 — Channel ID Table audit.
  - 5 — Idle Data Blocks List audit.
  - ALL — All D-Channel Node (DCN) audits.
- b DCN group number.
- c DCN member number.

SEE PROPRIETARY NOTICE ON COVER PAGE

d                      Audit status for all audits controlled by DCN. One of the following:

ACT — Active  
IDLE — Idle  
INH — Inhibited  
SCHE — Scheduled  
UNK — Unknown

#### 4. ACTION TO BE TAKEN

Format 1 indicates successful execution. If the audit status is UNK seek technical assistance; otherwise, no action is necessary.

Format 2 indicates that the Audit Control Mechanism on the DCN is under initialization. Wait until the DCN finishes initialization and retry.

Format 3 indicates that the audit number is not valid. Retry with a correct audit number.

Format 4 indicates that the requested node is not a DCN. Retry with a correct group and member number for the DCN.

Format 5 indicates that the DCN is not active. Wait until DCN is active and retry.

Format 6 indicates that DCNAP can not send message to the DCN. Retry. If you get the same error multiple times, seek technical assistance.

Format 7 indicates that DCNAP received a returned or source matched message. Either the IMS channel is not open on the DCN or the DCN is not active.

## 2. REASON FOR OUTPUT

To report the result of executing an OP:DFC-INFO input message.

Format 5 is output when all of the subunits of the Disk File Controller (DFC) are unequipped.

Format 6 is used to output data for a Storage Module Device (SMD) DFC.

Format 7 is used to output data for a Small Computer System Interface (SCSI) DFC equipped with only one SCSI Bus (SBUS).

Format 8 is used to output data for a SCSI DFC equipped with more than one SBUS.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a DFC member number.
- b Process step or reason code:
- f01 — Failed to enable message reception.
  - f03 — Failed to open Equipment Configuration Database (ECD).
  - f06 — Failed to get Unit Control Block (UCB) by name.
  - f08 — Failed to get top UCB.
  - f0a — Top UCB is not a DFC.
  - f0c — Unknown DFC type.
  - f0e — Failed to get UCB of SBUS.
  - f11 — Failed to assign special device file name for DFC.
  - f14 — Failed to open special device file for DFC.
  - f17 — See Disk Driver (DKDRV) report on the Read Only Printer (ROP).
  - f1a — Failed to close special device file.
  - f1c — Failed to release special device file.
  - f1f — Failed to unreserve DFC UCB.
  - f23 — Failed to get next UCB.
  - f26 — Failed to assign special device file name.
  - f29 — Failed to open special device file.
  - f2c — Failed to set Input / Output (I/O) mode of device file.
  - f2f — Device size not recognized.
  - f33 — See DKDRV report on the ROP.
  - f36 — Failed to close special device file.
  - f37 — Failed to release special device file.
  - f38 — Failed to unreserve device UCB.
  - f3e — Message to port failure.
  - f43 — Message reception failure.
  - f46 — Process timed out.
  - f49 — Failed to close special device file.
  - f4c — Failed to release special device file.
  - f4f — Failed to unreserve UCB.
  - f53 — Failed to close ECD.
  - f56 — Terminated externally with signal.
- c System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- d Major status of unit.
- e DFC firmware/pumpcode version:
- NAP — The pumpcode version is not applicable for SMD DFCs.
  - NAV — The firmware or pumpcode versions are not available, or cannot be determined.
  - A.B.C — D
- A = Version of DFC FIRMWARE/PUMPCODE.

SEE PROPRIETARY NOTICE ON COVER PAGE

B = Issue of DFC FIRMWARE/PUMPCODE.

C = Point issue of DFC FIRMWARE/PUMPCODE.

D = Laboratory Design Issue (LDI) of DFC  
FIRMWARE/PUMPCODE.

- f Unit name and member number.
- g Device ID (drive ID number).
- h Physical port where the SMD disk drive is connected to the DFC:  
NAV — The DFC is not available, or the DFC is reserved, or the  
SMD DFC firmware/pumpcode version is earlier than 3.2.0.  
data — Physical port number.
- i Number of tracks on the SMD disk drive:  
NAV — DFC is not available, or the unit is reserved.  
data — Decimal number of disk tracks.
- j Validity of the Volume Table Of Contents (VTOC):  
INVALID — Could not find a valid VTOC entry.  
NAP — Not applicable for this device.  
NAV — Could not reserve unit - VTOC not read.  
UNRDBLE — Read error while trying to read VTOC.  
VALID — VTOC has a valid VTOC entry.
- k Usability:  
NAP — Not applicable for this device.  
NO — Disk data integrity is unknown.  
YES — Disk is considered usable.
- l Unit reserved:  
NO — Unit is not reserved.  
YES — Unit is reserved for maintenance activity.
- m Unit essential:  
NAP — Not applicable for this device.  
data — Hexadecimal value of the essential field of the unit's UCB.
- n Unit's mate:  
NAP — Not applicable for this device.  
SMPLX — Unit has no mate.  
data — Unit name and member number of duplex mate.

SEE PROPRIETARY NOTICE ON COVER PAGE

- o** Equipage size based on the physical disk drive. For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record:
- 160MB — (SMD disk drive)
  - 300MB — (SMD disk drive)
  - 322MB — (SCSI disk drive)
  - 340MB — (SMD disk drive)
  - 600MB — (SCSI disk drive)
  - 1000MB — (SCSI disk drive)
  - 2000MB — (SCSI disk drive)
  - NAP — Not applicable for this device.
  - NAV — The DFC is not active, or the SCSI device is inaccessible, or the unit is reserved.
- p** Equipage size based on the UCB equipage value. The disk drive size is determined by reading the equipage value in the UCB record for the unit:
- 160MB — (SMD disk drive)
  - 300MB — (SMD disk drive)
  - 322MB — (SCSI disk drive)
  - 340MB — (SMD disk drive)
  - 600MB — (SCSI disk drive)
  - 1000MB — (SCSI disk drive)
  - 2000MB — (SCSI disk drive)
  - NAP — Not applicable for this device.
  - NAV — The DFC is not active, or the unit is reserved.
- q** Equipage size based on the VTOC. The drive size is derived from the maximum capacity of the unit's VTOC:
- 160MB — (SMD disk drive)
  - 300MB — (SMD disk drive)
  - 322MB — (SCSI disk drive)
  - 340MB — (SMD disk drive)
  - 600MB — (SCSI disk drive)
  - 1000MB — (SCSI disk drive)
  - 2000MB — (SCSI disk drive)

SEE PROPRIETARY NOTICE ON COVER PAGE

NAP — Not applicable for this device.

NAV — The DFC is not active, or the unit is reserved, or the unit is inaccessible.

r Sizes compatible.

NAP — Not applicable for this device.

NAV — At least one of the equipage sizes are not available.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size. Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are:

| Drive  | Formatted Capacity |
|--------|--------------------|
| 160MB  | 133MB              |
| 300MB  | 253MB              |
| 322MB  | 322MB              |
| 340MB  | 277MB              |
| 600MB  | 604MB              |
| 1000MB | 1000MB             |
| 2000MB | 2000MB             |

s SBUS unit number if the DFC is a SCSI device. Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

t SCSI Host Adapter (HA) bus identification number (0-1).

u Device type.

v Product identification:

NAP — Not applicable for this device.

NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

data — Alphanumeric data representing the product identification of a SCSI device.

w Revision level:

NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.

data — Alphanumeric data representing the revision level of the firmware in a SCSI device.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                          |
|---|----------------------------------------------------------------------------------------------------------|
| x | Serial number:                                                                                           |
|   | NAP — Not applicable for this device.                                                                    |
|   | NAV — The DFC or the SBUS is not active, or the unit is reserved,<br>or the SCSI device is inaccessible. |
|   | data — Alphanumeric data representing the serial number of a<br>SCSI device.                             |

#### 4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated DFC is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 6, 7, and 8, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

## 5. REFERENCES

## OMDB Keys

Formats 1 through 4 have an OMDB key of 153.

Format 5 has an OMDB key of 152.

Format 6 has an OMDB key of 150.

Format 7 has an OMDB key of 570.

Format 8 has an OMDB key of 571.

## 2. REASON FOR OUTPUT

Formats 2 through 6 report that an Equipment Configuration Database (ECD) call failed.

Format 7 reports that the Storage Module Device (SMD) Moving Head Disk (MHD) ID plug number does not match the ID plug number in the ECD records.

Format 8 reports that the ID switch number on the SCSI device does not match the ID switch number in the ECD records.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 9 through 15 report that the User Control String (UCS) portion of the DFCELOG entry is corrupted.

Formats 16 through 19 report that the text portion of the DFCELOG entry is corrupted.

Formats 20, 21, 22, and 23 report and format the Enhanced Information Report (EIR) entries in the disk driver logfile.

See REPT:DFCE and REPT:DFCI output messages for the displayed codes.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                               |
|---|-----------------------------------------------------------------------------------------------|
| a | Name of the disk driver logfile.                                                              |
| b | MHD or SCSI MT member number.                                                                 |
| c | Number of the segment being generated.                                                        |
| d | Time stamp.                                                                                   |
| e | Data flags.                                                                                   |
| f | Drive table status word 0.                                                                    |
| g | Drive table status word 1.                                                                    |
| h | Identification plug number.                                                                   |
| i | Completion codes.                                                                             |
| j | Enhanced codes.                                                                               |
| k | Disk status register.                                                                         |
| l | Starting cylinder of current job.                                                             |
| m | Starting head of current job.                                                                 |
| n | Starting sector of current job.                                                               |
| o | Number of sectors in current job.                                                             |
| p | Current cylinder.                                                                             |
| q | Current head.                                                                                 |
| r | Current sector.                                                                               |
| s | Completion code. See output Disk File Controller (DFC) Appendix B, APP:DFC-B, Tables 1 and 2. |
| t | Number of blocks read on short failure of read command.                                       |
| u | Device ID number.                                                                             |
| v | Autonomous completion code. See output DFC Appendix B, APP:DFC-B, Table 3.                    |
| w | Job ID number.                                                                                |
| x | Device status word.                                                                           |

| m1 | Failed command words 1-4.                                                                                           |
| n1 | Extended sense data 1-4.                                                                                            |

#### 4. ACTION TO BE TAKEN

If Format 1 is printed, check to see if the logfile exists under /etc/log.

The contents of the corrupted logfile must be SAVED on paper and/or tape for later reference. The corrupted logfile should be removed by using the CLR:F-FILE input message, and terminate the Spooler Output Process (SOP) for the logfile.

**NOTE:** Depending on the severity of the corruption, the message may or may not continue processing.

## 1. FORMAT

- [1] OP DLNAUD  
REHASH AUDIT IS a FOR APP b
- [2] OP DLNAUD  
CANNOT GIVE INHIBIT STATUS OF INVALID APP c

## 2. REASON FOR OUTPUT

Print the status of application database audits.

## 3. VARIABLE FIELD DEFINITIONS

- a Status of audit:
- ALLOWED
- INHIBITED
- b Application database that is affected. Valid values are:
- IBGTT — Inbound global title translation
- PCPGTT — Positive call processing global title translation
- ATP — AT&T Trigger Platform (ATP) data tables
- c Invalid application database. Valid values are 0 (for IBGTT), 2 (for PCPGTT), or 3 (for ATP).

## 4. ACTION TO BE TAKEN

Inhibit or allow the audit if appropriate via the INH:DLNAUD or ALW:DLNAUD command.

## 5. REFERENCES

## 1. FORMAT

OP DLNCM BINKMAP COMPLETED

OWNER: ab    MAP CONTENTS(X'):

| BINK | DATA 1 | DATA 2 | DATA 3 | DATA 4 | DATA 5 |
|------|--------|--------|--------|--------|--------|
| c    | d      | e      | f      | g      | h      |

## 2. REASON FOR OUTPUT

To report the status and contents of the bink map.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Procedure id of procedure using the bink map. Byte representation:
- First byte (leftmost) — Zero value.  
Second byte — Procedure number.  
Third byte — TCB number.  
Fourth byte (rightmost) — Incarnation bit.  
Procedure id equal to zero implies null procedure.
- b                      Procedure name.
- c                      Bink number (positive integer).
- d through h          Bink representation.
- Each byte represents a bink and each bit represents a 128 word (512 byte) block per bink. The rightmost byte is the low order bink, e.g., bink 0 is the rightmost byte in data word 1. DLN updates and audits use the bink map to record changes and errors, respectively.

## 4. ACTION TO BE TAKEN

### 1. FORMAT

OP DLNCM IMSCHAN COMPLETED

IMS CHANNEL STATUS

| CHAN NAME | NUMBER | STATUS | COUNT | READ | PROCID | NAME |
|-----------|--------|--------|-------|------|--------|------|
| a         | b      | c      | d     | e    | f      | g    |

### 2. REASON FOR OUTPUT

To report the status of the API -DLN stream.

### 3. VARIABLE FIELD DEFINITIONS

- a IMS /CNI channel name. Possible values:
- DLNUZRCHN — DLN user channel.
  - DLNERRCHN — DLN error channel.
  - DLNAUDCHN — DLN audit channel.
  - DLNPANICHN — DLN panic channel.
- b IMS /CNI channel number
- c Status of channel.
- OPEN — Channel is open.
  - CLOSE — Channel is closed.
- d Number of messages received.
- e Status of reads. Possible values:
- NACT — No reads pending.
  - ACT — Read pending.
- f Procedure id of procedure with pending read. Byte representation:
- First byte (leftmost) — Zero value.
  - Second byte — Procedure number.
  - Third byte — TCB number.
  - Fourth byte (rightmost) — Incarnation bit.
- Procedure id equal to zero implies null procedure.
- g Procedure name.

SEE PROPRIETARY NOTICE ON COVER PAGE

**4. ACTION TO BE TAKEN**

If channels are not open and ring initialization or start traffic sequence is not in progress, request CNI phase 1.

OP DLNCM TASKS COMPLETED

TASK CONTROL BLOCK (TCB) STATUS

| TCB | STATUS | PROCID | NAME | STACK | PARENT |
|-----|--------|--------|------|-------|--------|
| a   | X'b    | X'c    | X'd  | X'e   | X'f    |

## 2. REASON FOR OUTPUT

To report the status of DLNCM tasks.

## 3. VARIABLE FIELD DEFINITIONS

- a Task control block (tcb) number. Possible values: 0 through 7.
- b Task status. Representation of bits:
- 0x0 — tcb slot is available.
  - 0x1 — tcb slot is in use.
  - 0x2 — tcb is ready to run.
  - 0x4 — tcb is currently running.
  - 0x10 — tcb is to be torn down.
  - 0x20 — tcb is timing.
  - 0x40 — tcb is starting.
  - 0x80 — tcb is expecting a RTR msg stimulus.
  - 0x100 — tcb is expecting a IMS msg stimulus.
  - 0x200 — tcb is expecting a DLN cmd stimulus.
  - 0x400 — tcb is waiting for death of a child task.
  - 0x800 — tcb is waiting for an audit to be dispatched.
- c Procedure id. Byte representation:
- First byte (leftmost) — Zero value.
  - Second byte — Procedure number.
  - Third byte — tcb number.
  - Fourth byte (rightmost) — Incarnation bit.
- Procedure id equal to zero implies null procedure.
- d Procedure name.
- e Stack address.
- f Procedure id of the parent task. (same as c).

## 1. FORMAT

This message has six formats:

- [1] OP DMSORDERS COMPL  
TMP FILE (a) CREAT FAIL  
ERRNO b(c)
- [2] OP DMSORDERS COMPL  
TMP FILE (a) WRITE FAIL  
ERRNO b(c)
- [3] OP DMSORDERS COMPL  
ERROR OPENING DMS STATUS FILE a  
ERRNO b(c)
- [4] OP DMSORDERS COMPL  
STAT FILE (a) READ FAIL  
ERRNO b(c)
- [5] OP DMSORDERS COMPL  
dddddddddddd eeeee ffffffff g ... g  
.  
.  
.  
dddddddddddd eeeee ffffffff g ... g
- [6] OP DMSORDERS COMPL  
NO f ORDERS FOUND

## 2. REASON FOR OUTPUT

To report the termination status of the OP:DMSORDERS input command.

This message is generated automatically after every RING initialization reaches a terminal condition (see INIT:RING input message) to report DMS orders that were INCORE only. Orders that were INCORE only are lost and have to be resubmitted. Automatic reports of lost INCORE DMS changes have a minor alarm associated with the output message.

## 3. VARIABLE FIELD DEFINITIONS

- a File name of a temporary file or the DMS system status file.
- b System error number (errno) (refer to System Error Codes Output Appendix, APP:SYSERR).

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Description of the system error number (sys\_errlist) (refer to System Error Codes Output Appendix, APP:SYSERR).
- d 12-character DMS order number.
- e 6-character DMS function name. Possible values are:
- cevent — Changes the CNI critical event table.
  - clsrout — Controls combined linkset routing associated with a cluster.
  - except — Changes information in the CNI measurement exception table.
  - histfd — Changes information in the CNI measurement history table.
  - lkdata — Manages CNI link configuration information.
  - lkinfo — Used by remote administration to manage CNI link configuration information.
  - lsrout — Changes linkset routing information.
  - ofdata — Changes data describing the office.
  - schedl — Manages information in the CNI measurement schedule table.
  - setrna — Verify only.
  - vuname — Controls information in the CNI measurement User View Descriptor Table.
- f Status of the DMS order. Possible values are:
- ACTFAILED — The order has failed activation. See the DMS error log for failure reasons.
  - ACTIVATED — The order exists in core and on disk.
  - INCORE — The order exists incore only and has not been backed up on disk. Orders in this state can be lost during RING initializations 3 or 4.
  - PENDING — Orders not in any other state are in this state.
- g 40-character comment field associated with the DMS order.

#### 4. ACTION TO BE TAKEN

If INCORE DMS orders have been lost due to RING initializations, steps must be taken to restore the changes. Else the RING sub-system may not perform message transport duties correctly.

## 1. FORMAT

- [1] OP EMERSTAT COMPLETED  
EMERGENCY DUMP PARTITION IS EMPTY
  
- [2] OP EMERSTAT COMPLETED  
EMERGENCY DUMP PARTITION IS FULL  
TIME OF EMERGENCY DUMP: a b c d e  
BOOT DEVICE LOADED = f  
g BYTES OF MAIN MEMORY WERE DUMPED  
FROM THE FOLLOWING SEGMENTS:  
    ADDRESS    LENGTH  
    X'hhhhhhh  X'iiiiiii
  
- [3] OP EMERSTAT COMPLETED  
{FOPEN|FREAD|FSEEK|REWIND} OF PANIC DUMP PARTITION FAILED: ERRNO = j
  
- [4] OP EMERSTAT COMPLETED  
PDMPFULL FLAG IN LOW CORE IS NOT SET  
TIME OF LAST DUMP: k

## 2. REASON FOR OUTPUT

To report the status of the emergency dump partition in response to an OP:EMERSTAT input message.

## 3. VARIABLE FIELD DEFINITIONS

- a                Day of the week.
- b                Month of the year.
- c                Day of the month.
- d                Time of day.
- e                Year.
- f                Unit number of the disk the dump was written on.  
                  0 — MHD 0.  
                  1 — MHD 1.

**NOTE:** If a disk restoral has been performed, the data reside on both disks.

- g                Total number of bytes written into the emergency dump partition on MHD listed.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                                                                                                                              |
|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| h | Address. For each segment, bits 30 and 31 represent status information, and the remaining bits represent the physical address. If set, bit 30 indicates that all data was dumped; bit 31 indicates the segment was accessed. |
| i | Number of bytes written from address given.                                                                                                                                                                                  |
| j | Error number.                                                                                                                                                                                                                |
| k | ASCII string indicating time and date when last panic dump occurred.                                                                                                                                                         |

#### **4. ACTION TO BE TAKEN**

For Formats 1 and 3, no action is required.

For Format 2, use the **COPY:T-EMERDMP** input message to copy the data to magnetic tape, and the **CLR:EMERDMP** input message to clear the emergency dump partition status flag. Send the tape and this printout to a technical assistance center for analysis.

For Format 4, use the **COPY:T-EMERDMP** input message to copy the data to magnetic tape. Send the tape and this output message to a technical assistance center for analysis.

- [4] OP ERRCHK NOT STARTED  
INVALID ID FIELD

## 2. REASON FOR OUTPUT

To indicate the inhibit status of all computer error conditions that may be optionally inhibited or allowed. The error conditions of this type are:

1. Hardware checks identified by HDWCHK,
2. Software checks identified by SFTCHK,
3. Error interrupts identified by ERRINT,
4. Control Unit (CU) pseudo-nodes identified by ERRSRC,
5. Emergency Action Interface (EAI) error interrupts from CU 0 identified by EAIINT CU 0, and
6. EAI error interrupts from CU 1 identified by EAIINT CU 1.

**NOTE:** The 3B20D/3B21D computer CUs do not have EAI error interrupts.

The report lists each error condition and its associated inhibit state. In the case of inhibited Error Interrupts (ERRINT), a supplemental report is output which then lists all units that are inhibited. Information specific to each device is output in a format consistent with related maintenance messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful ABORTED message.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 1. FORMAT

- [1] OP FNAME a  
b NAME  
c d
- [2] OP FNAME ABORTED CANNOT OPEN OUTPUT FILE e
- [3] OP FNAME ABORTED CANNOT WRITE OUTPUT FILE e
- [4] OP FNAME ABORTED CANNOT CREATE TEMPORARY FILE
- [5] OP FNAME NOT STARTED  
RETRY LATER f

## 2. REASON FOR OUTPUT

Format 1 prints the full path names of files.

Format 2 reports an error when trying to create a temporary output file.

Format 3 reports an error when writing to a temporary output file.

Format 4 reports an error when unable to create a uniquely-named, temporary file.

Format 5 reports an aborted OP:FNAME command with an explanation.

## 3. VARIABLE FIELD DEFINITIONS

- a Output message status:
  - COMPLETED — Last or only segment of message.
  - IN PROGRESS — Intermediate segment(s) of message.
  - STARTED — First segment of message.
- b Search type:
  - BLOCK — The check for matches was made on block numbers.
  - INODE — The check for matches was made on i-nodes.
- c Inode or first block number on which the match occurred.
- d Full path name on which the match occurred.
- e Name of temporary file.
- f Explanation of error. See the OP-FNAME Output Appendix, APP:OP-FNAME.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

If Format 1 prints, no action is needed.

Format 2 indicates all of the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using input message CLR:F-FILE.

Format 3 indicates all tmp file system space has been used. Clean up unused files in the tmp file system using input message CLR:F-FILE.

Format 4 indicates system resources do not permit the running of this command at this time; try again later. If the command continues to fail, seek technical assistance.

If Format 5 prints, action is dependent upon the error given.

- [8] OP FTA APP a COMPLETE  
FTA IS ALLOWED FOR a - TRANSFER AND ACTIVATION STILL IN PROGRESS
- [9] OP FTA APP a COMPLETE  
INPUT ERROR - b
- [10] OP FTA APP a COMPLETE  
ERROR c (LINE d) -- CANNOT DETERMINE FTA STATUS FOR a

## 2. REASON FOR OUTPUT

Response to the File Transfer and Activation (FTA) OP:FTA input command. Formats 1 through 4 indicate that the FTA capability is inhibited. If FTA is inhibited, file transfers and activations will not be permitted. (Further work on pending transfers and/or activations will also not be permitted.) Formats 5 through 8 indicate that the FTA capability is allowed, and either transferring or activating or both). Format 9 prints if a syntax error was found in the OP:FTA command that was input. Format 10 prints if internal errors are preventing the 4ESS™ Switch from obtaining status of the FTA capability.

**NOTE:** If the APP keyword argument was not specified in the corresponding IM message, the preceding formats will be slightly different. An Output Message

SEE PROPRIETARY NOTICE ON COVER PAGE

will print, with "IN PROGRESS" on the first line instead of "COMPLETE", for each application programmed for FTA. A final "COMPLETE" message will print concluding the Output Message sequence. For example, instead of format 1 preceding, the output will be:

OP FTA IN PROGRESS  
APPDB FTA IS ALLOWED FOR IBGTT

OP FTA IN PROGRESS  
APPDB FTA IS ALLOWED FOR OBGTT

OP FTA IN PROGRESS  
APPDB FTA IS ALLOWED FOR CORE

OP FTA COMPLETE

- [2] OP FTF APP a COMPLETE  
NO FILES FOR THIS APPLICATION
- [3] OP FTF APP a COMPLETE  
INPUT ERROR - b
- [4] OP FTF APP a COMPLETE  
ERROR c (LINE d) PRINTING FILE DATA

### 2. REASON FOR OUTPUT

Response to the File Transfer and Activation (FTA) OP:FTF input command. Normally, one or more format 1's will be output containing size and status information for each of the requested FTA customer application's FTA command and response files that exist in the customer application's FTA directory. Format 2 prints if the requested FTA customer application does not have files in its FTA directory. Format 3 prints if a syntax error was found in the OP:FTF command that was input. Format 4 prints if internal errors are preventing the 4ESS™ Switch from obtaining status on the given customer application's FTA files.

### 3. VARIABLE FIELD DEFINITIONS

- a The customer application for which FTF status is being output. Either:  
IBGTT  
OBGTT (Refers to the PCP customer)  
CORE
- b English description of the syntax error found in the command input.
- c Error number (TBD).
- d Source line number where error was found. (For NESAC trouble-shooting.)

## 2. REASON FOR OUTPUT

To print the contents of the system update event log.

Format 1 indicates that output of the system update event log has been completed.

Format 2 indicates that output of the system update event log has been stopped due to error. The error is identified.

Format 3 displays the FIRST log entry, including the number of entries in the log.

Format 4 displays a BEGIN log entry indicating that an identified system update process began the update method in use, the mode of execution and the Process Identification (PID) of the update process, and the date and time that the entry was made.

Format 5 displays a BEGIN log entry for an ENTER process, which includes all the information in Format 4 as well as the pathname of the input file (normally a magnetic-tape device), the pathname of each Volume Table Of Contents (VTOC) on each disk pair being updated, the unit number of the Disk File Controller (DFC) for each new-generic disk (if one was specified), and the tape sequence options used to update the specified disks. Also included is the pathname of the Equipment Configuration Database (ECD) which will be accessed in the new generic, the partition in which this ECD will reside, the pathname of the system update log in the new generic, and the partition in which this log will reside. Also included is the PID of the update process, and the date and time of the log entry.

Format 6 displays a DISK entry for the Backup Partition (BKPRT) update method indicating the type of update process that began updating a disk pair, the name of the VTOC on this disk pair, the PID of the update process, and the date and time that the entry was made.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 displays a Disconnect (DISK) entry for the Off-Line Disk (OFLDISK) update method indicating the type of process that began updating a disk, the disk that was to contain (or contained) the new generic, and its mate, the disk that contained the old generic. Also included is the PID of the update process, and the date and time of the log entry.

Format 8 displays a WRITE entry indicating that an ENTER process began to update a partition, which partition was being updated, and its backup partition (if one exists). Also, the PID of the update process and the date and time of the log entry are included.

Format 9 displays a TAPE entry indicating that an ENTER process was ready to read a tape, the sequence number of the tape expected, the System Generation (SG) -database ID (time stamp) expected from the tape, the generic-version number expected from the tape, and an indication of whether the tape is in the first or second sequence for the disk-pair. Also included is the process ID of the update process, and the date and time of the log entry.

Format 10 displays an APPLHOOK entry indicating the type of update process that initiated application-dependent processing, the PID of the update process, and the date and time of the log entry.

Format 11 displays an UPDATE entry indicating that the ENTER process is updating the backup partitions, the PID of the update process, the backup partition number being updated, and the date and time of the log entry.

Format 12 displays a CONTINUE entry indicating the type of update process that restarted execution, the PID of the update process, and the date and time of the log entry.

Format 13 displays an END entry indicating that the execution of an update process ended (and the process type), whether the system was booted on primary or backup root, appdmert or dmert (the latter is MIN\_CONFIG on the EAI), and for the off-line disk method the boot disk (Moving Head Disk [MHD] 0 or 1). Also included are whether the process completed successfully or failed, the error code, an error number set by a UNIX® system call or DMERT interface function, the PID of the update process, and the date and time of the log entry.

Formats 14 and 15 indicate that an error was made when entering the input message.

**NOTE:** The log is normally emptied when a COMMIT or RESTORE process succeeds.

**NOTE:** Two of these formats may appear in succession with OP:G-READLOG printed only once.

### 3. VARIABLE FIELD DEFINITIONS

- a Error code for failing process, or the reason the process stopped; 0 implies success. The error code is output at the time the process is run. See the System Error Codes Output Appendix, APP:SYSERR.
- b Number of event entries in the system update log.

|   |                                                                                                                                                                                                                                         |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c | Process ID associated with the log entry.                                                                                                                                                                                               |
| d | Date stamp; indicates when the log entry was made.                                                                                                                                                                                      |
| e | Pathname of the input file, as specified in the UPD:G-ENTER input message.                                                                                                                                                              |
| f | Destination VTOC pathname(s) for subsequent write entries.                                                                                                                                                                              |
| g | Sequence options used for the specified destinations.                                                                                                                                                                                   |
| h | Pathname of the ECD to be accessed in the new generic.                                                                                                                                                                                  |
| i | Partition number of the partition in which the ECD will reside.                                                                                                                                                                         |
| j | Pathname of the system update log in the old generic.                                                                                                                                                                                   |
| k | Partition number of the partition in which the system update log of the old generic resided.                                                                                                                                            |
| l | Pathname of the system update log in the new generic.                                                                                                                                                                                   |
| m | Partition number of the partition in which the system update log will reside.                                                                                                                                                           |
| n | Number, in order of updating, of the disk pair being updated.                                                                                                                                                                           |
| o | Member number of the disk containing the new generic; associated with subsequent write entries (off-line disk method only).                                                                                                             |
| p | Member number of the duplexed disk containing the old generic; mate for MHD a (off-line disk method only).                                                                                                                              |
| q | Partition number of the partition written.                                                                                                                                                                                              |
| r | Partition number of the partition paired with a, if one exists; 0 implies that no backup to a exists.                                                                                                                                   |
| s | Sequence number of the tape.                                                                                                                                                                                                            |
| t | SG database unique ID (time stamp).                                                                                                                                                                                                     |
| u | Generic and version number of the new generic.                                                                                                                                                                                          |
| v | Backup partition number being updated.                                                                                                                                                                                                  |
| w | Internal error code generated by a system update process. See the System Update Error Codes Appendix, APP: SUPR.                                                                                                                        |
| x | Error number set by a failed UNIX® system call or DMERT interface function (which usually results in process failure); 0 implies success of all system calls (some DMERT functions set this number to non-zero values even on success). |

## 1. FORMAT

- [1] OP GROW MESSAGE STARTED  
UNIT MTCE INH DGN  
a b [ c d ] e f g
- [2] OP GROW COMPLETED
- [3] OP GROW INTERFACE ERROR, ERRNO=h
- [4] OP GROW NOT STARTED  
INVALID DATA FIELD
- [5] OP GROW NOT STARTED  
RETRY LATER
- [6] OP GROW IN PROGRESS  
a b [ c d ] e f g
- [7] OP GROW RETRY LATER i
- [8] OP GROW WRITE TO j  
FAILED ON KEY #k

## 2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:GROW input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name. Computer unit names are listed in the Member Numbers Output Appendix C, APP:MEM-NUM-C.
- b Unit number. See the Member Numbers Output Appendix C, APP:MEM-NUM-C.
- c Subunit name, if subunit name is CU, CU subunit names are listed in the Member Numbers Output Appendix D, APP:MEM-NUM-D.
- d Subunit number. See the Member Numbers Output Appendix C, APP:MEM-NUM-C.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e The current maintenance state of the unit is indicated by the identifiers:
- ACT — Active units
  - GROW — Units being grown
  - INIT — Initializing units
  - OFL — Offline units
  - OOS — Out-of-service units
  - STBY — Standby units
  - UNAV — Unavailable units
  - UNEQIP — Unequipped units
- f Indicates the current inhibit status of the associated error source:
- ALW — Allowed
  - INH — Inhibited
- g Results of the last diagnostic on the unit:
- ABT — Aborted diagnostics
  - ATP — All tests passed
  - CATP — Conditional all tests passed
  - NTR — No tests were run
  - STF — Some tests failed
- h Error number:
- 9 — Cannot attach to plant measurement library.
  - 11 — Cannot open Equipment Configuration Database (ECD) sequence.
  - 12 — Cannot sequence Unit Control Blocks (UCBs).
- i Retry the command later for the reasons:
- CANNOT CREATE FILE IN /tmp
  - CANNOT GET DATABASE RECORD ID
  - CANNOT SEQUENCE DATABASE
- j Temporary output file name.
- k Key associated with write failure.

#### 4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

WORK CENTER.. MOC  
GENERIC ..... 4AP13 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has eight formats.

- [1] OP INH APPDB  
DLN INHIBIT ACTIVE
- [2] OP INH APPDB  
DLN INHIBIT INACTIVE
- [3] OP INH APPDB -  
RL - CANNOT CONNECT TO DATABASE
- [4] OP INH APPDB  
CANNOT TALK TO DATABASE
- [5] OP INH APPDB  
NO RCV MANUAL INHIBITS ACTIVE
- [6] OP INH APPDB  
PCPGTT INHIBIT ACTIVE
- [7] OP INH APPDB  
IBGTT INHIBIT ACTIVE
- [8] OP INH APPDB  
ATP INHIBIT ACTIVE

## 2. REASON FOR OUTPUT

These output messages are printed in response to the OP:INH-APPDB input message.

Format 1 indicates that the "DLN Inhibit" feature is active. GTT10D RCV is NOT allowed.

Format 2 indicates that the "DLN Inhibit" feature is NOT active. GTT10D RCV is allowed.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

If Format 3 prints, the input message cannot establish a communication link with the RCV process. Probable cause: the RCV process does not exist or insufficient system resources are available for the operation. Wait and retry later.

SEE PROPRIETARY NOTICE ON COVER PAGE

If Format 4 prints, the input message has established a communication link with the RCV process, however no data can be sent or received. Probable cause: the RCV process has a software problem or insufficient system resources are available for the operation. Wait and retry later. If the problem does not clear, notify NESAC.

If Format 5 prints, then there are no GTT10D RC manual inhibits currently active.

If Format 6 prints, then there is currently a GTT10D RC manual inhibit on the PCPGTT (PCP GTT) portion of the database.

If Format 7 prints, then there is currently a GTT10D RC manual inhibit on the IBGTT (800 and 900 services) portion of the database.

If Format 8 prints, then there is currently a manual inhibit on the ATP (AT&T Trigger Platform) portion of the database.

#### 4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered. If any unit of the associated IOP is reserved, however, certain fields will contain information that is not available. For more complete information, try the message again after the unit is released.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

## 2. REASON FOR OUTPUT

Format 1 reports intermediate results in response to input message OP:LFS.

Format 2 reports the customized loopback test attributes, in response to the input command OP:LFS (with DEFAULTS option).

## 3. VARIABLE FIELD DEFINITIONS

- a Link group number (0-63).  
b Link member number (1-15).

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Number of loopback components specified in the EXC:LFS command line.
- TEST sequence progression specifier:
- NEAR — Indicates link fault sectionalization (LFS) test started from the nearest specified loopback component to the farthest.
- FAR — Indicates LFS test started from the farthest specified loopback component to the nearest.
- e Loopback point to which the test sequence has progressed. Must be one of the following:
- CSUL — Channel service unit (CSU) latching loopback.
- CSUN — Channel service unit (CSU) non-latching loopback.
- DPuu — Indicates the uuuth digital signal zero (DS0) data port relative to the near-end. The uu is a number in the range: (01-50).
- DSUL — Data service unit (DSU) data port latching loopback.
- DSUN — Data service unit (DSU) non-latching loopback.
- LID0 — Indicates test sequence has not progressed beyond the local loopback test.
- NEI — Far-end network element interface. (Loopback select code octet value = x1000001).
- OCUL — Office channel unit (OCU) latching loopback.
- OCUN — Office channel unit (OCU) non-latching loopback.
- REM — Manual remote loopback.
- RPT1 — Represents non-latching loopback test for the first 56K bps local loop regenerative repeater.
- RPT2 — Represents non-latching loopback test for the second 56K bps local loop regenerative repeater.
- f Repetitive (>1) or single (1) operation. Must be a value in the range: (1-99).
- 1 — Indicates 1st operation of the loopback component.
- 2 — Indicates the 2nd operation of a unique loopback component.
- g Individual evaluations of loopback tests.
- PASS — Indicates a successful test based on input criteria.
- FAIL — Indicates test failure based on input criteria.
- TINP — Indicates the designated LC is being tested.

SEE PROPRIETARY NOTICE ON COVER PAGE

- h Elapsed duration of measurement for individual loopback points in hours:minutes:seconds respectively.
- i Number of errored bits for this LC (0 to 65535).
- j Number of errored seconds for this loopback point (0 to 9999).
- k Bit error ratio (BIT-ERT) for this loopback point. Expressed as one of the following:

—  $x.yE-z$

— UNFLW to indicate underflow.

— OVFLW to indicate overflow.

Where  $x$ ,  $y$  and  $z$  are integer values in the range: (0-9).

**NOTE:** The BIT-ERT and PCT E-F-S values in an intermediate report could be worse than the specified threshold, but the test will not necessarily fail (yet). This is due to a difference in the way calculations are done for reporting vs. thresholding. For example, the reported BIT-ERT is calculated by dividing the number of errored bits by the total number of bits from the start of the test up to the time of the calculation (elapsed time). For thresholding, the denominator is always the number of bits for the entire specified duration. Thresholding is done in this way so that the test is not overly sensitive to bit errors early in a long test.

- l Percent error free seconds (PCT E-F-S) for this LC. Also represented as a fixed point with precision = 0.1%.

**NOTE:** The BIT-ERT and PCT E-F-S values in an intermediate report could be worse than the specified threshold, but the test will not necessarily fail (yet). This is due to a difference in the way calculations are done for reporting vs. thresholding. For example, the reported BIT-ERT is calculated by dividing the number of errored bits by the total number of bits from the start of the test up to the time of the calculation (elapsed time). For thresholding, the denominator is always the number of bits for the entire specified duration. Thresholding is done in this way so that the test is not overly sensitive to bit errors early in a long test.

- m Number of lost synchronization for the loopback point (0 to 999).
- n Memory location for customized default attributes. Must be a value in the range: (1-50).
- o Latching pattern type for a memory location.
- p Non-latching test pattern type for a memory location.

|   |                                                                                                           |
|---|-----------------------------------------------------------------------------------------------------------|
| q | Measurement duration of the test in hours, minutes, seconds respectively specified for the designated LC. |
| r | Errored threshold type specified for the designated LC.                                                   |
| s | Error threshold value specified for the designated LC.                                                    |
| t | Maximum number of lost synchronization specified for the indicated LC.                                    |
| u | Maximum number of errored bits indicated for the designated LC.                                           |

## 2. REASON FOR OUTPUT

Response to OP:LIBUF input request.

**NOTE:** For format 2 some ISDN7 messages, the names of some fields may be meaningless.

For format 3, \* In UDTs messages, PCLASS is replaced by DGPAR=n

**NOTE:** For format 3, SCCP messages other than UDT and UDTs, the names of some fields such as MTYPE may be meaningless.

**NOTE:** For format 5, SNM7 messages with a message group of CHM, ECM or MIM, the AFFPC field is not present and will not be printed.

**NOTE:** Form format 7, when the RF=0, the RC and RTAD are not valid.

## 3. VARIABLE FIELD DEFINITIONS

- a Group number.
- b Member number.
- c Type of buffer.

## 2. REASON FOR OUTPUT

Prints in response to the OP:LNSTAT input message. Format 1 prints OP:LNSTAT requested data. Format 2 reports that the OP:LNSTAT command aborted prior to outputting the data.

## 3. VARIABLE FIELD DEFINITIONS

a Group number (0-63).  
b Member number (1-15).  
c Network time. The format of this field is: h:m:s. Where: h = hour,  
m = minutes, s = seconds.  
d Minor State:  
IS — In Service.  
MOOS — Manual Out Of Service.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 00S — Out Of Service.
- e Link Type: A, B, C, D, E, G, W, S
- f Link speed:
- 56 — 56kps.
- 56D — 56kps DS0 equipped link node.
- 64C — 64kps Clear.
- 1.544M — 1.544Mbps
- g Error Correction Mode:
- BEC — Basic Error Correction
- PCR — Preventive Cyclic Retransmission
- h Facility Type:
- DS0
- DS1
- DSU
- T1FA
- i Link Interface Board (LIB) Type and Circuit Pack Number:
- LI4D-TN1315
- LI4S-TN1316
- LID0-TN1669
- LIE-TN917B
- LINE-TN916
- LIT1-TN2520 — Universal Link Node (ULN) is a Ring Interface Board (RIB) and LIB with T1 option module.
- UNKNOWN — ULN has an unknown LIB and option module.
- j Level 2 State:
- ALG\_NRDY — Alignment Not Ready due to processor outage interruption. Local and/or remote processor outage must cease before level 2 can go in service.
- ALG\_RDY — Local initial alignment complete (Ready) and we are waiting on FISU and/or MSU to go in service (level 2 state = IS and timer T1 is active).
- INTALGN\_E — This is the initial alignment state 2 of being aligned, level 2 will be sending SIN or SIE and waiting for SIN or SIE (timer T3 is active). Emergency proving time is used.

SEE PROPRIETARY NOTICE ON COVER PAGE

INTALGN\_N—This is the initial alignment state 2 of being aligned, level 2 will be sending SIN or SIE and waiting for SIN or SIE (timer T3 is active). Normal proving time is used.

INTNALGN\_E—This is the first step, or non-aligned stage, of initial alignment (timer T2 is active). Emergency proving time is used.

INTNALGN\_N—This is the first step, or non-aligned stage, of initial alignment (timer T2 is active). Normal proving time is used.

INTPROVIN\_E—This is the initial alignment state 3 with Emergency proving being done, and level 2 is sending and/or receiving SIE (timer T4e is active).

INTPROVIN\_N—This is the initial alignment state 3 with Normal proving being done, and level 2 is sending SIN (timer T4n is active).

IS — In Service; capable of handling level 3 traffic.

L\_POUT — Local processor outage SIPOS being sent on link.

LR\_POUT — Both local and remote processor outage (SIPOS being sent and received).

OOS — Out of Service (sending SIOS LSSU on link).

OOS\_LLT — Out of Service (performing local loop-back test).

OOS\_LLT\_FAIL — Out of Service (local loop-back test failed).

OOSINIT — ULN only. Out of Service (awaiting first start).

OOSSTOP — ULN only. Out of Service (commanded by stop).

PWROFF — Level 2 is in a power off state due to initialization, hardware failure, or transition to another state.

R\_POUT — Remote processor outage (SIPOS being received and FISU being sent).

UNKNOWN — ULN only. ULN has unknown level 2 state.

WAIT\_POUT — Recovering from processor outage, waiting for events.

k

Transmit Link Buffer Congestion Level:

XDIS1 — Transmit buffer level 1 discard state, level 0 priority MSUs are discarded.

XDIS2 — Transmit buffer level 2 discard state, level 0 and 1 priority MSUs are discarded.

XDIS3 — Transmit buffer level 3 discard state, level 0, 1, and 2 priority MSUs are discarded.

XFULL — Transmit buffer is full.

XNORM — Transmit buffer level is normal.

SEE PROPRIETARY NOTICE ON COVER PAGE

The previous bit positions match the following descriptions of valid status indications:

| Octet |        |                                                                    |
|-------|--------|--------------------------------------------------------------------|
| Bit   | Bit    |                                                                    |
| Pos.  | Symbol | Description                                                        |
| b7    | U      | Set when any remaining bit is set                                  |
| b6    | F      | Set when unavailable-signal (alias failed signal) condition exists |
| b5    | R      | Red alarm (that is, red LOF or CFC)                                |
| b4    | Y      | Yellow alarm signal detected on ESF-DL                             |
| b3    | A      | Blue alarm indication signal (LOF/CFC)                             |
| b2    | T      | Not used                                                           |
| b1    | L      | Test signal or payload loopback activated on transmit side         |
| b0    | O      | LOS/LFVR alarm state                                               |

For invalid status indications. U-bit not set, and the following values are recorded on the remaining bits:

| Octet |        |                                                                              |
|-------|--------|------------------------------------------------------------------------------|
| Bit   | Bit    |                                                                              |
| Pos.  | Symbol | Description                                                                  |
| b7    | U      | Bit NOT set; bit=0;                                                          |
| b3    | A      | Request denial between ULNs (new for ULN)                                    |
| b2    | T      | No response by Network Channel Office Equipment (NCOE) from a far-end entity |
| b1    | L      | Set by NCOE when equipment (IU) not available                                |
| b0    | O      | Set by NCOE when an illegal request is received                              |

CD — Bits 15-8, the second and third hex digits from the right, show near-end ULN's view/status of which particular FAR-END loopback condition or test signal is activated at the far-end ULN; as follows:

- b8 — Data (payload) loopback (toward facility) activated
- b9 — High-density test signal activated
- b10 — Low-density test signal activated
- b11 — All-zeroes test signal activated
- b12 — Quasi-Random test signal activated
- b13-14 — Spare
- b15 — Yellow (4Kb ESF-DL) test signal activated

SEE PROPRIETARY NOTICE ON COVER PAGE

EF — Bits 7-0, the rightmost two hex digits, indicate which specific NEAR-END loopback condition or test signal is activated, as follows:

b0 — Data (payload) loopback (toward facility) activated

b1 — High-density test signal activated

b2 — Low-density test signal activated

b3 — All-zeros test signal activated

b4 — Quasi-Random test signal activated

b5-6 — Spare

b7 — Yellow (4Kb ESF-DL) test signal activated

p

Level 1 State for 56-Kbps only:

NA — Not Available. The level one state is not available to report a link node equipped with LIE MC3F022A1 TN917B or LINE MC3F003A1 TN916 hardware.

The following are only valid for link nodes that have a DSU facility type and are equipped with hardware other than that listed previously for NA.

DSU\_ON — DSU is receiving valid data. Due to design constraints, DSU\_ON may also be obtained when the DSU is unplugged from its frame.

DSU\_OFF — DSU not receiving valid data as indicated by the DSU RSLD, DSR, and CTS leads.

ALL\_ONES — All ones are being received on the link.

The following are only valid for LID0 equipped link nodes that have a DS0 facility type.

NORM — Normal. There are no problems or other significant data to report.

DEAD\_CLK — An absent or defective DS0 composite clock signal has been detected.

ALL\_ONES — All ones are being received on the link.

NE\_LB — The Network Element Loop-back code is received.

The following are control codes received on the DS0 data leads, and are only valid for LID0 equipped link nodes that have a DS0 facility type.

ASC — Abnormal Station Code

BLOCK — Block

CMI — Control Mode Idle

SEE PROPRIETARY NOTICE ON COVER PAGE

CSU\_LB — CSU Loop-back  
DSU\_LB — DSU Loop-back  
FEV — Far-end Voice  
LBE — Loop-back Enable  
MA — MJU Alert  
MOS — T1 Multiplex-Out-Of Sync  
NOT\_RDY — Not Ready  
NSC — Non-Secondary Channel mapping of TIP bytes  
OCU\_LB — OCU Loop-back  
RLS — Release control  
TA — Test Alert  
TESTCODE — Test Code  
TIP — Transition In Progress  
UMC — Unassigned Mux Channel. This indicates some drop side, typically far-end local loop, is disconnected.  
ZEROS — All Zeros. This is an open local loop control code that indicates disconnection from the DS0 DP in D4 channel bank.

If none of the previous, then the unknown/unrecognized control code is output in hexadecimal value.

q

Node Processor Link and Node Control State:

IS\_BUF — In Service, but messages are buffered.  
IS\_BUF\_S — In Service, but messages are buffered, short processor outage.  
IS\_TXM — In Service and messages are transmitted.  
IS\_TXM\_S — In Service and messages are transmitted, short processor outage.  
OOS\_LCHKP — Out of Service - preparation for link check test.  
OOS\_LCHKR — Out of Service - link check test is running.  
OOS\_L2ID — Out of Service and level 2 is idle.  
OOS\_L2RT — Out of Service and level 2 is restoring.  
OOS\_L2UP — Out of Service and level 2 is up.  
OOS\_SIPO — Out of Service - processor outage at either one or both ends of link.  
RDY\_CB — Out of Service - ready for changeback.

|     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | RDY_CB_S — Out of Service - ready for changeback, short processor outage.                                                                                                                                                                                                                                                                                                                                                                                                                |
| r   | LI firmware version:<br>MC3F029A1<br>MC3F030A1<br>MC3F032A1<br><br>NA — Not applicable or not available. The LI is not firmware based (for example, LI4S, LI4D, and LID0) or, if the LI is firmware based, the firmware version is an older version that is not detectable by the node software.                                                                                                                                                                                         |
| s   | Text describing an error condition that has been encountered causing OP:LNSTAT to abort:<br><br>TIMED OUT WHILE WAITING FOR DATA FROM LINK NODE — This error condition may be caused by a defective link node, or, a lost message either from or to the 3B computer.                                                                                                                                                                                                                     |
| t-u | LI firmware version for 1.544 Mbps version:<br><br>t=TFNxxxx — Shows the xxxx (for example, TFN00A4-T1OM01) Thomson device firmware version number (four alphanumeric characters) on the LIB.<br><br>u=T1OMyy — Shows that the Link Option Module (LOM) on the LIB is a T1 type, with hardware version ID register number yy (2 digits). Future types of LOMs would have something other than T1OMyy printed here.<br><br>u=T1OM?? — Shows the ULN has an unknown option module version. |

#### 4. ACTION TO BE TAKEN

For format 1, none. This message is a response to the input message OP:LNSTAT. Use information provided for monitoring link node performance and trouble analysis.

For format 2, Message is self-explanatory. Seek technical assistance if unable to resolve.

#### 5. REFERENCES

Input Message  
OP:LNSTAT

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... OP:LOG  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] OP LOG a b CORRUPT SEGMENT AT c  
[d]
- [2] OP LOG a FILE e CANNOT OPEN TEMPORARY FILE
- [3] OP LOG a CANNOT OPEN LOGFILE
- [4] OP LOG a {STARTED|IN PROGRESS|COMPLETED} SEGMENT f  
g  
[d]
- [5] OP LOG a OUTPUT FILE EXISTS h
- [6] OP LOG a CANNOT CREATE OUTPUT FILE h
- [7] OP LOG a OUTPUT DIRECTORY DOES NOT EXIST i
- [8] OP LOG a OUTPUT DIRECTORY IS NOT WRITABLE i
- [9] OP LOG a PASSED BAD PARM TYPE TO FILE FUNCTION
- [10] OP LOG a STOPPED j

## 2. REASON FOR OUTPUT

Formats 1, 2, 3, and 5 indicate that an error occurred when executing the OP:LOG input message.

Formats 6, 7, and 8 indicate a system error preventing creation of the file.

Format 9 indicates that the process is using invalid data in the message structure.

Formats 4 and 10 indicate the process status.

## 3. VARIABLE FIELD DEFINITIONS

- a Name of the logfile.
- b Pathname of the file in which corruption was discovered.
- c Position, expressed in characters, in file where corruption was discovered.

|   |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| d | Message text from the logfile entry. If the output file parameter has been requested, this will not appear.                                                                                                                                                                                                                                                                                                     |
| e | Name of temporary file.                                                                                                                                                                                                                                                                                                                                                                                         |
| f | Number of output segment.                                                                                                                                                                                                                                                                                                                                                                                       |
| g | Time stamp.                                                                                                                                                                                                                                                                                                                                                                                                     |
| h | Name of the output file to be created in /fmt                                                                                                                                                                                                                                                                                                                                                                   |
| i | Name of the directory where the output file will be created                                                                                                                                                                                                                                                                                                                                                     |
| j | The STOPPED reason code: <ul style="list-style-type: none"><li>40 — cannot open temporary file</li><li>201 — given output file name is too long</li><li>202 — implied output file path name is too long</li><li>203 — given output file is formatted incorrectly</li><li>208 — given input file name is too long</li><li>211 — cannot create temporary file</li><li>212 — cannot write temporary file</li></ul> |

#### 4. ACTION TO BE TAKEN

If Format 1 prints, the contents of the corrupt logfile must be SAVED on paper and /or tape for later reference. The corrupt logfile entries should be cleaned up by using the DEL : LOG input message on the logfile without any selection criteria.

If Format 2 prints, check the /tmp file system to see if all the space is used up.

If Format 3 prints, check to see if the logfile exists under the pathname specified in the device record.

If Format 5 prints, retry the command with a file name that is 14 characters or less and contains no slashes (/) to denote a sub-directory.

If Format 6 prints, check to see if there are i-nodes available on the file system partition in which that directory resides. If i-nodes are available, contact technical support for further assistance.

If Format 7 or 8 prints, check to see if the identified directory exists and has write permission.

If Format 9 prints, contact technical support for further assistance.

If Format 10 prints, check SPLLOG for CSOP error messages.

#### 5. REFERENCES

##### OMDB Keys

Formats 1, 2, and 3 have an OMDB key of 277.

Format 4 has an OMDB key of 279.

Formats 5 through 10 have an OMDB key of 276.

- [8] OP MEMERRS CANNOT WRITE TEMPORARY FILE j
- [9] OP MEMERRS CANNOT CLOSE TEMPORARY FILE j

## 2. REASON FOR OUTPUT

To report a table of interpreted 3B20D/3B21D CU memory errors from MEMLOG. 3B21D CU memory errors are not interpreted because there is only one memory board in each CU.

Format 3 indicates the information message stating that there are no memory errors stored in the log files.

Format 4 indicates that memory error interpretation was requested on 3B21D CU memory errors.

**NOTE:** When a variable has no value, a dash("-") is printed in its place.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

|          |                                                                                                                                                                                                                                                                                                                                                                         |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mm/dd/yy | Date that the memory error occurred. Listed in the form of month/day/year.                                                                                                                                                                                                                                                                                              |
| hh mm    | Time of day of the memory error. Listed in the form of hour and minute.                                                                                                                                                                                                                                                                                                 |
| a        | Control Unit (CU) number of the faulty unit.                                                                                                                                                                                                                                                                                                                            |
| b        | Main store controller of the faulty unit.                                                                                                                                                                                                                                                                                                                               |
| c        | Indicates where the error occurred.<br><br>MY — My store.<br>OTH — Other store.                                                                                                                                                                                                                                                                                         |
| d        | Type of memory error that occurred.<br><br>A — An "or" over several circuit checks resulted in error detection.<br>B — An attempt was made to access an unequipped memory array or module.<br>C — The Hamming check circuitry detected a multi-bit uncorrectable error during a system access of memory.<br>D — A system or refresh access of memory detected an error. |
| e        | Slot number of the faulty data. This number is relative to the CU.                                                                                                                                                                                                                                                                                                      |
| f        | Hexadecimal code identifier for memory devices. This value is only reported on an error D and is used to locate the faulty chip on the array board. The form of this identifier is nnss where ss is the side (A, B, 1A, 1B, 2A, 2B) of the memory device.                                                                                                               |
| g        | Indicates whether the detected error was correctable or uncorrectable.                                                                                                                                                                                                                                                                                                  |
| h        | Indicates whether the error was detected during system or refresh access.                                                                                                                                                                                                                                                                                               |
| i        | The error A interrupt source formed from an "or" of several check circuits internal to the memory controller. The error A source is only output if an error A has occurred.                                                                                                                                                                                             |
| j        | The name of the temporary file.                                                                                                                                                                                                                                                                                                                                         |

### 4. ACTION TO BE TAKEN

If the abort message appears, remove any files in directory tmp of the form MEMERRS-XXXXXX and retry the message.

If the warning message that the slot numbers are invalid appears, the slot numbers in the table cannot be trusted. This message indicates that the Equipment Configuration Database (ECD) cannot be properly accessed; seek technical assistance to rectify this problem. Also, all equipment is assumed to be the same as in CU 0 and only MASC 0 and MASC 1 are allowed for any CU.

SEE PROPRIETARY NOTICE ON COVER PAGE

If question marks (?) appear at any place, the data being read is invalid. Output will resume at the next valid entry.

Format 3 is not an error condition. It requires no action.

## 2. REASON FOR OUTPUT

To report the result of executing an OP:MHD;INFO input message.

Format 5 is used to output data for an Storage Module Device (SMD) Moving Head Disk (MHD).

Format 6 is used to output data for a Small Computer System Interface (SCSI) MHD.

## 3. VARIABLE FIELD DEFINITIONS

- a MHD member number.
- b Process step or reason code:
- f01 — Failed to enable message reception.
  - f03 — Failed to open Equipment Configuration Database (ECD).
  - f06 — Failed to get Unit Control Block (UCB) by name.
  - f08 — Failed to get top UCB.
  - f0a — Top UCB is not a Disk File Controller (DFC).
  - f0c — Unknown DFC type.
  - f0e — Failed to get UCB of SCSI Bus (SBUS).

SEE PROPRIETARY NOTICE ON COVER PAGE

- f11 — Failed to assign special device file name for DFC.
  - f14 — Failed to open special device file for DFC.
  - f17 — See Disk Driver (DKDRV) report on the Read Only Printer (ROP).
  - f1a — Failed to close special device file.
  - f1c — Failed to release special device file.
  - f1f — Failed to unreserve DFC UCB.
  - f23 — Failed to get next UCB.
  - f26 — Failed to assign special device file name.
  - f29 — Failed to open special device file.
  - f2c — Failed to set Input / Output (I/O) mode of device file.
  - f2f — Device size not recognized.
  - f33 — See DKDRV report on the ROP.
  - f36 — Failed to close special device file.
  - f37 — Failed to release special device file.
  - f38 — Failed to unreserve device UCB.
  - f3e — Message to port failure.
  - f43 — Message reception failure.
  - f46 — Process timed out.
  - f49 — Failed to close special device file.
  - f4c — Failed to release special device file.
  - f4f — Failed to unreserve UCB.
  - f53 — Failed to close ECD.
  - f56 — Terminated externally with signal.
- c      System error code number. See the System Error Codes Output Appendix, APP:SYSERR.
- d      Member number of controller.
- e      Major status of unit.
- f      DFC firmware/pumpcode version:  
        A.B.C — D  
                A = Version of DFC FIRMWARE/PUMPCODE.  
                B = Issue of DFC FIRMWARE/PUMPCODE.  
                C = Point issue of DFC FIRMWARE/PUMPCODE.  
                D = Laboratory Design Issue (LDI) of DFC FIRMWARE/PUMPCODE.
- NAP — The pumpcode version is not applicable for SMD DFCs.
- NAV — The firmware or pumpcode versions are not available, or cannot be determined.
- g      Unit number.
- h      Device ID (drive ID number).

SEE PROPRIETARY NOTICE ON COVER PAGE

- i Physical port where the SMD disk is connected to the DFC:  
NAV — The DFC is not available, or the DFC is reserved, or the SMD DFC firmware/ pumpcode version is earlier than 3.2.0.  
data — Physical port number.
- j Number of tracks on the SMD disk drive:  
NAV — DFC is not available, or the unit is reserved.  
data — Decimal number of disk tracks.
- k Validity of the Volume Table Of Contents (VTOC):  
INVALID — Could not find a valid VTOC entry.  
NAV — Could not reserve unit - VTOC not read.  
UNRDBLE — Read error while trying to read VTOC.  
VALID — VTOC has a valid VTOC entry.
- l Usability:  
NO — Disk data integrity is unknown.  
YES — Disk is considered usable.
- m Unit reserved:  
NO — Unit is not reserved.  
YES — Unit is reserved for maintenance activity.
- n Unit essential:  
data — Hexadecimal value of the essential field of the unit's UCB.
- o Unit's mate:  
SMPLX — Unit has no mate.  
data — Unit name and member number of duplex mate.
- p Equipage size based on the physical drive. For SCSI disks, the physical drive size is determined by reading the capacity of the disk from the disk drive itself. For SMD disks, the physical drive size is determined by reading the equipage value in the UCB record:  
160MB — (SMD disk drive)  
300MB — (SMD disk drive)  
322MB — (SCSI disk drive)  
340MB — (SMD disk drive)  
600MB — (SCSI disk drive)  
1000MB — (SCSI disk drive)  
2000MB — (SCSI disk drive)  
NAV — The DFC is not active, or the SCSI device is inaccessible, or the unit is reserved.

SEE PROPRIETARY NOTICE ON COVER PAGE

q Equipage size based on the UCB equipage value. The drive size is determined by reading the equipage value in the UCB record for the unit:

160MB — (SMD disk drive)  
 300MB — (SMD disk drive)  
 322MB — (SCSI disk drive)  
 340MB — (SMD disk drive)  
 600MB — (SCSI disk drive)  
 1000MB — (SCSI disk drive)  
 2000MB — (SCSI disk drive)  
 NAV — The DFC is not active, or the unit is reserved.

r Equipage size based on the VTOC. The drive size is derived from the maximum capacity of the unit's VTOC:

160MB — (SMD disk drive)  
 300MB — (SMD disk drive)  
 322MB — (SCSI disk drive)  
 340MB — (SMD disk drive)  
 600MB — (SCSI disk drive)  
 1000MB — (SCSI disk drive)  
 2000MB — (SCSI disk drive)  
 NAV — The DFC is not active, or the unit is reserved, or the unit is inaccessible.

s Sizes compatible:

NAV — At least one of the equipage sizes are not available.

NO — DRIVE, UCB, and VTOC equipage sizes are not compatible.

YES — DRIVE, UCB, and VTOC equipage sizes are compatible.

Equipage sizes are not compatible if the drive size is not equal to the UCB equipage size or if the drive size is smaller than the VTOC size.

Size comparisons are based on the formatted capacity of a disk drive. The formatted capacity of the LUCENT RTR-supported disk drives are:

| Drive  | Formatted Capacity |
|--------|--------------------|
| 160MB  | 133MB              |
| 300MB  | 253MB              |
| 322MB  | 322MB              |
| 340MB  | 277MB              |
| 600MB  | 604MB              |
| 1000MB | 1000MB             |
| 2000MB | 2000MB             |

t SBUS unit number if the DFC is a SCSI device. Logical unit number of the SCSI bus that is stored in the SBUS's UCB.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                                                                                                                                                           |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| u | SCSI Host Adapter (HA) bus identification number (0 - 1).                                                                                                                                                                                                 |
| v | Device type.                                                                                                                                                                                                                                              |
| w | Product identification:<br><br>NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.<br><br>data — Alphanumeric data representing the product identification of a SCSI device.                            |
| x | Revision level:<br><br>NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.<br><br>data — Alphanumeric data representing the revision level of the firmware in a SCSI device.                            |
| y | Serial number:<br><br>NAP — Not applicable for this device.<br><br>NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.<br><br>data — Alphanumeric data representing the serial number of a SCSI device. |

#### 4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

For Formats 5 and 6, if the drive equipage sizes are not compatible, verify the correctness of the UCB equipage value. If there is still an inconsistency, contact the next level of technical assistance.

## 2. REASON FOR OUTPUT

To report the result of executing an OP:MT;INFO input message.

Format 5 is used to output data for a Small Computer System Interface (SCSI) Magnetic Tape (MT) device.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a MT member number.
- b Process step or reason code:
- f01 — Failed to enable message reception.
  - f03 — Failed to open Equipment Configuration Database (ECD).
  - f06 — Failed to get Unit Control Block (UCB) by name.
  - f08 — Failed to get top UCB.
  - f0a — Top UCB is not a Disk File Controller (DFC).
  - f0c — Unknown DFC type.
  - f0e — Failed to get UCB of Small Computer System Interface Bus (SBUS).
  - f11 — Failed to assign special device file name for DFC.
  - f14 — Failed to open special device file for DFC.
  - f17 — See Disk Driver (DKDRV) report on the Read Only Printer (ROP.)
  - f1a — Failed to close special device file.
  - f1c — Failed to release special device file.
  - f1f — Failed to unreserve DFC UCB.
  - f23 — Failed to get next UCB.
  - f26 — Failed to assign special device file name.
  - f29 — Failed to open special device file.
  - f2c — Failed to set Input / Output (I/O) mode of device file.
  - f2f — Device size not recognized.
  - f33 — See DKDRV report on the ROP.
  - f36 — Failed to close special device file.
  - f37 — Failed to release special device file.
  - f38 — Failed to unreserve device UCB.
  - f3e — Message to port failure.
  - f43 — Message reception failure.
  - f46 — Process timed out.
  - f49 — Failed to close special device file.
  - f4c — Failed to release special device file.
  - f4f — Failed to unreserve UCB.
  - f53 — Failed to close ECD.
  - f56 — Terminated externally with signal.
- c System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- d Member number of controller.
- e Major status of unit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f DFC firmware/pumpcode version:
- NAV — The firmware or pumpcode versions are not available, or cannot be determined.
- A.B.C — D
- A = Version of DFC FIRMWARE/PUMPCODE.  
B = Issue of DFC FIRMWARE/PUMPCODE.  
C = Point issue of DFC FIRMWARE/PUMPCODE.  
D = Laboratory Design Issue (LDI) of DFC FIRMWARE/PUMPCODE.
- g Small Computer System Interface Bus (SBUS) unit number. Logical unit number of the SCSI bus that is stored in the SBUS's UCB.
- h SCSI HA bus identification number (0-1).
- i Unit number.
- j Device type.
- k Device ID (drive ID number).
- l Unit reserved:
- NO — Unit is not reserved.
- YES — Unit is reserved for maintenance activity.
- m Product identification:
- NAP — Not applicable for this device.
- n Revision level:
- NAV — The DFC or the SBUS is not active, or the unit is reserved, or the SCSI device is inaccessible.
- data — Alphanumeric data representing the revision level of the firmware in an SCSI device.
- o Serial number:
- NAP — Not applicable for this device.

#### 4. ACTION TO BE TAKEN

A termination report specifying completion indicates all directives of the input request were done and no failures were encountered.

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available, or became unavailable to perform the requested task. Clear the problem causing the resource limitation and try the request again.

## 2. REASON FOR OUTPUT

Information depends upon the equipment and status of the ring. In addition to the Common Network Interface (CNI) status of the node, the state of each link is given and other pertinent information depending upon the node type and what is defined in the database. If the MAJOR state is unequipped, no other data is given for that node.

If an office does not contain any nodes of a particular type, then no information is given about that node type. If only a specific node type was requested (see OP:NODES input message, Format 2), then only the data for the requested node type is output.

Format 9 prints the information that compares the node software verses the 3B version of the software.

## 3. VARIABLE FIELD DEFINITIONS

|     |                                                               |
|-----|---------------------------------------------------------------|
| aa  | Group number of the node (00-63).                             |
| b   | Member number of the node (1-15).                             |
| c   | Link Interface (LI) board number (0-1).                       |
| d   | Port number (0-3).                                            |
| eee | CNI major state (AVL   UNA   UNE   UNK).                      |
| f   | CNI minor state (GROW   IS   MOOS   OOS   STBY   TEST   UNK). |

```

[2] Output format when FILE is specified on the command line.

A. Rop data output format.

The rop format for the OP:NPMEM command when FILE is the argument to the NPMEM keyword follows:

OP NPMEM FILE {RPCNx 0 | LNx y} a

n BYTES OUTPUT IN FILE - p f

B. File data output format

The file memory or port data dump is blocked by request. All data pertaining to that request will be contained within a single block. The block of data will be preceded by a date time stamp and the type, group and position of the node. All data dump requests for a node is appended to one file (provided that the directory for file placement doesn't change). Therefore, a file can contain multiple dump requests. The maximum number of bytes per line of data dump is 16.

The format of the file produced for the OP:NPMEM command when FILE is the argument to the NPMEM keyword follows:

```

t
[AP] {RPCNx 0 | LNx y}
b

```

```

c d

```

[3] Output format when FILEROP is specified on the command line.

A. Rop data output format.

The memory data dump is blocked into 432 or smaller byte blocks for memory or port dumps. Dumps greater than 432 bytes will result in multiple blocks of output data.

SEE PROPRIETARY NOTICE ON COVER PAGE

The memory/port data dump format for a full 432 bytes block is as follows:

b

[illegible]

n BYTES OUTPUT IN FILE - p f

The file format for the **OP:NPMEM** command when **FILEROP** is the argument to the **NPMEM** keyword is the same as when the argument is **FILE**.

**Issue 9.4**  
**September 2001**

[4] Output format when RAW3B or RAW80 is specified on the command line.

A. Rop data output format.

The rop format for the OP:NPMEM command when RAW3B or RAW80 is the argument to the NPMEM keyword follows:

OP NPMEM r {RPCNx 0 | LNx y} a

n BYTES OUTPUT IN FILE - p g

B. File data output format

The file memory or port data dump is grouped by request. All data pertaining to that request will be contained within a single grouping.

The data part of the dump will be preceded by a header which contains a date time stamp; the type, group and position of the node; the start address of the data dumped and the total number of bytes dumped.

The date time stamp and node type, group and position will be in ASCII. The start address, total bytes dumped and dumped data will be in binary.

The data portion of the dump is byte ordered according to the target machine's byte ordering.

All data dump requests for a node is appended to one file (provided that the directory for file placement doesn't change). Therefore, a file can contain multiple dump requests.

The format of the file produced for the OP:NPMEM command when RAW3B or RAW80 is the argument to the NPMEM keyword follows:

t  
[AP] {RPCNx 0 | LNx y}  
h q k

[5] No data output format.

This format may be output by itself or accompany Formats [1], [2], [3], or [4].

OP NPMEM STOPPED  
e

## 2. REASON FOR OUTPUT

The OP-NPMEM output message is in response to the OP:NPMEM input message and provides the data dump of memory or port locations from a node processor (NP) or an attached processor (AP).

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a Termination code.  
{STARTED | IN PROG | COMPL}
- b MADDR — Node processor memory.  
BPORT — Byte port.  
APADDR — Attached processor memory.
- x The Ring Node (RN) group number (00-63).
- y The node position in the RN group (0-15).
- c Start address in hex of the first byte of NP memory or port represented on this line.
- d Contents of the indicated byte in node memory / port in hex.
- e One of several explanations that can appear in describing the reason for stopping. Most reasons are self explanatory. Examples of error outputs and their meanings follow:
- ?E — The basic format of the message appears correct, however, further checks have revealed an inconsistency and the fields in error cannot be identified. This acknowledgment is used only when system design limitations make further error isolation impractical.
- Additional output that can accompany the ?E output -  
CFTSHL UNABLE TO MATCH COMMAND X.
- ?I — The message contains an error in the identification field of the message. This could mean that an improper character(s) or out-of-range numeric was entered or that a field, sub-field or keyword delimiter was omitted. It may also result from an invalid association of the identification field contents with the action field.
- Additional output that can accompany the ?I output
- INVALID KEYWORD: X  
VALID KEYWORDS: AA BB CC
  - MISSING DATA FOR KEYWORD: X
  - RANGE ERROR IN X; RANGE(0-X'FFFF)
  - RANGE ERROR IN X; RANGE(1-1024)
  - RANGE ERROR IN X; RANGE(1-60)
  - RANGE ERROR IN X; RANGE(0-15)
  - RANGE ERROR IN X; RANGE NEGATIVE
  - RANGE ERROR IN X; MADDR PLUS NBYTES  
EXCEEDS NP MEMORY
  - INPUT ERROR; BAD NODE NAME< X >
  - INPUT ERROR; < X > UNEXPECTED HERE
  - INPUT ERROR; GROUP NAME < X > MISSING
  - INPUT ERROR; GROUP NAME < X > TOO LONG

SEE PROPRIETARY NOTICE ON COVER PAGE

PF — The request was received and will be processed. A printout will follow giving either a termination report or termination report and results of the work initiated by the input message.

- [7] OP OFL RETRY LATER i
- [8] OP OFL WRITE TO j  
FAILED ON KEY #k

## 2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:OFL input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name. Computer unit names are listed in the Member Numbers Output Appendix C, APP:MEM-NUM-C.
- b Unit number. See the Member Numbers Output Appendix C, APP:MEM-NUM-C.
- c Subunit name, if subunit name is CU, CU subunit names are listed in Member Numbers Output Appendix D, APP:MEM-NUM-D.
- d Subunit number. See the Member Numbers Output Appendix C, APP:MEM-NUM-C.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e The current maintenance state of the unit is indicated by the identifiers:
- ACT — Active units.
  - GROW — Units being grown.
  - INIT — Initializing units.
  - OFL — Offline units.
  - OOS — Out-of-service units.
  - STBY — Standby units.
  - UNAV — Unavailable units.
  - UNEQIP — Unequipped units.
- f Indicates the current inhibit status of the associated error source:
- ALW — Allowed.
  - INH — Inhibited.
- g Results of the last diagnostic on the unit:
- ABT — Aborted diagnostics.
  - ATP — All tests passed.
  - CATP — Conditional all tests passed.
  - NTR — No tests were run.
  - STF — Some test failed.
- h Error number:
- 9 — Cannot attach to plant measurement library.
  - 11 — Cannot open Equipment Configuration Database (ECD) sequence.
  - 12 — Cannot sequence Unit Control Blocks (UCBs).
- i Retry the command later for the reasons:
- CANNOT CREATE FILE IN /tmp
  - CANNOT GET DATABASE RECORD ID
  - CANNOT SEQUENCE DATABASE
- j Temporary output file name.
- k Key associated with write failure.

#### 4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

#### 5. REFERENCES

- [7] OP OMDB ABORTED  
UNABLE TO SEND REQUEST TO CSOP
- [8] OP OMDB NOT STARTED  
CONFLICT WITH CURRENT SYSTEM STATUS g

## 2. REASON FOR OUTPUT

To report the result of executing an OP : OMDB input message.

## 3. VARIABLE FIELD DEFINITIONS

- a          DISK for Output Message Database (OMDB) disk file or ACT for active OMDB.
- b          List of message keys for which the OP : OMDB failed.
- c          Message key that was requested. There will be one line in the report for each key requested.
- d          Numeric value of the message class associated with the message for the message key.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e Alarm level associated with the message for the message key:
- ACT
  - CRIT
  - MAJ
  - MAN
  - MIN
  - INFO
  - VAR
- f Up to 40 characters of the text associated with the message for the message key. The text shown in this report may include "%" characters. These characters indicate that variable data will be passed by the requesting process when this message is to be formatted and spooled.
- g Further explanation of error:
- INVALID KEY
  - INVALID OMDB COPY
  - SYNTAX ERROR
  - TOO MANY KEYS

#### 4. ACTION TO BE TAKEN

Format 1 indicates success.

For format 2, verify that the key(s) was entered correctly.

For format 3, determine if the disk is available. If the disk is available, verify the status of the OMDB disk file by using the `OP:ST-LISTDIR` command for `/cft/spl/omdb`.

For format 4, verify that the OMDB disk file (`/cft/spl/omdb`) is there. If the file is there, run the `ACTV:OMDB` command. If that does not solve the problem, attempt a craft initialization. If the file is not on the disk, restore the file and then run `ACTV:OMDB`.

Format 5 indicates a possible file system problem, such as lack of available disk space.

Format 6 indicates successful execution of the command.

For format 7, verify that the Coordinator Of Spooler Output Processes (CSOP) is running.

For format 8, verify that the input message was entered correctly.

## 2. REASON FOR OUTPUT

Output formats [1] and [2] are in response to input command OP:OUTCLS, and output formats [3] and [4] are in response to input command OP:OUTCLS (with ALL option).

If all output classes were requested, then the class/device information will be displayed for each output class in the Equipment Configuration Database (ECD). The number of devices assigned to an output class can vary from one to twenty. Only the assigned device names will be displayed from left to right and top to bottom.

SEE PROPRIETARY NOTICE ON COVER PAGE

Each IN PROG output will contain a maximum of ten classes meaning there will be multiple IN PROG outputs if there are more than ten classes.

### **3. VARIABLE FIELD DEFINITIONS**

ID ..... OP:PMCR  
WORK CENTER.. MOC  
GENERIC ..... 4AP13 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] OP PMCR ERROR abbc[,ERRNO = {d|e|f|g|h|i}]
- [2] OP PMCR INFO abbc

## 2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes which comprise the Plant Measurements Common Report (PMCR) capability.

The error code is a four-digit error code. This code consists of a one-digit number which indicates the PMCR process in which the error was detected, a two-digit number which indicates the error type, and a one-digit number which shows the location of the error within the specific process. The last digit is necessary for field support and is only used by developers. Therefore, all possible values and their meanings are not documented.

## 3. VARIABLE FIELD DEFINITIONS

- a Process values (first digit):
- 1 — PMCR craft interface
  - 2 — PMCR manager
  - 3 — PMCR collector
  - 4 — PMCR report generator
- bb Error-type values (second and third digits):
- 00 — User is not allowed to request scheduled report. This message comes from PMCR craft interface as ERROR 1001.
  - 01 — Could not connect to system port.
  - 02 — Could not send or receive message.
  - 03 — Failed plib call.
  - 04 — Failed pl\_init call.
  - 05 — Failed pl\_attrec call.
  - 06 — Failed pl\_update call.
  - 07 — Failed pl\_read call.
  - 08 — Failed lla\_iatt call.
  - 09 — Failed lla\_irel call.
  - 10 — Failed lla\_rdget call.
  - 11 — Failed lla\_opensq call.
  - 12 — Failed lla\_nextseq call.
  - 13 — Could not execute PMCR collector or PMCR report generator.
  - 14 — Could not get ECD segments.
  - 15 — Could not get reporting office name from ECD.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 16 — Computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day), or in a negative value.
  - 17 — Bad arguments received by PMCR report generator.
  - 18 — Spool error during output of report.
  - 19 — No data has been collected to output a retained/demand report. Requesting a daily retained report should not be attempted until after a scheduled daily report has been generated. Requesting an hourly retained report should not be attempted until after a scheduled hourly report has been generated. Demand reports should not be attempted until at least one hour after a valid scheduled daily report has been generated.
  - 22 — PMDB initialization time reset to current time.
  - 23 — Start time reset to 0.
  - 24 — Start time reset to current time.
  - 25 — Change reason for start time and reset start time to 0.
  - 26 — Start time reset to top unit start time.
  - 27 — Change reason for start time to top unit reason and reset start time to top unit start time.
  - 28 — Hour limit exceeded - time reset to one hour.
  - 29 — Negative time count time reset to 0.
  - 30 — Day limit exceeded - time reset to one day.
  - 31 — The current value (for example, alarm count) is less than count recorded from previous hour, or previous count was invalid.
  - 32 — Open of /etc/log/pmcrlog file failed.
  - 33 — Could not execute pmdbcoppy.
  - 34 — Unrecognized UCB status.
  - 35 — Failed malloc call.
  - 36 — Failed lla\_gtrid call.
  - 37 — Plant Measurements audit record deleted.
  - 38 — Bad arguments supplied to pmcrman via the "PMCRMAN" ULARP form. There should be no more than two arguments to pmcrman. The arguments should be a number (0-23) indicating the time the daily reports should be generated and/or "NEF". "NEF" is used by 5E International which uses the eaiopt fields differently than expected.
- c      Process location value (fourth digit). Possible values and meanings are not documented because this digit is necessary for field support and is only used by developers.
- d      Error code returned by the failing function call. If the error code is x01x, x02x, x03x, x13x, x14x, x15x, x16x, x181, or x182, see the System Error Codes Output Appendix, APP:SYSERR.
- e      Error code returned by the failing function call. If the error code is x04x, x05x, x06x, or x07x, this variable is the plant measurements error code number.

SEE PROPRIETARY NOTICE ON COVER PAGE

- |   |                                                                                                                                                                                    |
|---|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f | Error code returned by the failing function call. If the error code is x17x or x183, this variable is the value of the bad arguments passed to the function or process.            |
| g | Error code returned by the failing function call. If the error code is x34x, this variable is the invalid UCB status.                                                              |
| h | Error code returned by the failing function call. If the error code is x37x, this variable is the deleted audit record.                                                            |
| i | Error code returned by the failing function call. If the error code is x08x, x09x, x10x, x11x, x12x, x19x, x35x, x36x, x37x, or x38x this variable does not specify an error code. |

#### 4. ACTION TO BE TAKEN

For error messages x22x through x31x, see /etc/log/pmcrllog for record name information. These error messages indicate that the count or time for the unit may not be valid. Since these errors are corrected by pmcrman, they are for information only and require no further action. Some of these errors may be seen at boot time or after stopping Off Line Boot (OFLBOOT).

The log file (/etc/log/pmcrllog) is reset each time a scheduled report runs.

For all other errors, the table shows the action to be taken based on the error code. In all instances, seek technical assistance if the error persists.

If x01x is the error code, Request output of scheduled reports to be turned on by using OP:PMCR;TYPE STAT input command. Then scheduled hourly reports will be printed at the end of the hour, and daily at the end of the day.

If x01x is the error code, Check port 27, using the OP:STATUS;PORTS input message, to see if another process has control of the port.

If x02x is the error code, Check that the correct OP:PMCR input message was entered. Request output of scheduled reports to be turned on by using OP:PMCR.

If x03x - x07x is the error code, Check the usability of the plant measurements database.

If x08x - x12x is the error code, Check the usability of the ECD.

If x13x is the error code, Check the usability of the PMCR processes.

If x14x - x15x is the error code, Check the usability of the ECD.

If x16x is the error code, Check system clock versus last clean report.

If x17x is the error code, Check that the correct OP:PMCR input message was entered.

If x18x - x19x is the error code, No action can be taken.

If x32x is the error code, Check that the /etc/log/ directory has read/write/search permission, that the etc/log/pmcrllog file (if it exists) has write permission, and that free blocks and i-nodes are available on the file system.

If x33x is the error code, Check that the /prc/pmdbcopy file exists and is executable.

SEE PROPRIETARY NOTICE ON COVER PAGE

If x34x - x35x is the error code, Seek technical assistance if the error persists.

If x36x is the error code, Check the usability of the ECD.

If x37x is the error code, No action to be taken.

If x38x is the error code, Check the "PMCRMAN" ULARP form to ensure the arguments are correct. Seek technical assistance if necessary.

## 1. FORMAT

OP RCAS TASKS COMPLETED

TASK CONTROL BLOCK (TCB) STATUS

| TCB | STATUS | PROCID | NAME | STACK | SWITCHES |
|-----|--------|--------|------|-------|----------|
| a   | X'b    | X'c    | X'd  | X'e   | f        |

## 2. REASON FOR OUTPUT

To report the status of RCAS tasks.

## 3. VARIABLE FIELD DEFINITIONS

- a Task control block (tcb) number. Possible values: 0 through 15.
- b Task status. Representation of bits:
- 0x0 — tcb slot is available.
  - 0x1 — tcb slot is in use.
  - 0x2 — tcb is ready to run.
  - 0x4 — tcb is currently running.
  - 0x8 — tcb is to be torn down.
  - 0x10 — tcb is timing.
  - 0x20 — tcb is starting.
  - 0x40 — tcb is expecting an RTR msg stimulus.
  - 0x80 — tcb is expecting an INT msg stimulus.
  - 0x100 — tcb is expecting an ACK msg stimulus.
  - 0x200 — tcb is expecting WAKEUP event
  - 0x400 — tcb is expecting SHUTDOWN event
  - 0x800 — tcb is expecting user event 1.
  - 0x1000 — tcb is expecting user event 2.
  - 0x2000 — tcb is expecting user event 3.
  - 0x4000 — tcb is waiting for an audit to be dispatched.
- c Procedure ID. Byte representation:
- First byte (leftmost) — Zero value.
  - Second byte — Procedure number.
  - Third byte — tcb number.
  - Fourth byte (rightmost) — Incarnation bit.
- Procedure ID equal to zero implies null procedure.

INVALID DATA FIELD
- [4] OP REXINH NOT STARTED  
RETRY LATER
- [5] OP REXINH CANNOT WRITE TO d  
WITH MESSAGE FROM KEY # e

## 2. REASON FOR OUTPUT

Format 1 is printed in response to an OP:REXINH input message. This message reports either the temporary routine exercise inhibits or the permanent routine exercise inhibits if the PERM option was specified on the input message. The INH:REX input message temporarily inhibits routine exercises from hardware communities. The INH:DMQ input message can temporarily inhibit honoring routine exercise process maintenance requests. This message reports if routine exercises are inhibited in the Diagnostic Maintenance Queue (DMQ) or if the DMQ cannot be accessed as part of temporary routine exercise inhibits. DMQ inhibits may be verified by using the OP:DMQ input message. Permanent routine exercise inhibits are established for hardware communities by a field in the Equipment Configuration Database (ECD).

Format 2 could not open temporary file used for sending report data to Coordinator of Spooler Output Processes (CSOP) - no report is generated.

## 3. VARIABLE FIELD DEFINITIONS

- |             |                                    |

## 2. REASON FOR OUTPUT

The OP:RING output message is in response to an OP:RING input message and provides status and generic information of specific ring nodes, groups of ring nodes, or the entire ring in general.

Format 1 provides a general summary output.

Format 2 provides a detailed summary output. The example shows the output of all the ring nodes as if the option ALL was entered. If the option ALL was not entered then only the lines containing the equipped ring nodes will be output (This is the default condition).

Formats 1 and 2 also provide the status of Ring Error Analysis threshold.

SEE PROPRIETARY NOTICE ON COVER PAGE

Ring Error Analysis and Recovery (EAR) operates in one of two modes. In the "stable" mode, EAR assumes that all ring failure events are transient in nature. Consequently, on a ring failure, the first recovery action attempted is to restore the ring to the configuration that existed before the ring failure occurred (via EAR recovery level 0). If this fails, EAR will escalate to a recovery action that usually isolates the faulty portion of the ring (via EAR recovery level 1 or 3).

EAR will keep track of the number of ring failures that occur. If the failure rate in a given time interval becomes excessive, EAR will switch its mode of operation to the "quasi-unstable" or seemingly-unstable mode. In this mode, EAR assumes that all ring failure events are not transient in nature. The first recovery action attempted then will usually isolate the faulty portion of the ring (via EAR recovery level 1 or 3). Once in the quasi-unstable mode of operation, EAR will automatically switch back to the stable mode when the ring has remained error free for a specified time interval. Formats 1 and 2 indicate "ERROR THRESHOLD EXCEEDED" when EAR is operating in the quasi-unstable mode.

Formats 3 and 4 are a single ring node output.

Format 5 is a ring node group output. (This is the same output as Format 3 and 4 but for all the ring nodes in a requested ring node group.)

Format 6 provides generic information for an Link Node (LN) ring node. An attempt will be made to print both the generic spec file according to the Interprocess Message Switch User Node (IUN) and according to the Equipment Configuration Database (ECD). These may or may not be the same, depending upon how the IUN was restored.

Each IUN has a Node Processor (NP), thus the NP generic spec file contents will be printed if possible. A given IUN may or may not have an Attached Processor (AP). If the IUN has an AP the contents to the AP generic spec file will be printed if possible.

If it is impossible to determine the generic spec file name according to the IUN, e.g., the IUN is out of service or the IUN did not respond to generic spec. file query request, the generic spec. file name will be printed as blank (null) string and the phrase NOT AVAILABLE will also be printed. If the generic spec. file's contents cannot be read, the generic spec. file name will be printed and the phrase NOT AVAILABLE will also be printed.

Format 7 provides generic information for an Ring Peripheral Controller (RPC) node.

Format 8 provides the reason the command was STOPPED.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a                      Status:
- ACTIVE
- CONFIGURING
- DOWN
- ISOLATED
- RESTORING
- b                      Ring Node group number (00-63).
- c                      Ring Node member number (1-15).
- d                      Ring node's Major State. Upper case letters indicate active portion of the ring; lower case letters indicate the isolated portion of the ring. Each group of variables represents the nodes of the respective group. The initial block represents the RPC (00) and the succeeding 15 represent the 15 LNs (01-15):

| ACT | Status           | ISO/RGDWN |
|-----|------------------|-----------|
| A   | = Active         | = -       |
| S   | = Standby        | = s       |
| U   | = Unavailable    | = u       |
| F   | = Offline        | = f       |
| O   | = Out of Service | = i       |
| .   | = Unequipped     | = .       |
| B   | = Initializing   | = b       |
| G   | = Grow           | = g       |

- e                      Numeric character representation of the minor node states when requesting OP:RING:DETD.
- blank — Node maintenance mode state AUTO and Ring interface hardware state USBL and Node processor hardware state USBL, or Node major state is UNEQ.
- 1 — Node under manual control.
- 2 — Node processor hardware maintenance state is FLTY or UNTSTD, or Ring Interface hardware maintenance state is QUSBL.
- 4 — Ring interface hardware maintenance state is FLTY or UNTSTD.
- 3, 5, 6, 7 — Combination of the definitions.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f Major state of the ring node:
- ACT — Node is active.
  - GROW — Node is being physically added to or removed from the ring.
  - INIT — Node is initializing.
  - OFL — Node is Out Of Service (OOS) and neither restoral nor removal is permitted.
  - OOS — Node is out-of-service and unavailable for normal use.
  - STBY — Node is an RPC which is running but the ring configuration is not completed or the ring is down.
  - UNAV — Unavailable.
  - UNEQ — Node is unequipped, but an ECD record may exist for it.
  - UNKNOWN MJ — An unknown major state has been encountered.
- g Maintenance mode state of the ring node:
- AUTO — If the major state is ACT, the maintenance mode is defaulted to AUTO.
  - AUTO — If the major state is OOS, the node was removed from service automatically. Automatic recovery is in progress or has not yet started. The node major state will change to ACT if the recovery is successful or the node maintenance mode will change to FLTY or XTHD if the recovery is unsuccessful.
  - FLTY — The node was removed from service automatically. Automatic recovery has been attempted and failed.
  - MAN — Node is under manual control.
  - XTHD — The node was removed from service automatically. Automatic recovery cannot be attempted since the node recovery history has exceeded the 3 permissible outages in the preceding 60 minutes.
  - UNKNOWN MN — An unknown maintenance mode state has been encountered.
- h Ring interface hardware maintenance state of the ring node:
- FLTY — Ring interface hardware is faulty.
  - QUSBL — Ring interface hardware is usable if the node is quarantined.
  - UNKNOWN — An unknown ring interface hardware state has been encountered.

## 2. REASON FOR OUTPUT

Response to an OP:RUTIL input command.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 1 indicates a successful completion of the OP : RUTIL input command.

Format 2 indicates that this particular breakpoint is not set.

Format 3 indicates that the breakpoint specified is invalid.

Formats 4 and 5 indicate that creating the special file for the kernel has failed.

Formats 6 and 7 indicate that attempting to open the file for kernel processing has failed.

Formats 8 and 9 indicate that the kernel has returned a failing return code.

Formats 10 and 11 indicate that the kernel has not responded to the craft process.

### **3. VARIABLE FIELD DEFINITIONS**

|    |                                                                                      |
|----|--------------------------------------------------------------------------------------|
| aa | The group number of the concerned node.                                              |
| b  | The member number of the concerned node.                                             |
| c  | The specified breakpoint number.                                                     |
| d  | The address of the given breakpoint.                                                 |
| e  | 1 software implementation of breakpoint.<br>2 hardware implementation of breakpoint. |
| f  | 1 breakpoint is disabled.<br>2 breakpoint is enabled.                                |
| g  | Number of hits on this breakpoint.                                                   |
| h  | Maximum number of hits specified for this breakpoint.                                |
| i  | Number of breakpoint response messages lost for this breakpoint.                     |
| j  | The value of the global variable errno.                                              |

### **4. ACTION TO BE TAKEN**

For Format 3 check the specified breakpoint number.

Otherwise seek technical assistance for Formats 4 through 11.

TYPE ..... Output

## 1. FORMAT

- [1] OP SCSD UNIT a  
      INHIBIT: cccccccc cccccccc cccccccc cccccccc cccccccc cccccccc  
      SCAN PT: dddddddd dddddddd dddddddd dddddddd dddddddd dddddddd  
      OP SCSD UNIT a b
- [2] OP SCSD GRPN e  
      DUPID f  
      INHIBIT: [ccc]  
      SCAN PT: [ddd]  
      OP SCSD GRPN e b
- [3] OP SCSD NOT STARTED  
      CONFLICT WITH CURRENT SYSTEM STATUS

## 2. REASON FOR OUTPUT

To indicate the state and the inhibit status of the scan points on a Scanner And Signal Distributor (SCSD) unit.

Format 1 is used to display the entire SCSD scan map for a unit.

Format 2 is used to display the scan state for a particular logical group.

Format 3 indicates the SCSD administration process is not active. No communication with SCSD points is possible.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number of SCSD unit.
- b Termination status.
- COMPLETED — Action completed.
- FAILED — Action could not be completed by SCSD administrator:
- SCSD unit number is invalid.
  - Point number is invalid for the logical group.
  - Logical group name is invalid and either the SCSD unit is Out Of Service (OOS) or is in an inactive state to the SCSD administrator.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Inhibit status. (Scan points are numbered 0 - 47 starting from the left)  
One of the following.
  - 0 — Scan point is not inhibited.
  - 1 — Scan point is inhibited.
- d Scan point status. (Scan points are numbered 0 - 47 starting from the left)  
One of the following.
  - 0 — Scan point is clear (open).
  - 1 — Scan point is set (closed).
- e Logical group name.
- f Duplex group ID (0-1).

#### 4. ACTION TO BE TAKEN

Issue the OP:00S input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter Recent Change And Verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the results are negative, seek technical assistance.

## 1. FORMAT

- [1] OP SDC COMPLETE  
[a]  
LNbb cc - d  
[LIe-f] [g]
- [2] OP SDC COMPLETE  
NO SDC CONDITION EXISTS

## 2. REASON FOR OUTPUT

This output message is the result of a previous OP:SDC input message. It lists the 3B-based devices that are causing loss of service to the office. Format 1 is printed when there exists at least one device causing a Service Degrading Condition (SDC). Format 2 is printed when no SDC exists.

For Format 1, only the list of failed conditions is output. This message gives all possible conditions.

## 3. VARIABLE FIELD DEFINITIONS

- a This field is optional in the output message based on the status of the system. All events that are true are printed; i.e., more than one event of the following list may be printed. If none of the events are true, then no entry will be made. Values are:
- API INPUT STREAM— The stream is down between the 3B and the API for traffic destined from the DLN to the 1B.
- API OUTPUT STREAM— The stream is down between the 3B and the API for traffic destined from the 1B to the DLN.
- DLN INPUT STREAM— The stream is down between the DLN and the 3B for traffic destined from the DLN to the 1B.
- DLN OUTPUT STREAM— The stream is down between the DLN and the 3B for traffic destined from the 1B to the DLN.
- RING INIT— A ring initialization is taking place.
- RING QUIET— The ring is in quiet mode. The ring is down and automatic recovery has failed.
- bb Group number of the node (00-63).
- cc Member number of the node (01-15).

SEE PROPRIETARY NOTICE ON COVER PAGE

- d                      Node type:
- ATP — AT&T Trigger Platform Node. The criteria for ATP nodes to be on the SDC list is that both nodes are down.
  - CCS7 — Domestic CCS7. The criteria for CCS7 nodes to be on the SDC list is a domestic CCS7 linkset has 50% or fewer active links. Each node that is down that is part of the affected linkset is put on the SDC.
  - CIT7 — International CCITT7. The criteria for CCITT7 nodes to be on the SDC list is that an international CCITT7 linkset is 100% failed. Each node in the linkset is put on the SDC.
  - DCHN — D-Channel Node. The criteria for DCHN nodes with simplex links is if there exists a link down, then the node is put on the SDC. Additional output will distinguish affected links. For DCHN nodes with D-Channel backup links, if both links of a D-Channel backup pair are down, then both nodes that contain those links are put on the list. For AT&T offices, DCHN nodes are put on the list only if the link problem is internal to the office.
  - DLN — Direct Link Node. The criteria for DLN nodes to be on the SDC list is based on the number of equipped DLNs in the office. If the office has two DLNs, then both DLNs must be down. If the office has greater than two, then three DLNs must be down. In the four DLN office, having one active twoway DLN is considered an SDC because the office was engineered to need two active DLNs for load capacity.
  - HSAL — High Speed A-link Node. The criteria for HSAL nodes to be on the SDC list is a HSAL linkset has 50% or fewer active links.
  - SADC — Special Access Data Channel. See criteria for DCHN node.
- LI                      This is an optional field for DCHN and SADC nodes only. These nodes have up to 8 links per node and any single link can cause the node to be on the SDC list. Therefore, a list of the links on the node that are causing the SDC condition are given.
- e                      Indicates which LI board (0 - 1).
- f                      Indicates which link on the LI board (0 - 3).
- g                      This is an optional field for DCHN and SADC nodes only. It gives an indication of where the problem exists for the DCHN or SADC link. Values are:
- EXTERNAL LINK FAILURE
  - INTERNAL LINK FAILURE

SEE PROPRIETARY NOTICE ON COVER PAGE

**NODE FAILURE**

**T1FA FAILURE**

#### **4. ACTION TO BE TAKEN**

For every case except RING QUIET, the 3B will be attempting automatic recovery on the failed devices. To monitor automatic recovery for stream failures, see the 1107 display page. To monitor automatic recovery on node or link failures, see the 1107 display page for DLN nodes and 1108 display page for other nodes. For the ATP nodes see page 1109.

If automatic recovery mechanisms fail to recover the device, seek technical assistance.

For the RING QUIET case, seek technical assistance.

## 2. REASON FOR OUTPUT

Prints in response to the OP:SLK input message.

The report from the OP:SLK input command may be broken into one or more output blocks. Each block of the output report is surrounded by time and date information. When a request is made for a report of more than one node, information about all nodes in the range specified will be given. This information will contain various amounts of detail depending on the state of the node/link(s) and the options used in the OP SLK input request. Some data fields included in the more detailed forms of this report, such as those obtained with the RAW option, are intended for use only by technical assistance, and those data fields are not explained in detail in this output message.

Format 1 is the default format for Common Channel Signaling System 6 (CCS6), Common Channel Signaling System 7 (CCS7), and Consultative Committee On International Telephone & Telegraph (CCITT) Common Channel Signaling System Number 7 (CCITT7) nodes. This form is obtained when none of the optional fields for these node types are specified on the input command.

Format 2 for CCS6 nodes of RAW.

Format 3 for CCS6 nodes of ABNORMAL or CODES.

Format 4 for CCS6 nodes of ROUTING.

Format 5 for CCS6 nodes of FIX.

Format 6 for CCS6 nodes of FIX and RAW.

Format 7 for CCS6 nodes of ABNORMAL and FIX.

Format 8 for CCS6 nodes of FIX and ROUTING.

Format 9 for CCS6 nodes of FIX, RAW and ROUTING

Format 10 for CCS6 nodes of ABNORMAL, FIX and ROUTING

Format 11 for CCS7 and CCITT7 nodes of RAW.

Format 12 for CCS7 and CCITT7 nodes of ABNORMAL.

Format 13 for CCS7 and CCITT7 nodes of CODES.

Format 14 for CCS7 and CCITT7 nodes of ROUTING.

Format 15 for CCS7 and CCITT7 nodes of FIX.

Format 16 for CCS7 and CCITT7 nodes of FIX and RAW.

Format 17 for CCS7 and CCITT7 nodes of ABNORMAL and FIX.

Format 18 for CCS7 and CCITT7 nodes of FIX and ROUTING.

Format 19 for CCS7 and CCITT7 nodes of FIX, RAW and ROUTING.

Format 20 for CCS7 and CCITT7 nodes of ABNORMAL, FIX and ROUTING.

Format 21 is the format for a Direct Link Node (DLN) node.

Special Access Data Channel (SADC) or D-Channel (DCHN) node. This form is obtained when none of the optional fields for this node type is specified on the input command.

Format 23 for SADC or DCHN nodes of RAW.

Format 24 for SADC or DCHN nodes of ABNORMAL or CODES.

Format 25 for SADC or DCHN nodes of ROUTING.

Format 26 for SADC or DCHN nodes of FIX.

Format 27 for SADC or DCHN nodes of FIX and RAW.

Format 28 for SADC or DCHN nodes of ABNORMAL and FIX.

Format 29 for SADC or DCHN nodes of FIX and ROUTING.

Format 30 for SADC or DCHN nodes of FIX, RAW and ROUTING.

Format 31 for SADC or DCHN nodes of ABNORMAL, FIX and ROUTING.

SEE PROPRIETARY NOTICE ON COVER PAGE

Each report is surrounded by date and time information in the following format:

kkkkkk aaaaaa bbbbbb cccccc dddddd:eeeeee:ffffff:gggggg hhhhhh

For certain reports, some nodes are skipped. The range of those skipped are shown in the report with the following format:

SLK b c THRU b c iiiiii

For DCHN or SADC links, which are skipped, the range of those skipped are shown in the report with the following format:

SLK b c mmmm nnnn oooo THRU nnnn oooo iiiiii

### 3. VARIABLE FIELD DEFINITIONS

- |    |                                                                                                                                                                                                                                                                  |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 2. REASON FOR OUTPUT

**NOTE:** For format 1 if no 30 minute exceptions are encountered, the last 2 lines will be output.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOTE:** For format 6 if no RPC overflows are encountered during the 5 minute report interval, the last 2 lines will be output.

These output messages are the result of the OP : SMR input message.

Message Formats [2a] and [3a] are output when a report generator process receives a termination signal from CMMSDP, its parent process. CMMSDP will send this termination before it aborts, if the report generator is reading a file CMMSDP needs to update, or if the number of current report generators running exceeds 20.

The general form of this message is:

OP SMR a [STARTED | COMPL | IN PROG | ABT]

If the inhibit report flag is active, no report is output. The message REPORTS ARE INHIBITED is output to notify the user.

The lower case a is a variable controlled by the Schedule (SCHD) Table in the Measurement Output Control Table (MOCT).

This message has seven output formats.

The format of the output message is dependent upon the report type assigned to the report name. There are ten report generator functions available as shown in the following tables.

The MEASLFT15 and SLMLFTLDAY processes listed in the Schedule Table ( in response to OP : SCHD ) are used for balancing 3B computer traffic on the ring nodes and should not be demanded with OP : SMR.

| REPORT<br>GENERATOR<br>TYPE | REPORT<br>NAME | MEANING                                               |

| CMNFLPMEX                   | NFLPMEX        | Non-fixed 5-minute exception reports. |

The full format description is found on the following pages.

### 3. VARIABLE FIELD DEFINITIONS

These reports are paginated. The page variables are the same for all formats and are:

|     |                                      |
|-----|--------------------------------------|
| #   | Report period:                       |
|     | 15 — 15 minutes                      |
|     | 30 — 30 minutes                      |
|     | HR — 1 hour                          |
|     | CDAY — Current day                   |
|     | LDAY — Last (previous) day           |
| *   | Page number of report.               |
| zzz | Total number of pages in the report. |

Format [1] variables:

|   |                                                                                                                                                                                 |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | Reporting office CLLI® code.                                                                                                                                                    |
| b | The accumulation period:<br>{DAILY   HOURLY   HALF HOURLY   FIFTEEN MINUTES}                                                                                                    |
| c | The current generic.                                                                                                                                                            |
| d | Local time zone date in a flexible, user specified format (Ex. 'month/day/year').                                                                                               |
| e | Local time zone time in 'hour:minute:second' format.                                                                                                                            |
| f | User defined string (by way of the Equipment Configuration Database [ECD]). This is the time zone indicator and has a default of Network Time (NWT) within the Continental U.S. |
| g | Network Date at beginning of accumulation period in a flexible, user specified format (Ex. 'month/day/year').                                                                   |

SEE PROPRIETARY NOTICE ON COVER PAGE

- k The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is aaa/ccc where aaa is the number of periods of accumulated data for this report and ccc is the maximum number of periods that can be covered where:  
001 <= aaa <= 288 (288 periods equals  
one day - 24 hours)  
001 <= ccc <= 288  
aaa <= ccc.
- l Group number of link in frame: 00-63.
- m Member number of link in frame: 00-15.
- n Peg count of transient errors, errors which do not result in a node being removed from service.
- o Peg count of out-of-service time due to faults; this includes all time that a node is automatically removed from service.
- p Duration of time in seconds that a node is out-of-service due to faults.
- q Peg count for manually initiated out-of-service time.
- r Duration of time in seconds that a node is manually out-of-service.
- s Peg count for out-of-service time due to ring reconfiguration that isolates this node.
- t Duration of time in seconds that a node is out-of-service due to a ring reconfiguration.
- End of Format [3] variables.

Format [4] variables:

- a Reporting office CLLI® code.
- b The accumulation period:  
{DAILY | HOURLY | HALF HOURLY | FIFTEEN MINUTES}
- c The current generic.
- d Local time zone date in 'month/day/year' format.
- e Local time zone time in 'hour:minute:second' format.
- f User defined string (by way of the ECD). This is the time zone indicator and has a default of NWT within the Continental U.S.
- g Network date at beginning of accumulation period in 'month/day/year' format.
- h Network time at beginning of accumulation period in 'hour:minute:second' format.
- i Network date at end of accumulation period in 'month/day/year' format.

| xx  | Number of bytes forced retransmitted.                                                                                                                                                            |
| yy  | Link type: SADC or DCHN.                                                                                                                                                                         |
| zz  | Pack number of link: 0 - 1.                                                                                                                                                                      |
| aaa | Port number of link: 0 - 3.                                                                                                                                                                      |
| bbb | Amount of time link is active (in hours).                                                                                                                                                        |
| ccc | Amount of time link is active (in minutes).                                                                                                                                                      |
| ddd | Peg count of out-of-service time due to faults; this includes all time that a node is automatically removed from service.                                                                        |
| eee | Peg count for manually initiated out-of-service time.                                                                                                                                            |
| fff | Signaling path failures.                                                                                                                                                                         |
| ggg | Duration of signaling path failures (in seconds).                                                                                                                                                |
| hhh | Peg count for declared link failures.                                                                                                                                                            |
| iii | Duration in seconds of declared link failures.                                                                                                                                                   |

SEE PROPRIETARY NOTICE ON COVER PAGE

jjj Peg count for temporary link failures.  
kkk Duration in seconds of temporary link failures.  
lll Number of link establishment attempts.  
mmm Messages received for an unavailable link.  
nnn Messages received with invalid address.  
ooo Transmit buffer full events.  
ppp Duration in seconds of transmit buffer full.  
qqq Number of receive buffer overloads.  
rrr Duration in seconds of received buffer overload.  
sss Successful Signaling Switchovers.  
ttt Signaling Switchover Failures.  
End of Format [5] variables.

Format [6] variables:

a Reporting office CLLI® code.  
b The current generic.  
c Local time zone date in 'month / day / year' format.  
d Local time zone time in 'hour:minute:second' format.  
e User defined string (by way of the ECD). This is the time zone indicator and has a default of NWT within the Continental U.S.  
f Network date at beginning of accumulation period in 'month / day / year' format.  
g Network time at beginning of accumulation period in 'hour:minute:second' format.  
h Network date at end of accumulation period in 'month / day / year' format.  
i Network time at end of accumulation period in 'hour:minute:second' format.  
j The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is aaa / ccc where aaa is the number of periods of accumulated data for this report and ccc is the maximum number of periods that can be covered where:  
001 <= aaa <= 288 (288 periods equals  
one day - 24 hours)  
001 <= ccc <= 288  
aaa <= ccc.

|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| k                            | Group number of RPC in frame: 00-63.                                                                                                                                    |
| l                            | Member number of RPC in frame: 00-15.                                                                                                                                   |
| m                            | Overflow peg count for level 0 (zero); this is the abatement level and indicates how many times this normal operational level was reached from a higher overflow level. |
| n                            | Overflow peg count for Level 1.                                                                                                                                         |
| o                            | Overflow time duration in seconds for Level 1 (time of n).                                                                                                              |
| p                            | Overflow peg count for Level 2.                                                                                                                                         |
| q                            | Overflow time duration in seconds for Level 2 (time of p).                                                                                                              |
| r                            | Overflow peg count for Level 3.                                                                                                                                         |
| s                            | Overflow time duration in seconds for Level 3 (time of r).                                                                                                              |
| End of Format [6] variables. |                                                                                                                                                                         |

Format [7] variables:

|   |                                                                               |
|---|-------------------------------------------------------------------------------|
| a | Report name from the Schedule (SCHD) Table.                                   |
| b | Julian date: 1 - 366                                                          |
| c | Starting data collection period: 1 - 288                                      |
| d | The number of office measurements from the User View Descriptor Table (UVDT). |
| e | The name of the measurement in the UVDT.                                      |
| f | A measurement value.                                                          |
| g | The number of LN6 measurements in the UVDT.                                   |
| h | The number of LN7 measurements in the UVDT.                                   |
| i | The link frame number.                                                        |
| j | The link member number.                                                       |
| k | Link protocol: 6 or 7.                                                        |
| l | The number of RPC measurements in the UVDT.                                   |
| m | The number of IMS User Node (IUN) measurements in the UVDT.                   |
| n | The number of channel measurements in the UVDT.                               |
| o | The channel number.                                                           |
| p | Number of link set measurements in the UVDT.                                  |
| q | Link set number.                                                              |

SEE PROPRIETARY NOTICE ON COVER PAGE

r                      Number of cluster measurements in the UVDT.

s                      Cluster number.

End of Format [7] variables.

Format [8] variables:

a                      Reporting office location.

b                      Current generic.

c                      Local home zone date in "month / day / year" format.

d                      Local home zone time in "hour:minute:second" format.

e                      Network date at the end of the accumulation period in  
"month / day / year" format.

f                      Network time at the end of the accumulation period in  
"hour:minute:second" format.

g                      Group number (0 - 63).

h                      Member number (1 - 15).

k                      Peg count errored seconds.

l                      Peg count failed seconds.

m                      Peg count bursty errored seconds.

n                      Peg count severely errored seconds.

o                      Peg count SLIPS.

p                      Peg count loss of frame.

q                      Report type:

AUTOMATIC

DEMAND

End of Format [8] variables.

#### 4. ACTION TO BE TAKEN

If either Format [2a or 3] appears, demand the report for the interval in question since the history file is complete and will produce a valid report. Use input message OP : SMR.

The remainder of the messages require no action.

c DOES NOT EXIST
- [3] OP STATUS DISKUSE STOPPED  
TOTAL OR EACH MUST BE SPECIFIED  
IF FN IS A FILE
- [4] OP STATUS DISKUSE STOPPED  
d

## 2. REASON FOR OUTPUT

To report the result of executing an OP:ST-DISKUSE input message.

## 3. VARIABLE FIELD DEFINITIONS

- a The total number of blocks in the directory or file is printed. Block size is 512 bytes.
- b Pathname of file specified in the input message.
- c Pathname of the directory which does not exist.
- d Text explaining why the command was stopped.

## 4. ACTION TO BE TAKEN

Use the OP:ST-LSTDIR input message to check the status of the file if bad status is printed. (This message implies that the file does not exist.)

Use the CLR:F-FILE input message to remove some files or the COPY:F-FILE input message to copy some files to another directory if Huge directory is printed.

Seek technical assistance if a cannot open or cannot read message is printed.

## 1. FORMAT

- [1] OP STATUS FREEDISK {STARTED|IN PROGRESS|COMPLETED}  
a b c BLOCKS d I-NODES
- [2] OP STATUS FREEDISK STOPPED  
{cannot open e |  
cannot stat e |  
e not a block device |  
e not a file system}

## 2. REASON FOR OUTPUT

To respond to the OP:ST-FREEDISK input message to print out the number of free blocks and free i-nodes available for on-line file system.

Format 1 prints when the input message is being executed or is successfully completed.

Format 2 prints when the input message is stopped by an error condition.

**NOTE:** STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

## 3. VARIABLE FIELD DEFINITIONS

out of memory}

## 2. REASON FOR OUTPUT

To report the result of executing an OP:ST-LISTDIR input command to list the contents of the file.

**NOTE:** STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Size in blocks. Printed only on STARTED or COMPLETED messages.
- b                      Size in blocks.
- c                      Type of file:  
                        d — Directory  
                        b — Block  
                        c — Character  
                        p — First-In First-Out (FIFO)  
                        - — Ordinary
- d                      Permissions. (For example, RWX = read, write and execute.)
- e                      Number of links.
- f                      Owner.
- g                      Size, specified in bytes.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                          |
|---|------------------------------------------|
| h | Current modification time.               |
| i | Filename.                                |
| j | Pathname specified in the input command. |

#### **4. ACTION TO BE TAKEN**

Refer to the input message for the correct format and reenter the command if not found is printed.

Seek technical assistance if any other error message is printed.

#### **5. REFERENCES**

OMDB Key

Formats 1 and 2 have an OMDB key of 282.

## 1. FORMAT

```
OP STATUS NSC a
 NSC b c
 .
 .
 .
 NSC b c
[NSC STATUS LIST IS INCOMPLETE]
```

## 2. REASON FOR OUTPUT

To print the status list of all equipped network services complexes (NSCs).

## 3. VARIABLE FIELD DEFINITIONS

a                      Status of output of NSC status list:

                        COMPLETED — Complete NSC status list follows.  
                        STOPPED     — NSC status list is incomplete.

b                      Member number of the NSC (0-127).

c                      Status of the NSC:

                        ACT           — Active.  
                        ACT INIP — Active with inhibit in progress.  
                        OOS           — Out-of-service.

NSC . . . INCOMPLETE = Text phrase that prints only if a = STOPPED.

## 4. ACTION TO BE TAKEN

## 1. FORMAT

- [1] OP STATUS PORTS {STARTED|IN PROGRESS|COMPLETED}  
port a owner by b
- [2] OP STATUS PORTS STOPPED

## 2. REASON FOR OUTPUT

To respond to an OP:ST-PORTS input command to output the status of each connected port.

**NOTE:** STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

## 3. VARIABLE FIELD DEFINITIONS

- a Port number.
- b Process Identification (ID) of the process connected to the port.

## 4. ACTION TO BE TAKEN

None.

## 2. REASON FOR OUTPUT

To output the status of one or more active processes.

Format 1 prints when ALL or ALLTERMS keyword was specified in the input message.

Format 2 prints when ALLKERNS keyword was specified in the input message.

Format 3 prints when PATH keyword was specified in the input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOTE:** STARTED, IN PROGRESS and COMPLETED messages appear when three or more output segments are printed.

STARTED and COMPLETED messages appear when two output segments are printed.

A COMPLETED message appears when only one output segment is printed.

### 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                                                           |
|---|---------------------------------------------------------------------------------------------------------------------------|
| a | Process status flags (in hexadecimal notation).                                                                           |
| b | Current priority of the process (in decimal notation).                                                                    |
| c | Time spent in the kernel in milliseconds (in decimal notation).                                                           |
| d | Time spent in kernel processes in milliseconds (in decimal notation).                                                     |
| e | Time spent in supervisor processes in milliseconds (in decimal notation).                                                 |
| f | Last character of the control channel (terminal) of the process (alphabetical).                                           |
| g | Process number of the process (in decimal notation).                                                                      |
| h | Utility Identification (ID) as given in the specification file for the process.                                           |
| i | Size (in bytes) of the process (in decimal notation).                                                                     |
| j | Bit pattern on which the process is sleeping (in hexadecimal notation).                                                   |
| k | Command line used to invoke the process, including any arguments passed to the process. This is in alphabetical sequence. |
| l | Execution level for the process (in decimal notation).                                                                    |
| m | Real-time clock value for a single or repetitive timeout (in hexadecimal notation).                                       |
| n | Time interval (in milliseconds) between timeouts for repetitive timeouts (in decimal notation).                           |
| o | Process event-flag word (in hexadecimal notation).                                                                        |
| p | Process control channel (in hexadecimal notation).                                                                        |
| q | Address of the Process Control Block (PCB) segment descriptor entry (in hexadecimal notation).                            |
| r | Dispatcher control table index for the process (in decimal notation).                                                     |
| s | Name of the controller or device.                                                                                         |
| t | Process number of the parent process (in decimal notation).                                                               |

## 1. FORMAT

- [1] OP STATUS SUM COMPLETED  
a b c
- [2] OP STATUS SUM STOPPED  
{Cannot open c | Read error on c}

## 2. REASON FOR OUTPUT

To output the result of executing the OP:ST-SUM input command to calculate the checksum and to report the number of blocks in a file.

## 3. VARIABLE FIELD DEFINITIONS

- a 16-bit checksum of a file (in decimal notation).
- b Number of blocks in a file (in decimal notation).
- c Pathname of the file specified in the input command.

## 4. ACTION TO BE TAKEN

Refer to the input message for the correct format and reenter the command, or check the status of the file using the OP:ST-LSTDIR input message if can't open is printed.

Seek technical assistance if read error is printed.

## 5. REFERENCES

FAILED ON KEY #k

## 2. REASON FOR OUTPUT

To give device information specific to computer hardware units on communities requested via the OP:STBY input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name. Computer unit names are listed in the Member Numbers Output Appendix C, APP:MEM-NUM-C.
- b Unit number. See Member Numbers Output Appendix C, APP:MEM-NUM-C.
- c Subunit name, if the subunit name is Control Unit (CU), CU subunit names are listed in the Member Numbers Output Appendix D, APP:MEM-NUM-D.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d Subunit number. See Member Numbers Output Appendix C, APP:MEM-NUM-C.
- e The current maintenance state of the unit is indicated by the identifiers:
- ACT — Active units.
  - GROW — Units being grown.
  - INIT — Initializing units.
  - OFL — Offline units.
  - OOS — Out-of-service units.
  - STBY — Standby units.
  - UNAV — Unavailable units.
  - UNEQIP — Unequipped units.
- f Unit status:
- ALW — Allowed.
  - INH — Inhibited.
- g Results of the last diagnostic on the unit:
- ABT — Aborted diagnostics.
  - ATP — All tests passed.
  - CATP — Conditional all tests passed.
  - NTR — No tests were run.
  - STF — Some tests failed.
- h Error number:
- 9 — Cannot attach to plant measurement library.
  - 11 — Cannot open Equipment Configuration Database (ECD) sequence.
  - 12 — Cannot sequence Unit Control Blocks (UCBs).
- i Retry the command later for the reasons:
- CANNOT CREATE FILE IN /tmp
  - CANNOT GET DATABASE RECORD ID
  - CANNOT SEQUENCE DATABASE
- j Temporary output file name.
- k Key associated with write failure.

#### 4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

## 2. REASON FOR OUTPUT

Prints in response to the OP:T1M input message.

**NOTE:** Near-end Universal Link Node (ULN) and far-end ULN test status can get out of agreement.

Because the T1 facility connecting ULNs may fail in one or both directions, it is possible that the T1 maintenance intrusive test statuses can become different or "out-of-agreement" between the Near-End (NE) ULN and the Far-End (FE) ULN at the other end of the T1 facility.

- A. As a first example, consider a case where the NE ULN's T1 transmit path is operational, but the receive path is down, at a time when a request is made to establish an intrusive test in the FE ULN. In this case, the request gets to the FE ULN, so it activates the intrusive test; but the confirming acknowledgment from the FE ULN back to the NE ULN is obstructed. The result of this scenario:
  - 1. The NE ULN times out and reports the FE intrusive test request failure to the test originator and clears the internal test-status indicators, BUT
  - 2. The FE ULN has successfully activated the requested test and marked the test as being in progress in its internal status indications.
- B. A second example: The NE ULN successfully requests the FE ULN to activate an intrusive test. Both ULN statuses show the test in progress. Then the NE ULN's receive path fails. Next, at the FE ULN, the test is deactivated using the NEULN (near-end ULN) form of the EXC:T1M IM, but the notifying message to the originator of the test via the NE ULN is obstructed (because its receive path is down temporarily). The result of this scenario:
  - 1. The NE ULN's internal status still shows the test in progress, BUT
  - 2. The test has been deactivated in the FE ULN, and the FE internal intrusive test status indicators have been cleared.

These examples demonstrate that the intrusive test status indications of the NE ULN and the FE ULN can get out of agreement. This inherent condition can result when the intrusive test requests and acknowledgments need to be sent across a T1 path that may fail in one or both directions.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOTE:** Having the NE and the FE test statuses out of agreement does not necessarily mean that the intended test procedure is being harmed or negatively affected. For example, if the FE ULN internal status indicates an activated test signal in that FE ULN, that test signal is being applied toward the NE ULN.

The difficulty/confusion arises when the tester - aware of only the NE ULN status that indicates no active test in the FE ULN - attempts to start the test and has it denied because the test (or another mutually-exclusive test) is already in progress in the FE ULN. For the safest and most enlightened operation, the tester should obtain and understand both the NE and the FE intrusive test status indications using the `OP:T1M,ST,...;NEULN;RAW` input command form.

#### PROCEDURE TO BRING INTRUSIVE TEST STATUS INTO AGREEMENT:

The ULN is designed to attempt, almost unconditionally and whenever possible, to complete the activity requested with an `EXC:T1M,...;STOP` input command, even if, for example, the NE ULN's status does not show an FE ULN test in progress.

Therefore, when the NE ULN's intrusive test status and the FE ULN's intrusive test status get out of agreement or become inconsistent, as determined by examining the `OP:T1M,ST,...;NEULN;RAW` output message for the NE and the FE ULN, then use the `EXC:T1M,...;STOP` input command form to bring the ULNs' intrusive test statuses into agreement.

Restarting the test after the failed path comes up will cause the test activity to resume, with the ULNs' test statuses in agreement.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                         |
|---|-----------------------------------------------------------------------------------------|
| a | The group number of the link node (00-63).                                              |
| b | The member number of the link node (1-15).                                              |
| c | Origination address Universal Link Node (A or Z).                                       |
| d | Destination address ULN (A or Z) or Network Channel Office Equipment (NCOE) (C - X).    |
| e | Side, Equipment or Facility (E or F). If ULN, E only. If NCOE, E or F.                  |
| f | Time interval/interval time, one of ninety-six 15-minute intervals in a 24-hour period. |
| g | Number of valid intervals in the reported data.                                         |

SEE PROPRIETARY NOTICE ON COVER PAGE

h 8-Bit current status of the T1 device. The current-status octet for the ULN T1 termination has the following per-bit indicators to show the status/health of the receive-side signal of the designated T1 termination:

|           |   |   |   |   |   |   |   |   |                |
|-----------|---|---|---|---|---|---|---|---|----------------|
|           | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | <-bit position |
| cur_stat= | U | F | R | Y | A | T | L | O |                |

The previous bit positions match the following descriptions of valid status indications:

| Octet<br>Bit<br>Pos. | Bit<br>Symbol | Description                                                                      |
|----------------------|---------------|----------------------------------------------------------------------------------|
| b7                   | U             | Set when any remaining bit is set.                                               |
| b6                   | F             | Set when unavailable-signal (alias failed signal) condition exists.              |
| b5                   | R             | Red alarm (that is, red Loss of Frame [LOF] or Carrier Failure Condition [CFC]). |
| b4                   | Y             | Yellow alarm signal detected on Extended Super Frame-Data Loopback (ESF-DL).     |
| b3                   | A             | Blue alarm indication signal (LOF/CFC).                                          |
| b2                   | T             | Not used.                                                                        |
| b1                   | L             | Test signal or payload loopback activated on transmit side.                      |
| b0                   | O             | Loss of Signal/Line Format Violation Rate (LOS/LFVR) alarm state.                |

For invalid status indications. U-bit not set, and the following values are recorded on the remaining bits:

|    |   |                                                                  |
|----|---|------------------------------------------------------------------|
| b7 | U | Bit NOT set; bit=0.                                              |
| b3 | A | Request denial between ULNs (new for ULN).                       |
| b2 | T | No response by NCOE from a far-end entity.                       |
| b1 | L | Set by NCOE when equipment Interface Unit (IU) is not available. |
| b0 | O | Set by NCOE when an illegal request is received.                 |

When b3, the A-bit is set, a REASON CODE octet immediately follows the cur\_stat octet. This code indicates the reason for denial/failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

i Extra data sent from the near-end ULN only, T1 specific (for RAW option).

XST1 is 32-bits wide. The bits are numbered 0 through 31, with the zero bit position being the rightmost one. XST1 is printed as a hexadecimal number, with each digit representing four bits.

Bits 7 through 0, the rightmost two digits, indicate which NEAR-END loopback condition or test signal is activated, as follows:

|    |                                                     |
|----|-----------------------------------------------------|
| b7 | Yellow test signal activated                        |
| b6 | Spare                                               |
| b5 | Line loopback (toward facility) activated           |
| b4 | Quasi-Random test signal activated                  |
| b3 | All zeroes test signal activated                    |
| b2 | Low-density test signal activated                   |
| b1 | High-density test signal activated                  |
| b0 | Data (payload) loopback (toward facility) activated |

Bits 15-8, the second and third digits from the right, show the near-end ULN's view/status of which FAR-END loopback condition or test signal is activated at the far-end ULN, as follows:

|     |                                                     |
|-----|-----------------------------------------------------|
| b15 | Yellow (4-Kb ESF-DL) test signal activated          |
| b14 | Spare                                               |
| b13 | Line loopback (toward facility) activated           |
| b12 | Quasi-Random test signal activated                  |
| b11 | All zeroes test signal activated                    |
| b10 | Low-density test signal activated                   |
| b9  | High-density test signal activated                  |
| b8  | Data (payload) loopback (toward facility) activated |

Bits 16 through 31 provide T1-specific internal state information for technical assistance.

**NOTE:** Additional raw data definition intended for use ONLY by technical assistance associated with Intrusive Test Transaction Control.

SEE PROPRIETARY NOTICE ON COVER PAGE

|        |                                                                                         |
|--------|-----------------------------------------------------------------------------------------|
| b19-16 | Spare.                                                                                  |
| b23-20 | Major Capabilities (MJC) state table: previous state from Cbnmjc_prevst variable.       |
| b27-24 | Near-End Non-Intrusive (NENI) state table: previous state from Cbnneni_prevst variable. |
| b31-28 | Remote Non-Intrusive (RENI) state table: previous state from Cbnreni_prevst variable.   |

XST2 is 32-bits wide. The bits are numbered 0 through 31, with the zero bit position being the rightmost one. XST2 is also printed as a hexadecimal number, with each digit representing four bits:

|        |                                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------|
| b0-19  | T1-specific internal state information for technical assistance. These are the rightmost three digits. |
| b20-31 | Spare                                                                                                  |

**NOTE:** Additional raw data definition intended for use ONLY by technical assistance associated with Major Capabilities Control and Non-Intrusive Transactions Control.

|        |                                                                                         |
|--------|-----------------------------------------------------------------------------------------|
| b0-7   | Near-End Intrusive Test (NEIT) state table: previous state from Cbnneit_prevst variable |
| b8-11  | Far-End Intrusive Test (FEIT) state table: previous state from Cbnfeit_prevst variable  |
| b15-12 | Near-end 4K (NE4K) (ESF-DL) state table: previous state from Cbnne4k_prevst variable    |
| b19-16 | Far-end 4K (FE4K) (ESF-DL) state table: previous state from Cbnfe4k_prevst variable     |

XST3 is 32 bits wide, with bits numbered 31-0, and the 0-bit position is the rightmost one. XST3 is printed as a hexadecimal number, where each hexadecimal digit represents four bits.

XST3 carries Link Processor (LP) T1 Device Handler status and control information.

SEE PROPRIETARY NOTICE ON COVER PAGE

For bits 3-0, the rightmost hex digit, bit subsets are defined in binary form to mean:

b01-00 Active Clock Control Value (activated by LP):

**NOTE:** Active Clocking set to equal LN DATA value described, when LN DATA value is not zero (00). Otherwise, active clocking set to equal BACKPLANE/CABLE value:

00 = not specified; unexpected, erroneous value.

01 = master clocking specified.

10 = slave clocking specified.

b03-02 BACKPLANE/CABLE Clock Control Value:

00 = not specified; unexpected, erroneous value.

01 = master clocking specified.

10 = slave clocking specified.

Therefore, "Valid/Expected" rightmost hex-digit values, in binary and hex, with their meanings, are as follows:

|         |          | CABLE CLK | ACTIVE CLK |
|---------|----------|-----------|------------|
| b(0101) | = 0x5 => | master    | master     |
| b(0110) | = 0x6 => | master    | slave      |
| b(1001) | = 0x9 => | slave     | master     |
| b(1010) | = 0xA => | slave     | slave      |

Bits 7-4, the second hex-digit from the right, subsets are defined in binary form to mean:

b05-04 LN DATA Clock Control Value:

(derived from clndata data base element t1\_clock\_mode)

00 => t1\_clock\_mode value invalid or unexpected;  
BACKPLANE/CABLE Clock Control Value used for clock control

01 => LN Data master clocking specified

10 => LN Data slave clocking specified

b07-06 Unused Spare; values have no specific meaning.

SEE PROPRIETARY NOTICE ON COVER PAGE

Therefore, "Valid/Expected" second from right hex-digit values, in binary and hex, with their meanings, are as follows:

MTCE (SW) CLK  
b(0000) = 0x0 => Valid LN Data clock control not specified;  
BACKPLANE/CABLE clock control value is used  
b(0001) = 0x1 => master clocking specified  
b(0010) = 0x2 => slave clocking specified

**NOTE:** Additional raw data definition intended for use ONLY by technical assistance if alarm reporting inconsistencies should occur and need to be resolved, or line loopback activation or deactivation coded signals appear to be applied in error.

b11-8 The third hex digit from the right, indicates receive (signal) alarm status  
b15-12 The fourth hex digit from the right, indicates Xmit alarm status  
b19-16 The fifth hex digit from the right, contains the Status of Line Loopback (LLB) Activation or Deactivation signals

LLB Activate Signal is a full bandwidth (1.544 Mb/s) repeating one in five pattern (00001), with arbitrary values (1 or 0) in every 193rd bit position overwriting the pattern.

LLB Activate Signal is a full bandwidth (1.544 Mb/s) repeating one in three pattern (001), with arbitrary values (1 or 0) in every 193rd bit position overwriting the pattern.

To activate a remote LLB at an intermediate point on the T1 facility or at the far-end point of the facility, the near-end ULN will transmit the LLB Activate Signal for an interval of approximately 10-20 seconds. When the remote or far-end T1 termination detects this "LLB Activate" signal, it activates its LLB.

Similarly, to activate a remote LLB at an intermediate point on the T1 facility or at the far-end point of the facility, the near-end ULN will transmit the LLB Deactivate Signal for an interval of approximately 7-15 seconds. When the remote or far-end T1 termination detects this "LLB Deactivate" signal, it deactivates its LLB.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOTE:** These Activation and Deactivation coded signals are normally sent for ONLY SHORT INTERVALS (less than 22 seconds) to request the receiving T1 termination to either activate or deactivate its LLB. These coded signals are NOT being sent for the entire interval while the LLB is actually activated or deactivated.

- b16 LLB Activate Signal is being received (requests the receiving T1 termination to activate its LLB)
- b17 LLB Deactivate Signal is being received (requests the receiving T1 termination to deactivate its LLB)
- b18 LLB Activate Signal is being transmitted (requests a remote or far-end T1 termination on the facility to activate its LLB)
- b19 LLB Deactivate Signal is being transmitted (requests a remote or far-end T1 termination on the facility to deactivate its LLB)

j Duration of the current interval.

**NOTE:** When far-end performance data are collected, the near end does NOT receive an actual interval duration from the far end for the historical intervals. The messages and protocol do not provide for conveying the historical interval duration from the far end to the near end, so the duration for all far-end historical intervals is automatically/arbitrarily set to 900 seconds as the best "estimated" duration of the far-end historical intervals.

When the actual duration of an historical interval is important, use the OP:T1M, . . . NEULN input command form, when possible, to get the actual duration of the historical interval of interest.

k The count of the specific error which includes:

Errored Seconds (ES) is a second with one or more: CRC6 checksum errors, Out-Of-Frame (OOF) conditions, or slip events.

Failed Seconds (FS) is also called an Unavailable Seconds (UAS) and is a second during which: one Loss-Of-Frame (LOF) occurs, or the failed signal state is entered, following ten consecutive Severely-Errored Seconds (SES).

Bursty-Errored Seconds (BES) is a second with one <CRC6 errors <320.

Severely Errored Seconds (SES) is a second with 320 or more CRC6 errors, or one or more OOF conditions, or one or more slip events.

Controlled- SLIP Seconds (SLIPS) is also called a slip event and is a second with the occurrence of slip buffer overflow or underflow.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                |

#### 4. ACTION TO BE TAKEN

Formats 1-11, None.

Format 12, Try the command again. If the problem persists with the FEULN command form, then try the NEULN command form on the far-end ULN. This form can work even if the ULN T1 link has failed. If neither form works, seek technical assistance.

Formats 13-16, Try the command again. If the problem persists, seek technical assistance.

- [3] OP TRACE COMPL

## 2. REASON FOR OUTPUT

This message is in response to the OP : TRACE input message.

## 3. VARIABLE FIELD DEFINITIONS

- a                   ACTIVE or INACTIVE.
- b                   Processor 3B or NP.
- c                   ALL.  
                    NONE.  
                    Node identity: name unit e.g., IUN32 1.  
                    Slot identity: name unit slot e.g., IUN32 1 (1).
- d                   Subsystem identifier.
- e                   Detail flags in hexadecimal.

## 4. ACTION TO BE TAKEN

None.

## 2. REASON FOR OUTPUT

This message is in response to an OP:TRAP input message.

Format 1 prints if only OP:TRAP is given (i.e. no other keyword has been specified), the status information as detailed in this format will be printed for all existing traps on the message trap system.

Format 2 prints if no trap Identification (ID) has been given and LFORM Y is specified, the status information as detailed in this format will be printed for all existing traps on the Message Trap system.

Format 3 prints if only a trap ID has been given, the status information and any trap results as detailed in this format will be printed for the specified trap.

Format 4 prints individual trapped messages, if any, will be displayed in this format. It has the message trap header information in user-friendly format and the content of the trapped message in enhanced buffer dump format.

Format 5 prints if only OP:TRAP is given (i.e. no other keyword has been specified) and there is no trap on the Message Trap system, this format will be printed.

Format 6 prints if no trap ID has been given and DEST is specified, this format will be used to acknowledge the OP:TRAP input message. The trap status information as detailed in Format [1] will be displayed in the specified destination output class.

Format 7 prints this format results when only OP:TRAP is given (i.e. no other keyword has been specified) and the processing of the input message has failed due to the reason being displayed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 8 prints if only a trap ID has been given, normally the status information and any trap results as detailed in Format [3] will be printed for the specified trap. In this format, only the trap status information will be printed since no message has been collected for this trap.

Format 9 prints if only a trap ID has been given, the status information and any trap results as detailed in Format [3] will be printed for the specified trap. This format serves as a positive acknowledgement to the input message which has been successfully processed to completion.

Format 10 prints this format results when a trap ID has been given (other keywords may have been specified as well) and the processing of the input message has failed due to the reason being displayed.

Format 11 prints if a trap ID has been given and DEST is specified, this format will be used to acknowledge the OP:TRAP input message. The trap status information and any trap results as detailed in Format [3] will be displayed in the specified destination output class.

Format 12 prints if a trap ID has been given and RTDSP is specified with Y or N option, this format will be printed to acknowledge the input message which has been processed successfully.

Format 13 prints if a trap ID has been given and LFORM is specified with Y or N option, this format will be printed to acknowledge the input message which has been processed successfully.

Format 14 prints if a trap ID has been given and LFORM is specified with Y or N option, this format will be printed to acknowledge the input message which has not been processed successfully.

Formats 15-25 prints decoded result of the particular trapped message.

**NOTE:** In Format 15, in some ISDN7 messages the names of some fields may be meaningless.

**NOTE:** In Format 16, in UDTs messages, PCLASS is replaced by DGPAR.

**NOTE:** In Format 16, in SCCP messages other than UDT and UDTs the names of some fields such as MTYPE may be meaningless.

**NOTE:** In Format 18, in SNM7 messages with a Message Group of CHM, ECM or MIM the AFFPC field is not present and will not be printed.

**NOTE:** In Format 20, when the RF=0, the RC and RTAD are not valid.

**NOTE:** In Format 23, NM6 is printed for all messages whose HDGINF field begins with binary 111.

Please refer to the SET:TRAP IM page for more details on the input parameters that can be given in a SET:TRAP input message.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a                    Trap Identification (ID).
- b                    Trap state:
- ABT — Aborted trap.
- ACT — Active trap.
- CMP — Completed trap.
- INH — Inhibited trap.
- PND — Pending trap.
- TRM — Terminated trap.
- c                    Termination reason:
- 0 —     Unspecified.
- 1 —     The trap has gone to completion gracefully (due to message count).
- 2 —     The trap has gone to completion gracefully (due to duration).
- 3 —     Craft initiated STOP : TRAP.
- 4 —     Inhibited for too long; abort trap.
- 5 —     Resource problem at the 3B computer.
- 6 —     Frequency of disk write at the 3B computer exceeds threshold.
- 7 —     Disk space exhausted in "no overwrite" mode.
- 8 —     MTRP incore buffers unavailable during disk\_write .
- 9 —     CNI level 1 initialization has occurred
- 10 —    Trap aborted at all concerned link node(s); due to resource or congestion problem(s) at link node(s).
- 11 —    All concerned link nodes are OOS.
- 12 —    All concerned link nodes are either OOS or have aborted the trap.
- 13 —    Problem occurred during status check or audit.
- d                    Rate of trapping.
- e                    Starting time of trap in hh:mm mo / day.
- f                    Ending time of trap in hh:mm mo / day.
- g                    Realtime display:
- N —     No
- Y —     Yes

SEE PROPRIETARY NOTICE ON COVER PAGE

h Saving of collected messages on disk:

N — No

Y — Yes

i Number of trapped messages collected.

**NOTE:** The number of messages collected for a trap may exceed the number of messages requested in the MCNT parameter. This is due to the fact that a trap can be set on several nodes and the central processor (3B20D/3B21D) maintains a cumulative count of the messages collected from all the nodes. When this cumulative count in the 3B20D/3B21D exceeds MCNT value, 3B20D/3B21D sends a message to all the nodes to stop the trap. But by then, the nodes might have sent some additional trapped messages to the 3B20D/3B21D. These additional messages are not discarded, but are included as part of the trap result.

If the trap is set on only one node, excess messages may result for the following reason. Once every second, each node sends to the 3B20D/3B21D all messages trapped during that one second period. The messages collected at the 3B20D/3B21D at a given time (in seconds) may be less than the MCNT field. But immediately after the next second, the messages collected may exceed the specified MCNT value. The 3B20D/3B21D, then, sends a message to the node to stop the trap.

j List of Link Numbers in gg-mm format. These links are currently affected by this trap.

If no link is currently affected by this trap, the following will be printed: NO AFFECTED LINK

k Rate of trapping. Default value not given in SET:TRAP input message; default used.

l Duration of trapping in hh,mm format. Default value not given in SET:TRAP input message; default used.

m Number of trapped messages to be collected. Default value not given in SET:TRAP input message; default used.

n Number of minutes to start the trap from the time when the SET:TRAP input message was entered. IMMD trap was to be started immediately after the SET:TRAP input message was entered.

o Realtime display. Default value not given in SET:TRAP input message; default used.

N — No

Y — Yes

SEE PROPRIETARY NOTICE ON COVER PAGE

- p Saving of collected messages on disk:  
N — No  
Y — Yes
- q Output class for output of trap information.
- r Maximum trapped message size (in bytes) that will be saved and displayed.
- s Link information given in SET:TRAP input message  
LNKLST — Link list values were given.  
LNKR — Link range value was given.  
LNKSET — Link set value was given.
- t Link information given in SET:TRAP input message, this value is dependent on what the previous variable's value is:  
LNKLST — Number of links is printed next to LNKLST; and the list of links in gg-mm format is printed on the next line.  
LNKR — Link range in gg-mm, gg-mm format is printed.  
LNKSET — Link set value is printed.
- u Keywords of parameters as given in SET:TRAP input message:  
BNMf1, CDGT1f1, CDGT2f1, CDPCf1, CDSnf1, CDTf1, CGGT1f1, CGGT2f1, CGPCf1, CGSNf1, CGTf1, DESAf1, DESBf1, DMIf1, DOMf1, DPCf1, MODE f1, MTYPEf1, OFSTBf1, OPCf1, RCf1, RFRf1, RTADf1, SOPCf1, VLNf1.  
  
**NOTE:** CGGT1 gives high order 2 bytes of CGGT.  
CGGT2 gives low order 4 bytes of CGGT.  
CDGT1 gives high order 2 bytes of CDGT.  
CDGT2 gives low order 4 bytes of CDGT.  
  
CGGT and CDGT are used in the SET:TRAP input message.
- v Offset value in hexadecimal when previous value is OFSTB
- w Bit Pattern value in hexadecimal. Depends on keyword of parameters given:  
  
When MTYPE, it can be taken from the following set:  
ALL6, ALL7, BAND6, DCIS, DS6, ECIS7, ISDN7, NM6, NM67, MREG7, MSPEC7, SCCP, SNM7.  
  
When MODE, it can be taken from the following set:  
INCOMING, OUTGOING
- x Bit Mask value in hexadecimal
- y Length of trapped message in bytes

w1

Message type for ISDN messages:

ACM — Address complete.  
ANM — Answer.  
BLA — Blocking acknowledgement.  
CCR — Continuity check request.  
CFN — Confusion.  
CGB — Circuit group blocking.  
CGBA — Circuit group blocking acknowledgement.  
CMC — Call modification completed.  
CMRJ — Call modification reject.  
CMR — Call modification request.  
CON — Connect.  
CPG — Call progress.  
CQM — Circuit query.  
CQR — Circuit query response.  
CRA — Circuit reservation acknowledgement.  
CRM — Circuit reservation.  
CSV — Closed user group selection and validation request.  
CSVSR — Closed user group selection and validation response.  
CVR — Circuit validation test response.  
CVT — Circuit validation test.  
DRS — Delayed release.  
EXM — Exit.  
FAA — Facility accepted.  
FAD — Facility deactivated.  
FAI — Facility information.  
FAR — Facility request.  
FOT — Forward transfer.  
FRJ — Facility reject.  
GRA — Circuit group reset acknowledgement.  
GRS — Circuit group reset.  
IAM — Initial address.  
INF — Information.  
INR — Information request.  
LPA — Loop-back acknowledgement.  
OLM — Overload.  
PAM — Pass along.  
REL — Release.  
RES — Resume.  
RLC — Release complete.  
RSC — Reset circuit.  
RSVP — RSVP message.  
RSVR — RSVP reply.  
SAI — SDN SID / ANI increment.  
SAM — Subsequent address.  
SSD — Second start redial.  
SUS — Suspend.  
UBL — Unblocking.  
UCI — Unequipped CIC.

                            SLT — Signaling link test message.  
                            SLTA — Signaling link test message acknowledgement.

#### **4. ACTION TO BE TAKEN**

Format 7 Try again later (at least a minute).

Format 10 If an internal error condition occurs, seek technical assistance; otherwise, message is self-explanatory.

Format 14 Try again later (at least 3 minutes).

All other formats no action to be taken.

## 2. REASON FOR OUTPUT

The report from the OP:TSC input command will be contained in a single output block preceded by time and date information. The output format will vary, depending on which input option was given.

Messages print in response to OP:TSC(NODE) or OP:TSC(DCHN) input commands.

Format 1 prints in response to OP:TSC(NODE) input message.

Format 2 prints in response to OP:TSC(DCHN) input message.

Formats 3-8 prints in response to ERROR outputs.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                                                                                              |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | Group number (0-63).                                                                                                                                         |
| b | Member number (1-15).                                                                                                                                        |
| c | Total number of TSC connections for this node (0-256).                                                                                                       |
| d | Congestion Level at this DCHN node:<br>0 — No congestion.<br>1-2 — Congestion is at this level.                                                              |
| f | Card number (0-1). There are 2 LI4 cards on each node, with each card terminating 4 D channels. Cards are numbered 0 to 1, referring to one of the two LI4s. |
| g | Port number (0-3). Ports are numbered 0 to 3, referring to one of the four D channels on an LI4 card.                                                        |
| h | Logical Access ID (LACID) low range: 1-255, high range: 1024-1279.                                                                                           |
| i | Total number of connections on this D channel (0-256).                                                                                                       |
| j | Number of provisioned TSC on this D channel (in multiples of 16).                                                                                            |
| k | Group Number (0-63).                                                                                                                                         |
| l | Member Number (1-15).                                                                                                                                        |
| m | Card Number (0-1).                                                                                                                                           |
| n | Port Number (0-3).                                                                                                                                           |
| o | LACID low range: 1-255, high range: 1024-1279.                                                                                                               |
| p | Type of D channel:<br>PRIMARY<br>SECOND<br>SIMPLEX                                                                                                           |
| q | Total number of active connections on this D channel (0-256).                                                                                                |
| r | Number of provisioned TSC on this D channel (in multiples of 16).                                                                                            |

| t  | Day the TSC was established, e.g., 04/17/91.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| u  | Time the TSC was established, e.g., HH:MM:SS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| v  | Call Reference Value (1-0xFFFF) as included in message sent from 4E to PBX. 4E sends CRV with flag=0 if 4E is the originator on this interface. 4E sends CRV with flag=1 if 4E is the destination on this interface.                                                                                                                                                                                                                                                                                                                                                                      |
| w  | Associated B channel (interface ID, 0-31).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| x  | Associated B channel (Channel ID, 1-24).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| y  | Destination Point Code (DPC). This destination point code consists of a string of 9 decimal digits (NNNRRRCMMM); digits NNN designate the Network ID, digits RR designate region, digit C designates cluster, digits MMM designate member.                                                                                                                                                                                                                                                                                                                                                |
| z  | Destination Local Reference Number (DLRN) (0 - 0xFFFFF). The DLRN is the number by which the network identifies the far-end of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| a1 | Source Local Reference Number (SLRN) (0 - 0xFFFFF). The SLRN is the number by which the network identifies the local end of the connection.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| b1 | Indicates the current status of this TSC connection:<br><br>DATATRNSFR — Data transfer ready.<br>INCONPEN — Incoming connection pending.<br>LOCALRESET — Local user initiated reset pending.<br>LOCDISCPEN — Local end disconnect pending.<br>OUTCONPEN — Outgoing connection pending.<br>REMRESET — Remote end reset pending.<br>RLSEHOLD — Connection release on hold.                                                                                                                                                                                                                  |
| c1 | Congestion Status of this connection (0 - 0xFF). This is a bit-field that contains the congestion information for this connection. A 0 in a bit indicates no congestion of this type, a 1 indicates there is this type of congestion. A value of 0x00 indicates there is no congestion.<br><br>BITS: 7 6 5 4 3 2 1 0<br><br>Bit 7 — Spare.<br>Bit 6 — Data send window congestion, marked to discard messages (unack ≥ 16).<br>Bit 5 — Data send window congestion (unack ≥ 8) - (unack < 16).<br>Bit 4 — Far-end congestion (0=OFF, 1=ON).<br>Bit 3 — Near-end congestion (0=OFF, 1=ON). |

SEE PROPRIETARY NOTICE ON COVER PAGE

Bit 2 — Local node congestion (0=OFF, 1=ON).  
Bit 1 — User connection congestion (0=OFF, 1=ON).  
Bit 0 — Local User TSC congestion (0=OFF, 1=ON).

d1

Activity indicator of connection:

- 0 Connection has been inactive for 60 minutes.
- 1 Connection is currently active.

## 2. REASON FOR OUTPUT

To report the disposition of an OP:UMEM input message.

## 3. VARIABLE FIELD DEFINITIONS

- a Indicates which file operation failed:
  - CREATE
  - OPEN
  - READ
- b DIAGNOSTICS TRACE INFORMATION. Indicates file for which operation failed.
- c Generic Access Package (GRASP) execution sequence number.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d Termination status.
- COMPLETED — The data has been dumped to the file as indicated.
- STOPPED UCERR — The utility circuit either does not respond or does not match the circuit present when the trace was defined.
- e Number of lines written to the file.
- f Name of the file to which the output was written.
- g Circuit type from which the information was taken.
- h Control Unit (CU) for which last trace was defined (0-1).

#### 4. ACTION TO BE TAKEN

The file into which the information was written should be removed after it has been examined.

If a is STOPPED UCERR, check the utility circuit hardware. After it is fixed, use initiative to reinitialize the circuit.

- [7] OP UNAV RETRY LATER i
- [8] OP UNAV WRITE TO j  
FAILED ON KEY #k

## 2. REASON FOR OUTPUT

To give device information specific to hardware units on communities requested via the OP:UNAV input message. The format is consistent with related maintenance messages.

The exit status of this report is indicated by either the successful COMPLETED message or the unsuccessful INTERFACE ERROR message.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name. Administrative Module (AM) unit names are listed in the Member Numbers Output Appendix C, APP:MEM-NUM-C.
- b Unit number. See Member Numbers Output Appendix C, APP:MEM-NUM-C.
- c Subunit name, if subunit name is CU, Control Unit (CU) subunit names are listed in Member Numbers Output Appendix D, APP:MEM-NUM-D.
- d Subunit number. See Member Numbers Output Appendix C, APP:MEM-NUM-C.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e The current maintenance state of the unit is indicated by the identifiers:
- ACT — Active units.
  - GROW — Units being grown.
  - INIT — Initializing units.
  - OFL — Offline units.
  - OOS — Out-of-service units.
  - STBY — Standby units.
  - UNAV — Unavailable units.
  - UNEQIP — Unequipped units.
- f Indicates the current inhibit status of the associated error source:
- ALW — Allowed.
  - INH — Inhibited.
- g Results of the last diagnostic on the unit:
- ABT — Aborted diagnostics.
  - ATP — All tests passed.
  - CATP — Conditional all tests passed.
  - NTR — No tests were run.
  - STF — Some tests failed.
- h Error number:
- 9 — Cannot attach to plant measurement library.
  - 11 — Cannot open Equipment Configuration Database (ECD) sequence.
  - 12 — Cannot sequence Unit Control Blocks (UCBs).
- i Retry the command later for the reasons:
- CANNOT CREATE FILE IN /tmp
  - CANNOT GET DATABASE RECORD ID
  - CANNOT SEQUENCE DATABASE
- j Temporary output file name.
- k Key associated with write failure.

#### 4. ACTION TO BE TAKEN

If error numbers 11 or 12 are indicated, the system is still initializing and the input message should be retried.

NODE STATUS  
LNa b c  
.  
.  
.  
LNa b c  
d  
e  
OP UPD COMPL

## 2. REASON FOR OUTPUT

Format 1 prints in response to an OP:UPD input message. Prints when there are 30 or fewer D-channel nodes being reported on.

Format 2 prints when there are more than 30 D-channel nodes being reported on.

SEE PROPRIETARY NOTICE ON COVER PAGE

a The group number of the link node, with a valid range from 00 to 63.

b The member number of the link node, with a valid range from 1 to 15.

c A suitable response explaining the status. Must be one of the following:

UPDATE PENDING  
UPDATE IN PROGRESS  
UPDATE SUCCESSFULLY COMPLETED  
UPDATE ABORTED - NODE NOT IN ACT MAJOR STATE  
UPDATE ABORTED - STOP UPDATE REQUESTED  
UPDATE ABORTED - NODE MOVED OUT OF ACT STATE DURING UPDATE  
UPDATE ABORTED - PUMPER RE-CREATION COUNT EXCEEDED  
UPDATE ABORTED - PUMPER REPORTED FAILURE  
UPDATE ABORTED - PUMPER TIMED OUT  
UPDATE ABORTED - CHECKSUM NOT ACKNOWLEDGED  
UPDATE ABORTED - CHECKSUM FAILURE  
UPDATE ABORTED - SLMK COMMUNICATION FAILURE  
UPDATE ABORTED - FAILED TO GET NODE'S GSF ID  
UPDATE ABORTED - UPDATE ERRLOG SITUATION  
UPDATE FAILED - XFER REQUEST ACKNOWLEDGED, QUERY REPORTED FAILURE  
UPDATE FAILED - XFER REQUEST ACKNOWLEDGED, QUERY NOT ACKNOWLEDGED  
UPDATE FAILED - XFER REQUEST NOT ACKNOWLEDGED, QUERY REPORTED FAILURE  
UPDATE FAILED - XFER REQUEST NOT ACKNOWLEDGED, QUERY NOT ACKNOWLEDGED  
UPDATE FAILED - NODE MOVED OUT OF ACT STATE IMMEDIATELY AFTER SUCCESSFUL UPDATE  
UPDATE FAILED - UPDATE ERRLOG SITUATION  
UPDATE NOT ATTEMPTED

d An explicit status of the last UPD:DCHN request command. Must be one of the following:

UPDATE JOB NEVER EXECUTED  
UPDATE JOB IS CURRENTLY EXECUTING  
UPDATE JOB COMPLETED  
UPDATE JOB STOPPED, STOP UPDATE REQUESTED  
UPDATE JOB ABORTED, SLMK COMMUNICATION FAILED  
UPDATE JOB ABORTED, PUMPER CREATION FAILURE  
UPDATE JOB ABORTED, PUMPER RE-CREATION COUNT EXCEEDED  
UPDATE JOB ABORTED, PUMPER GUARD TIMER TIMED OUT  
UPDATE JOB ABORTED, EXCESSIVE NODE UPDATE FAILURES  
UPDATE JOB ABORTED, EXCESSIVE RING COMMUNICATION FAILURES  
UPDATE JOB ABORTED, RING DOWN  
UPDATE JOB ABORTED, UPDATE ERRLOG SITUATION

e                      A string for the time of the last UPD completion. For example, MON  
JUN 27 04:31:19 1994.

[2] OP UTIL NOT STARTED

INVALID ACTION FIELD INVALID KEYWORD

[3] OP UTIL NOT STARTED

RETRY LATER THE SYSTEM IS IN AN OVERLOAD CONDITION

## 2. REASON FOR OUTPUT

To print a summary status report of the Generic Access Package (GRASP). This is in response to an OP:UTIL input message. The effective values of the dynamic and static thresholds, defined breakpoints and their attributes, and the transfer trace attributes are printed.

## 3. VARIABLE FIELD DEFINITIONS

- a Threshold value of dynamic real time usage at which GRASP will take overload recovery. Expressed as a percentage.
- b Interval of time over which GRASP real time usage is accumulated. Expressed in milliseconds.
- c Length of time of debugging inactivity through which GRASP will wait before terminating itself. Expressed in minutes.
- d Breakpoint number.
- e Utility ID (UID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a process ID instead of a utility ID.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                                                                                                                                                              |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f | Process ID (PID) of the process in which the breakpoint is planted. The value is enclosed in parentheses if the breakpoint definition specified a utility ID instead of a process ID. The field will be blank if no suitable process has been found.         |
| g | Address of the breakpoint.                                                                                                                                                                                                                                   |
| h | Length of the match interval. Execution breakpoints indicate one byte.                                                                                                                                                                                       |
| i | Breakpoint condition as specified in the WHEN input message.                                                                                                                                                                                                 |
| j | Implementation of the breakpoint.<br>H — Hardware implemented breakpoints.<br>(*) — Range matcher is marked with an asterisk.<br>(#) — Hardware execution matcher is marked with a pound sign.<br>(blank) — Software implemented breakpoints are not marked. |
| k | Breakpoint state:<br>DISABLED<br>ENABLED                                                                                                                                                                                                                     |
| l | Stop condition of the trace:<br>CIRC — The trace will run indefinitely, replacing the oldest data with the newest.<br>STOP FULL — The trace will stop when the memory fills up.                                                                              |
| m | Utility ID to which the trace is restricted. The value will be enclosed in parentheses if the INIT:UMEM message specified a process ID. If no restriction was given, will be blank.                                                                          |
| n | Process ID to which the trace is restricted. If no PID restriction was given, will be blank.                                                                                                                                                                 |
| o | Beginning address to which the trace is restricted.                                                                                                                                                                                                          |
| p | Length of the address interval to which the trace is restricted.                                                                                                                                                                                             |
| q | Storage mode:<br>DATA<br>DFPAR<br>DTRANS<br>FPARAM<br>TRANS<br>UID                                                                                                                                                                                           |

## 1. FORMAT

This message has 22 formats.

- [1] OP VTOP ABORTED. CANNOT FIND PROCESS UID= a
- [2] OP VTOP ABORTED. ERROR INITIALIZING SPY
- [3] OP VTOP ABORTED. ERROR READING DCT COUNT
- [4] OP VTOP ABORTED. Unable to open /dev/pmem
- [5] OP VTOP ABORTED. Unable to read low core.
- [6] OP VTOP ABORTED. Unable to read kernel sgt.
- [7] OP VTOP ABORTED. Address out of range.
- [8] OP VTOP ABORTED. Invalid segment.
- [9] OP VTOP ABORTED. Unable to seek to page entry.
- [10] OP VTOP ABORTED. Unable to read page entry.
- [11] OP VTOP ABORTED. Desired address not in core.
- [12] OP VTOP ABORTED. Process id out of range.
- [13] OP VTOP ABORTED. Process does not exist.
- [14] OP VTOP ABORTED. Unable to seek sgt for process b.
- [15] OP VTOP ABORTED. Unable to read sgt for process b.
- [16] OP VTOP ABORTED. Process is not in memory.
- [17] OP VTOP ABORTED. Unable to seek to page.
- [18] OP VTOP ABORTED. Unable to read pcb at location c.
- [19] OP VTOP ABORTED. Failed to read d bytes at physad e  
parsing message.

SEE PROPRIETARY NOTICE ON COVER PAGE

- [20] OP VTOP- UID a VIRTUAL ADDRESS f --  
PHYSICAL ADDRESS=g
- [21] OP VTOP- PID b VIRTUAL ADDRESS f --  
PHYSICAL ADDRESS=g
- [22] OP VTOP- KERN VIRTUAL ADDRESS f  
PHYSICAL ADDRESS=g

## 2. REASON FOR OUTPUT

To report the result of executing an OP:VTOP command that had been successfully parsed.

## 3. VARIABLE FIELD DEFINITIONS

- a Input utility id.
- b Input process id.
- c Address that attempted to read pcb from.
- d Number of bytes attempted to read.
- e Memory location where attempted to read.
- f Input virtual address.
- g Output physical address.

## 4. ACTION TO BE TAKEN

The last three messages indicate a successful command. The remaining messages indicate some error. Check input information.

## 5. REFERENCES

ID ..... ORD:SCSD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] ORD SCSD UNIT a PT b[bbbbbbb] f g
- [2] ORD SCSD GRPN c DUPID d PT e[eeeeee] f g
- [3] ORD SCSD NOT STARTED  
CONFLICT WITH CURRENT SYSTEM STATUS

## 2. REASON FOR OUTPUT

To indicate the result of a distribute operation requested by an ORD:SCSD input message. The operations are: set, clear, flash for eight seconds, and flash continuously.

Format 1 is used when a distribute point is identified by physical location.

Format 2 is used when a distribute point is identified by logical address.

Format 3 indicates the Scanner and Signal Distributor (SCSD) administration process is not active. No communication with SCSD points is possible.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number of SCSD unit.
- b Physical scan point number on an SCSD (0-31).
- c Name of the logical group.
- d Duplex group ID (0-1).
- e Number of a point within a logical group.
- f Distribute operation.
  - OPERATE — Set.
  - RELEASE — Clear.
  - REPEAT — Flash continuously.
  - STEP — Flash for eight seconds, which it terminates in the cleared state.

SEE PROPRIETARY NOTICE ON COVER PAGE

- g Termination status.
- COMPLETED — Action completed.
- FAILED — Action could not be completed by SCSD administrator:
- SCSD unit number is invalid.
  - Point number is invalid for the logical group. If more than one point number is specified, at least one of them is invalid. Operation will complete for all valid point numbers if there are no other errors.
  - Logical group name is invalid and either the SCSD unit is Out Of Service (OOS) or is in an inactive state to the SCSD administrator.

#### 4. ACTION TO BE TAKEN

Issue the OP:OOS input message to determine if the SCSD unit is listed as out-of-service. Otherwise, enter Recent Change And Verify (RC/V) to verify input message arguments.

If logical addressing is used, check that the logical group name exists and/or the point number is contained in the logical group. If physical addressing is used, verify that the SCSD unit is equipped.

If the results are negative, seek technical assistance.

- [7] PRM\_a b6de 7qr uss nnn ooo hi jk lm

## 2. REASON FOR OUTPUT

To report the completion status of each computer process during processor recovery. The report is called a Processor Recovery Message (PRM). See the *UNIX® RTR Operating System Processor Recovery Messages Guide* for detail on specific PRMs printed on the Read Only Printer (ROP).

Successful execution produces a success PRM. If a process encounters a failure, a failure PRM is produced to indicate which process failed, the reason for the failure, and, in some cases, the failing data.

Format 1 is printed for all processes except the disk driver.

Formats 2 - 7 are disk driver failure PRMs.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number of the Control Unit (CU) which output the PRM (0-1).
- b Type of PRM:
  - E — Success.
  - F — Failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Major step or process that output PRM:
- 0 — Microboot.
  - 1 — Little Boot and load disk from tape.
  - 2 — Processor Initialization (PINIT).
  - 3 — Big Boot.
  - 4 — Kernal Boot (KBOOT).
  - 5 — Error Interrupt Handler (EIH).
  - 6 — Disk Driver.
  - 7 — Input / Output Processor (IOP) Driver.
  - 8 — File Manager.
  - 9 — UNIX® RTR Processes: kernel, scheduler, memory manager, capabilities manager, or utilities manager.
  - A — Process Manager.
  - B — System Integrity Monitor (SIM).
  - C — SIM recovery complete.
  - D-E — Not used by UNIX® RTR. Could be an application process. See application documentation.
- d UNIX® RTR level of initialization.
- e Application level of initialization.
- f Two-digit code for function within major step.
- g 10 digits of failure data or other information.
- h Emergency Action Interface (EAI) status digit bits numbered right to left:
- 3 — Power up.
  - 2 — Central Control (CC) run.
  - 1 — CC active.
  - 0 — EAI All Seems Well (ASW).
- i EAI status digit, bits numbered right to left:
- 3 — New PRM.
  - 2 — Maintenance Reset Function (MRF) start.
  - 1 — Pulse point 23.
  - 0 — Pulse point 22.

SEE PROPRIETARY NOTICE ON COVER PAGE

- j                    EAI status digit, bits numbered right to left:
- 3 — IPB received.
  - 2 — EAI enabled.
  - 1 — Primary disk.
  - 0 — Secondary disk.
- k                    EAI status digit, bits numbered right to left:
- 3 — CC forced on.
  - 2 — CC forced off.
  - 1 — Timer disable.
  - 0 — CC MRF.
- l                    Current status of inhibits, bits numbered right to left:
- 3 — Hardware checks are inhibited.
  - 2 — UNIX® RTR error interrupts are inhibited.
  - 1 — Cache is bypassed (inhibited).
  - 0 — Software checks are inhibited (SIM inhibited).
- m                    Configuration control options, bits numbered right to left:
- 3 — Backup root file system being used.
  - 2 — Minimum configuration being used.
  - 1 — Unused.
  - 0 — Unused.

#### 4. ACTION TO BE TAKEN

Refer to the *Processor Recovery Message Guide* for detailed information. If additional information is required, contact the product engineering control center.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... PUMP:ATP  
WORK CENTER.. MOC  
GENERIC ..... 4AP13 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

- [1] PUMP:ATP COMPLETED FOR LNa b (c ms)
- [2] PUMP:ATP REQUEST DENIED BY LNa b
- [3] PUMP:ATP ABORTED BY LNa b
- [4] PUMP:ATP ABORTED BY 3B
- [5] PUMP:ATP FAILED AT LNa b
- [6] PUMP:ATP TIMED OUT WAITING FOR LNa b

## 2. REASON FOR OUTPUT

Format 1 indicates a successful pump of the node specified. Formats 2-6 indicate various errors.

Format 2 indicates that the node is not ready to be pumped due to a pump or node initialization already in progress.

Formats 3 and 4 indicate that a pump in progress had to be aborted due to a fatal error condition or preemption by recent change. Preemption by recent change will always result in a 3B initiated abort (format 4). Fatal errors may occur in the 3B or the node. On the 3B, fatal errors will be accompanied by a REPT:ATPCM PROC(Data\_base) message describing the error (failed disk read, database not initialized etc.)

The ATP node checks the administrative block of the database before applying it for use by call processing on the node. Format 5 indicates that the ATP node failed to apply the newly pumped database due invalid administrative data in the database.

Format 6 indicates that the node is not responding to pump messages from the 3B.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                               |
|---|-----------------------------------------------|
| a | ATP node group number(00-63)                  |
| b | ATP node member number(0-15)                  |
| c | Elapsed time during the pump in milliseconds. |

## 4. ACTION TO BE TAKEN

If the node is initializing a format 2 output may result. The best approach in this case is to wait a few seconds and retry.

SEE PROPRIETARY NOTICE ON COVER PAGE

Recent change has priority over PUMP:ATP when updating the database. A format 4 message may result if PUMP:ATP had to be aborted to allow a recent change to go through. For the recent change abort case, no REPT:ATPCM PROC(Data\_base) error message should appear. Seek technical assistance if such messages occur since they indicate fatal errors occurring during the pump.

Formats 3, 5, and 6 do not occur under normal circumstances; seek technical assistance if they appear.

## 2. REASON FOR OUTPUT

- [1] Message format is wrong, usually missing Keywords. Re-enter the message.
- [2] Retry Later. This is an internal error due to a failure in sending the delete request to the HOME DLN. and ERROR number will be printed to indicate where the failure happened
- [3] The format of the message is wrong, check the input message and retype the correct format. A string will be printed to indicate where the where is the failure.
- [4] The 3B successfully send the delete request to the DLN. The result of attempting to delete the entry from the database will be printed in ddd.

## 3. VARIABLE FIELD DEFINITIONS

aaaa DLNCM Failures:

- 15 — Failed to getport to DLNCM
- 16 — Failed to Find OUTBOUND DLN

Failure to OPEN IMS Channel:

- 1 — Can't open because msg switch is down
- 7 — Out of read queues to allocate
- 8 — Out of old write queues to allocate
- 103 — Maximum open channels
- 104 — Bad function name in the argument

SEE PROPRIETARY NOTICE ON COVER PAGE

-109 — Channel already open wait 2 minutes and retry

Failure to Set IMS Channel Controls:

- 3 — Not your channel.
- 6 — Out of read queues to allocate.
- 9 — No new message lists available.
- 17 — No block read lists available.
- 101 — Bad Channel number.
- 102 — Channel is closed.
- 106 — Could Not Make open request.

Failure to send Msg to DLN:

- 294 — Not enough space to satisfy the request.
- 299 — Can't open because msg switch is down.
- 247 — Chan number out of range.
- 198 — Channel is close.
- 199 — Bad Channel number.
- 296 — Bad length of the msg.

- 143 — Error on reading from the database.
- 144 — Error on writing to the database.
- 154 — Database inconsistencies have been detected.
- 155 — Cache inconsistencies have been detected.
- 156 — The ADMINTOC or DBTOC magic number is invalid.
- 157 — Invalid database type for this application.
- 160 — Clump number is out of range for application.
- 178 — Database inconsistencies have been detected.
- 179 — Invalid input parameters detected at DLN.
- 180 — The ANI was not found.
- 181 — Invalid database address detected.
- 182 — Invalid database pointer detected.
- 183 — Invalid database range detected.
- 186 — Delete failed.
- 187 — Invalid database pointer detected.
- 188 — Invalid request detected at DLN.
- 190 — The application database value is invalid.
- 192 — The specified access mode is invalid.
- 193 — The specified customer identification number is invalid.
- 194 — The compaction table search chain exceeded maximum length.
- 195 — The ANI table search chain exceeded maximum.
- 196 — The DLN user buffer address is invalid.
- 197 — Invalid table specified.

#### **4. ACTION TO BE TAKEN**

- [1] Check the format of the input message and enter the right format.
- [2] Wait few minutes, retry the message for a second time. If the problem persist, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

- [3] Message format is not good, check the data and the format of the input message and re-enter it.
- [4] The code returned in the message will reflect the result of the data services attempting to delete the entry from the table. No action is needed for codes 0, 105 since they reflect normal operation. Any other code MAY reflect a problem with the data base, seek technical assistance.

## 1. FORMAT

The following variations of the format describe the ways in which information can be represented in the output message.

For messages preceded by ?I (invalid) or RL (retry later) the output will be as follows:

**NOTE:** [ ]'s are not included in error message.

[1] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETE  
[ERROR MESSAGE]

where [ERROR MESSAGE] can be one of the following:

### USER ERRORS:

- (1) ?I - MESSAGE FORMAT = RC:MISC;FHT,FTA
- (2) ?I - INVALID FUNCTION AND TT TYPE
- (3) ?I - THIS OPTION IS NOT SUPPORTED - Use RC:GTT
- (4) RL - ANOTHER RC or VER IS ACTIVE
- (5) RL - INHIBIT ACTIVE

### PROGRAM ERRORS:

- (1) RL - CAN'T ATTACH CNIPAS

For messages produced by invalid user syntax the output will be as follows:

[2] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
[ERROR MESSAGE]

[11] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETE  
RC FOR ORDER bbbbbbbbbb REJECTED

where [ERROR MESSAGE] can be one of the following:

- (1) NG - MUST SUPPLY AN ORDER NUMBER
- (2) NG - ORDER NUMBER LONGER THAN 9
- (3) NG - FIRST 4 CHARS OF ORDER# MUST BE ALPHABETIC
- (4) NG - MISSING DATA: COMMAND
- (5) NG - INVALID COMMAND
- (6) NG - ERROR ON COMMAND SPECIFICATION
- (7) NG - MISSING DATA: PROCESSING FLAG
- (8) NG - INVALID PROCESSING FLAG
- (9) NG - MISSING KEYWORD NUM

SEE PROPRIETARY NOTICE ON COVER PAGE

- (10) NG - MISSING DATA: RC RELATION
- (11) NG - INVALID RC/VER RELATION
- (12) NG - MISSING DATA: PRIM SSN
- (13) NG - PRIM SSNPC CONTAINS LETTERS

- (59) NG - RECKEY MUST BE ZERO

SEE PROPRIETARY NOTICE ON COVER PAGE

- (60) NG - RELATION 4 NOT USED FOR DELETE
- (61) NG - TOO MANY RECKEYS: MAX OF 2 ALLOWED
- (62) NG - TOO MANY RECORD KEYS SPECIFIED

For messages produced by errors while performing database searching or database actions (add, delete, change) before any data has been written to the database, the output will be as follows:

- [3] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
[ERROR MESSAGE]
- [4] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
ERR xxx yyy RECKEY cccccccccc
- [5] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETE  
RC FOR ORDER bbbbbbbbbb COMPLETE - DLN UNCHANGED

where [ERROR MESSAGE] can be one of the following:

USER ERRORS:

- (1) NG - ANIs EXIST IN THIS RANGE
- (2) NG - RANGE INVALID WHEN STARTED WITH LIST
- (3) NG - USER DATA DOES NOT REFLECT CHANGE
- (4) NG - NO CUST DATA FOUND
- (5) NG - NO NCP DATA FOUND
- (6) NG - CANNOT SPLIT RANGE ON CHANGE
- (7) NG - ANI DATA PREVIOUSLY EXISTS
- (8) NG - NO ANI DATA FOUND
- (9) NG - NO AVAILABLE NCP ENTRIES
- (10) NG - CUST DATA PREVIOUSLY EXISTS
- (11) NG - DATA PREVIOUSLY EXISTS
- (12) NG - ERROR ALLOCATING RECORD ENTRY
- (13) NG - NO ANI DATA FOUND
- (14) NG - NO AVAILABLE NCP ENTRIES
- (15) NG - NO NCP DATA FOUND
- (16) NG - OLD DATA DOES NOT MATCH

PROGRAM ERRORS:

- (1) DB - ERROR ACCESSING DATA TABLE
- (2) DB - ERROR ALLOCATING HEAD TABLE
- (3) DB - ERROR POPULATING DLN UPD ARRAY
- (4) DB - ERROR LSEEKING TO BINK ZERO
- (5) DB - ERROR READING BINK ZERO
- (6) DB - ERROR LSEEKING TO DATA TABLE
- (7) DB - ERROR ALLOCATING HEAD TABLE
- (8) DB - ERROR DEALLOCATING DATA TABLE
- (9) DB - ERROR WRITING BINK ZERO
- (10) DB - ERROR OPENING DATABASE
- (11) DB - ERROR CLOSING DATABASE
- (12) DB - ERROR WRITING DATA TABLE

SEE PROPRIETARY NOTICE ON COVER PAGE

- (13) DB - ERROR SORTING DATA TABLE
- (14) DB - INVALID ANI TABLE POINTER
- (15) DB - ERROR SENDING RC MESSAGE TO ARTS
- (16) DB - ERROR GETTING ARTS PORT
- (17) DB - ERROR CREATING ROLLBACK FILE
- (18) DB - ERROR ALLOCATING RC STRUCTURE
- (19) DB - RC:MISC;FHT,FTA VERSION ERROR
- (20) DB - ERROR FORMATTING INTERNAL CMD
- (21) DB - ERROR CONNECTING TO RCV PROCESS
- (22) DB - ERROR WRITING TO RCV PROCESS
- (23) DB - ERROR READING RCV PROCESS
- (24) DB - ERROR DECODING INTERNAL RESPONSE

For messages produced by errors while performing database adding, deleting, or changing after data has been written to the database, the output will be as follows:

- [3] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
[ERROR MESSAGE]
- [6] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
ROLLING BACK DATABASE
- [7] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
ORDER HAS BEEN ROLLED BACK
- [4] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
ERR xxx yyy RECKEY cccccccccc
- [5] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETE  
DLN ERROR CODE = X'dddddddd

For messages produced by errors while performing database adding, deleting, or changing after data has been written to the database and the rollback function was not successful, the output will be as follows:

- [3] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
[ERROR MESSAGE]
- [6] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
ROLLING BACK DATABASE
- [8] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
[ERROR MESSAGE1]
- [9] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
DB-AUTOMATIC ROLLBACK FAILED
- [4] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
ERR xxx yyy RECKEY cccccccccc

SEE PROPRIETARY NOTICE ON COVER PAGE

[5] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETE  
DLN ERROR CODE = X'dddddddd

and where [ERROR MESSAGE1] can be one of the following:

PROGRAM ERRORS:

- (1) DB - ERROR UNLOCKING DATABASE
- (2) DB - ERROR OPENING ROLLBACK FILE
- (3) DB - ERROR CLOSING ROLLBACK FILE
- (4) DB - ROLLBACK FILE DOES NOT EXIST
- (5) DB - ERROR READING DATABASE
- (6) DB - ERROR WRITING DATABASE
- (7) DB - ERROR LSEEKING DATABASE

On a successful recent change the following output will be produced:

[10] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETE  
RC FOR ORDER bbbbbbbbbb COMPLETE UPD CODE = X'dddddddd

On a successful recent change, but the DLN is not updated, the following output will be produced:

[5] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
DLN ERROR CODE = X'dddddddd

On a successful recent change, but catastrophic (i.e., a recent change causing all DLNs to be removed from service) errors resulted during DLN update, the following output will be produced for a four DLN office:

[12] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
DLN ERROR CODE = X'44444444

or, for a two DLN office:

[12] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb IN PROGRESS  
DLN ERROR CODE = X'44440707

In either case, the recent change causing this error message will be backed out (via rollback) and the "DLN Inhibit" trigger will be activated. This trigger will disallow any RCV activity (except VERIFYs) to the database until manual action (see ALW:RCV-APPDB) is taken to correct the trouble. The entire RC:MISC-FHT-FTA message will be echoed to the ROP.

For messages produced by errors while transferring RC requests from the switch I/O handlers to the RCV process handling RC requests, the output will be as follows:

[13] M S RC MISC FHT FTA GTT10Daaa bbbbbbbbbb COMPLETED  
RC FOR ORDER bbbbbbbbbb ERROR sss (ttt)

SEE PROPRIETARY NOTICE ON COVER PAGE

## 2. REASON FOR OUTPUT

To request the user to add, delete, verify, or change all record keys that are specified in the input message.

To verify the correctness of a message, acknowledge receipt of a message, to communicate with the user technician, and to perform the database routine specified in the message.

## 3. VARIABLE FIELD DEFINITIONS

|            |                                                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| aaa        | Translation type: may have a value of 253 for 800 and 900 services, or 242 for PCPGTT. (aaa may also have APN appended if this was specified on the input message.) |
| bbbbbbbbbb | Order number: the first four characters signify where the RC originated; the last five characters signify a unique number for the recent change.                    |
| cccccccccc | Record key: indicates which record in the list or range was in error.                                                                                               |
| dddddddd   | 32-bit update code for DLNs which represents errors or success for 4 DLNs.                                                                                          |

Each byte is a positive 7-bit update return code:

- 0 — SUCCESS.
- 1 — appdb pump in progress.
- 2 — aci pump in progress.
- 3 — aci update in progress.
- 4 — dln is OOS.
- 5 — no TCB resources for child task.
- 6 — appdb update timeout (> 15 seconds).
- 7 — dln is UNEQUIPPED.
- 10 — Udlnappdb() failed to open the database.
- 30 — \_updappdb() # elements out of range.
- 31 — \_updappdb() dlnid out of range.
- 32 — \_updappdb() failed to send dln update start command.
- 33 — \_updappdb() bad dln response to update start command.
- 34 — \_updappdb() unable to Lseek() to appdb changed area.
- 35 — \_updappdb() unable to Read() to appdb changed area.
- 36 — \_updappdb() failed to send dln read start command.
- 37 — \_updappdb() bad dln response to read start command.
- 38 — \_updappdb() failed to send dln update complete command.
- 39 — \_updappdb() bad dln response to update complete command.

|     |                                                                 |
|-----|-----------------------------------------------------------------|
| sss | Error number. See Minor Error Codes at the end of this message. |
| S   | Number of seconds in current minute.                            |
| ttt | Error number. See Major Error Codes at the end of this message. |
| xxx | Error number. See Error Codes at the end of this message.       |

CHANGING  
DELETING

#### 4. ACTION TO BE TAKEN

Format 1: These are responses that are out of the user's control. The user should retry the message.

Format 2: These are normal responses to format errors of the RC:MISC-FHT-FTA input message. The user should check the message typed on the screen against rules given in the input document message.

Formats 3, 6, 7, 8, and 9: These are error responses encountered from programs that are initiated by the recent change message. The user should check the correctness of the data entered in the message and the error code returned.

Format 4: Error message with a code indicating recent change error.

Format 5: Complete message on a failure.

Format 10: Represents success. No action taken.

Format 12: There was a problem with the DLNs.

# Error Codes for GTT Data Applications

## Major Error Codes

| Errno | Definition                                  |
|-------|---------------------------------------------|
| 4     | Input parameter error                       |
| 8     | Improper SKO action requested               |
| 10    | Record found                                |
| 11    | Record not found                            |
| 14    | Internal error failure                      |
| 17    | Database locked -- by manual action         |
| 23    | Database locked - "DLN Inhibit" lock is set |
| 24    | Database locked -- already in use           |
| 25    | SKO backed out                              |
| 26    | Backout failed for SKO                      |
| 27    | Improper key                                |
| 29    | Data error                                  |
| 31    | Improper database specified                 |

## Minor Error Codes

| Errno | Definition                                                                                                                                      |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 101   | Database service did not complete successfully.                                                                                                 |
| 105   | Item to be modified was not located.                                                                                                            |
| 110   | The 10-digit dialed number / ANI could not be added to the database because the hash table was full.                                            |
| 111   | A 10-digit dialed number / ANI could not be added to the database because the 10-digit compaction table was full.                               |
| 112   | The EPAV table is full.                                                                                                                         |
| 116   | The point code sub-system information associated with the dialed digit / ANI could not be added to the database because the NCP table was full. |
| 120   | An object could not be added to the database because it already existed.                                                                        |
| 123   | The dialed digit / ANI being searched for was not found.                                                                                        |
| 124   | The specified NPA-NXX combination was not found.                                                                                                |

SEE PROPRIETARY NOTICE ON COVER PAGE

Error Codes for GTT Data Applications (continued)

Minor Error Codes

| Errno | Definition                                                                                      |
|-------|-------------------------------------------------------------------------------------------------|
| 127   | The point code sub-system information associated with the dialed digit / ANI does not exist.    |
| 130   | The customer's EPAV chain length has reached maximum length.                                    |
| 132   | The EPAV customer's ANI record does not exist.                                                  |
| 133   | The EPAV customer has no EPAVs / subaccounts.                                                   |
| 134   | The EPAV-ANI exists, but the associated subaccount does not exist.                              |
| 135   | Neither the EPAV-ANI nor the associated subaccount exists.                                      |
| 141   | File descriptor invalid.                                                                        |
| 143   | An error occurred during an attempted database read.                                            |
| 144   | An error occurred during an attempted database write.                                           |
| 154   | Database inconsistencies have been detected.                                                    |
| 155   | Cached inconsistencies have been detected.                                                      |
| 156   | The ADMINTOC or DBTOC magic number in the specified database is invalid.                        |
| 157   | Invalid database type for this customer.                                                        |
| 160   | Clump number is out of range for specified customer.                                            |
| 176   | All file descriptors are active, none available for assignment.                                 |
| 180   | The NPA-NXX value that is to replace an existing value already exists in the database.          |
| 189   | The number of subaccount digits to match on in request does not match stored digit count value. |
| 190   | The specified customer unit is invalid.                                                         |
| 191   | The specified user identification number is invalid.                                            |
| 192   | The specified access mode was something other than read_only or read_write.                     |
| 193   | The specified customer identification number is invalid.                                        |

TYPE ..... Output

## 1. FORMAT

- [1] RC ORNU a ACTIVATED
- [2] RC ORNU a FAILED ACTIVATION  
FAILURE b, ADDRESS c  
ERROR MESSAGE

## 2. REASON FOR OUTPUT

Prints in response to the RC:PCP-CHG input message.

## 3. VARIABLE FIELD DEFINITIONS

- a Order number in RC message.
- b Error message:
- 3 — Technical assistance required. General error, "catch all" for internal errors like "disk I/O error".
  - 23 — Translator is full. Indicates a common shared resource has been depleted.
  - 1000 — Bad RC:PCP header, must be RC:PCP;CHG;OPT(SAB),ACT:.
  - 1001 — Missing or invalid CANI keyword or argument.
  - 1002 — Missing or invalid TOA keyword or argument.
  - 1003 — Missing or invalid TSVC keyword or argument.
  - 1004 — Missing or invalid NUMPL keyword or argument.
  - 1005 — Missing or invalid ORNU keyword or argument.
  - 1006 — Missing or invalid action keyword or argument.
  - 1007 — Missing or invalid PAV keyword or argument.
  - 1008 — EPAV limit of 20 values per RC command.
  - 1467 — All preassigned values must be of the same length.
  - 1468 — Total number of preassigned values may not exceed 200. RC being processed will make the customer's EPAV list exceed length of 200.
  - 1709 — Customer entry is not assigned.

FORK FAILED — MENU finds system call failure.

INTERNAL ERROR — Recent change activity encountered an internal error; error message logged to error file named for the activity.

ODIN FORM CHECK FAILED FOR BATCH — Special error return from RCV3B to indicate a failure in batch mode.

OUT OF MEMORY — MENU cannot find main memory for setup.

PIPE FAILED — System call failed.

READ FAILED — System call failed.

SETTRAP STDIN FAILED — System call failed.

WRITE FAILED — System call failed.

d Error number after system call failure. See System Error Codes Output Appendix, APP:SYSERR.

#### 4. ACTION TO BE TAKEN

Check the input messages and the output messages version of the message to see if an error log file exists.

If INTERNAL ERROR is printed, examine the error log file. If an error log file does not exist, check the Read Only Printer (ROP).

Seek assistance to restore the system to sanity if any other system-related or library-related message is printed.

Refer to input message document and reenter the correct input format for any other error messages.

ID ..... RCVRY:DUI  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

RCVRY DUI a b [c]

## 2. REASON FOR OUTPUT

To report the outcome of a Direct User Interface (DUI) subdevice recovery attempt. The DUI, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Termination status:
- ABORTED — An error occurred: recovery failed.  
COMPLETED — Recovery was successful.
- c Additional error information. (See Output Appendix APP: IOP-F.)

## 4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit.

## 1. FORMAT

RCVRY EAI a b [c]

## 2. REASON FOR OUTPUT

To report the outcome of an Emergency Action Interface (EAI) circuit pack recovery attempt. The EAI, initially in the active state, transitions to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Member number.
- b                      Termination status:
- ABORTED    — An error occurred: recovery failed.  
                        COMPLETED — Recovery was successful.
- c                      Additional error information. (See Output Appendix APP: IOP-F.)

## 4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit. Before running diagnostics on the EAI, clear it using the CLR:EAI command on the Emergency Action Page. Phases 61 and 93 of the DGN:CU a, CC command are EAI diagnostics.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

RCVRY MTC a b [c]

## 2. REASON FOR OUTPUT

To report the outcome of a Magnetic Tape Controller (MTC) recovery attempt. The MTC, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful, or the unit is removed from service because of a high error count.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Member number.
- b                      Termination status:
- ABORTED    — An error occurred: recovery failed.
- COMPLETED — Recovery was successful.
- c                      Additional error information. (See Output Appendix APP: IOP-F.)

## 4. ACTION TO BE TAKEN

If the unit is ultimately removed from service because of a high error count, run diagnostics and repair the unit.

## 5. REFERENCES

## 2. REASON FOR OUTPUT

These message formats are used to identify the results of an audit error being detected by the Remote Access Subsystem (REMACS) software between replicated data in the 3B20D/3B21D data memory and the data memory in the nodes on the Interprocess Message Switch (IMS) ring. Normally, the REMACS audits will run continually because of the criticality of the data involved.

The purpose of these printouts is to aid the software designers in identifying and correcting any software errors involving the data being audited.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 1 is used to identify that an audit error has been detected between 3B20D/3B21D data and the same replicated data in one or more nodes on the IMS ring. Normally, only the first node that responds with the audit error will have its faulty data displayed on the printout. After detecting the audit error, the REMACS software will broadcast correction data to the node(s) to get the 3B20D/3B21D and node data back into conformance. It is always assumed that the 3B20D/3B21D data is the correct data while the audit is running.

Format 2 is used to summarize the results of the previous audit cycle in which an audit error was detected. Only as much information as needed is printed out on this summary to give the results of the audit. If no audit errors are detected, messages of this type will not occur.

**NOTE:** These formats represent the fullest expansion of the printouts that can occur. Some fields may not print out under certain circumstances which are described in the Variable Field Definitions.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                                                                                                                                                                                                                                                                       |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | The hexadecimal ring node address of a node on the IMS ring which reported an audit error.                                                                                                                                                                                                                                                                                                            |
| b | The hexadecimal window number in which an audit error was detected. REMACS uses window numbers to identify unique sets of data (i.e. tables) that are to be audited. It is necessary to contact technical personnel in order to identify the affected data.                                                                                                                                           |
| c | A hexadecimal address which is relative to the start of the data window. It represents a start point for a chunk of data to be audited. The relative to the start of the data window address will be on the next line will be within the range of the chunk of data being audited.                                                                                                                    |
| d | A hexadecimal address that is relative to the start of the data window.                                                                                                                                                                                                                                                                                                                               |
| e | Up to 16 bytes of hexadecimal data may be displayed on each line and it represents actual data contents of 3B20D/3B21D data or node data at the time the audit error was detected. One must compare the differences between the 3B20D/3B21D data image and the node data image in order to find the byte(s) in error. It is always expected that the 3B20D/3B21D data is the correct data to be used. |
| f | Identifies the specific node ring node addresses for nodes that reported an audit error to the REMACS software.                                                                                                                                                                                                                                                                                       |
| g | If greater than 10 nodes are identified, this field gives a count of those nodes exceeding 10.                                                                                                                                                                                                                                                                                                        |
| h | A count of audit errors that were detected by the REMACS software, but could not be stored in the audit error buffers because of a lack of resources. The OTHER ERRORS line will not print out if there are sufficient audit error buffers to contain the detected audit errors.                                                                                                                      |
| i | In conjunction with the error count field, this field will identify the number of nodes that have reported audit errors while the audit error buffers are congested.                                                                                                                                                                                                                                  |

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

The REMACS audit software is designed to automatically correct the data inconsistency between the 3B20D/3B21D memory and the memory of the affected nodes on the IMS ring, therefore no further action is required. Since the cause of these printouts is most likely a software problem in the 3B20D/3B21D or the nodes, it is recommended that the information in the printouts be collected and the customer support personnel be notified.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:3BN-DMA  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

- [1] REPT 3BN DMA RSTRT  
UNEXPECTED ERR DURING DLN DMA RESTART ON a b, STATE = c
- [2] REPT 3BN DMA RSTRT  
a b RESTART DMA TIMEOUT

## 2. REASON FOR OUTPUT

Format 1 is printed when a hardware command fails in the sequence of DMA restart on the specified node.

Format 2 is printed when the sequence of restart DMA on the specified node times out.

**NOTE:** A 3B node is defined to be a node that is not an RPC and yet connected directly to the 3B.

## 3. VARIABLE FIELD DEFINITIONS

- a The 3B Node name (e.g., DLN) and group number (00-63).
- b The 3B Node member number (1-15).
- c The reason for the complaint:
- 1 — Attach interrupt failure.
  - 2 — Clear ddsbs failure.
  - 3 — Cannot send reset 3BI pio.
  - 4 — Fail to program the DMAC to the user's area.
  - 5 — Cannot enable interrupt.
  - 6 — Cannot send NP level 1 restart pio.

## 4. ACTION TO BE TAKEN

Use normal maintenance procedures; diagnose the 3B node. If ATP, contact IMS technical personnel and restore the node to service.

**NOTE:** Unless inhibited, the Automatic Ring Recovery (ARR) routine will attempt (up to 3 times) automatic recovery of Out Of Service (OOS) 3B nodes, if the node maintenance state is not marked MANUAL.

## 1. FORMAT

This message has 11 formats.

- [1] REPT ADB STOPPED IBGTT DATABASE REPORTED AUDIT ERROR
- [2] REPT ADB STOPPED DLN INHIBIT ACTIVE
- [3] REPT ADB STOPPED WAITED ONE HOUR FOR DATABASE
- [4] REPT ADB STOPPED NOT ALLOWED
- [5] REPT ADB STOPPED COULD NOT INH RCV
- [6] REPT ADB STOPPED INH RCV ALREADY ACTIVE
- [7] REPT ADB STOPPED DLNAUD IS ALREADY INHIBITED
- [8] REPT ADB STOPPED COULD NOT INH DLNAUD
- [9] REPT ADB STOPPED COULD NOT COPY THE DATABASE
- [10] REPT ADB STOPPED COULD NOT ALW DLNAUD
- [11] REPT ADB STOPPED COULD NOT ALW RCV

## 2. REASON FOR OUTPUT

Response to the ADB CRON job.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

Format 1: The database will not be backed up when APPDB Audits is finding errors.

Format 2: The database will not be backed up when the DLN Inhibit is active.

Format 3: The database was in use for an hour, i.e., a user was making a copy.

Format 4: The ADB is inhibited; see ALW:ADB input command to allow ADB.

Format 5: The ADB process could not INH:RCV; try again ADB (see START:ADB).

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6: If the ADB process is to run, then RCV needs to be allowed.

Format 7: If the ADB process is to run, then DLNAUD needs to be allowed.

Format 8: The ADB process could not INH:DLNAUD; try rerunning ADB (see START:ADB).

Format 9: The ADB process could not COPY:APPDB; try rerunning ADB (see START:ADB).

Format 10: The ADB process could not INH:DLNAUD; run ALW:DLNAUD (with IBGTT AUD ALL option).

Format 11: The ADB process could not INH:RCV; run ALW:RCV;APPDB (with the IBGTT option).

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT ADP AUTORST FAILURE FOR a b [c] [d]
- [2] REPT ADP MAJOR ALARM AUTORST FAILURE FOR a b [c] [d]
- [3] REPT ADP MINOR ALARM AUTORST FAILURE FOR a b [c] [d]
- [4] REPT ADP NO AUTORST, UNIT IS MAN RMV FOR a b [c] [d]
- [5] REPT ADP NO AUTORST, UNIT IS FLT RMV FOR a b [c] [d]
- [6] REPT ADP NO AUTORST, UNIT IS NOT OOS FOR a b [c] [d]

## 2. REASON FOR OUTPUT

The Automatic Diagnostic Process (ADP) after fault branch was unable to restore a suspected faulty hardware unit, and ADP will no longer attempt to diagnose or restore the hardware unit or community.

Format 1 is output to report that the suspected faulty hardware unit or community has exceeded its error threshold.

Format 2 is output when the hardware unit or community is essential.

Format 3 is output when the hardware unit or community is a unit or community whose top unit is an Input/Output Processor (IOP).

Format 4 is output to report that the unit will not be automatically restored because it was manually removed.

Format 5 is output to report that the unit will not be automatically restored because it was fault removed.

Format 6 is output to report that the unit will not be automatically restored because it was not out of service.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name.
- b Unit number.
- c Subunit name.

SEE PROPRIETARY NOTICE ON COVER PAGE

d Subunit number.

#### 4. ACTION TO BE TAKEN

For Format 1, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For Formats 2 and 3, if the hardware unit or community failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

The Maintenance Input Request Administrator (MIRA) process might not start or complete ADP's restore requests for one of the reasons (use the OP:DMQ input message to check the Deferred Maintenance Queue [DMQ]):

- The DMQ already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.
- Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the ALW:DMQ input message to remove the inhibit.
- An initialization interval is in the progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.
- ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

For Format 4, if the hardware unit should be restored, then restore the unit manually.

For Format 5, if the hardware unit should be restored, determine what is wrong with the unit using diagnostics, correct the problem, and manually restore the unit.

For Format 6, if the hardware unit is not active and not Out Of Service (OOS), and if the hardware unit should be restored, then move the unit to OOS using Recent Change And Verify (RC/V) Unit Control Block (UCB) and manually restore the unit.

ID ..... REPT:ADP-AUTHRESH  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT ADP AUTORST THRESHOLD EXCEEDED FOR a b [c] [d]

## 2. REASON FOR OUTPUT

To report that the specified faulty hardware unit or community of units has exceeded its error threshold. The Automatic Diagnostic Process (ADP) will no longer attempt to diagnose or restore the unit or community of units. The maximum number of restorations allowed is found in the max\_restorable field in the ucbdyn form in the Equipment Configuration Database (ECD).

**NOTE:** The ucbdyn form is a review-only form.

## 3. VARIABLE FIELD DEFINITIONS

|   |                 |
|---|-----------------|
| a | Unit name.      |
| b | Unit number.    |
| c | Subunit name.   |
| d | Subunit number. |

## 4. ACTION TO BE TAKEN

Manual diagnosis and restoration of the unit is required. This can be accomplished by using the RST input command for a restoration on a specified unit with or without running diagnostics. The DGN input command will run diagnostics on the specified unit with no restoration.

## 1. FORMAT

REPT ADP INTERFACE ERROR a [b][c][d][e]

## 2. REASON FOR OUTPUT

To report that the Automatic Diagnostic Process (ADP) has encountered a problem interfacing with another part of the UNIX® RTR system while attempting to restore a hardware unit or community of units.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Error codes:
- 1 — ADP could not open the Equipment Configuration Database (ECD).
  - 2 — ADP could not obtain a Unit Control Block (UCB).
  - 3 — ADP could not set a value in a UCB.
  - 4 — ADP could not enable messages.
  - 5 — ADP could not send a message to the port that is assigned to the Maintenance Input Request Administrator (MIRA).
  - 6 — MIRA could not execute a request that was sent to it by ADP.
  - 7 — ADP could not retrieve an Input/Output Peripheral Controller (IOPC) UCB.
- b                      Unit name.
- c                      Unit number.
- d                      Subunit name.
- e                      Subunit number.

## 4. ACTION TO BE TAKEN

For error code 6, use the OP:DMQ input message to determine the status of the MIRA process. If automatic diagnostics are inhibited in MIRA, the ALW:DMQ input message may be used to remove the inhibit. If the problem persists, obtain technical assistance.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT ADPAB MAJOR ALARM RESTORE FAILURE  
FOR a b [c] [d]
- [2] REPT ADPAB MINOR ALARM RESTORE FAILURE  
FOR a b [c] [d]
- [3] REPT ADPAB - COMMAND LINE ERROR

## 2. REASON FOR OUTPUT

The Automatic Diagnostic Process (ADP) After Boot (AB) branch was unable to restore a hardware unit left Out Of Service (OOS) after a bootstrap. ADPAB will no longer attempt to diagnose or restore the hardware unit or community.

Format 1 is output when the hardware unit or community is essential.

Format 2 is output when the hardware unit or community is a unit or community whose top unit is an Input/ Output Processor (IOP).

Format 3 is output when there is an error with the wait time option is used to invoke adp.ab. The -w option is used when the application wants to extend the wait time before restoring the units after an initialization without extending the initialization interval. If an other option is used then an error will occur. The range of the wait time is between 0 and 3600 seconds. If the option is under 0 seconds, the wait time will be set to 0 and this message will be output. If the option is over 3600 seconds, then the wait time will be set to 3600 seconds and this message will be output.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit name.
- b Unit number.
- c Subunit name.
- d Subunit number.

## 4. ACTION TO BE TAKEN

If the hardware unit or community actually failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

SEE PROPRIETARY NOTICE ON COVER PAGE

The Maintenance Input Request Administrator (MIRA) process might not start or complete ADPAB's restore requests for one of the reasons (use the OP:DMQ input message to check the Deferred Maintenance Queue [DMQ]):

- The DMQ already has a restore request for the hardware unit, community, or top unit. MIRA canceled ADP's restore request as a duplicate.
- Request source ADP is inhibited in the DMQ. Determine why ADP was inhibited and, if practical, use the ALW:DMQ input message to remove the inhibit.
- An initialization interval is in the progress. MIRA aborted tasks in the active queue. Tasks in the waiting queue are started at the end of the initialization interval. ADP may generate another restore request.
- ADP's internal request timer may have expired if there is a large number of manual requests and/or there is a high system load. ADP's request might still be in the DMQ. MIRA defers ADP requests in favor of manual requests, and part of the active queue is for manual requests only.

Request a restore on the hardware unit or community if the hardware unit, community, or top unit does not have a restore request in the queue. No further action is required if the restore is successful.

For Format 3 examine the User Level Automatic Restart Process (ULARP) record in the Equipment Configuration Database (ECD) that is used to create ADP and correct the command line. If the -w option is used then it must include a value in the range of 0 to 3600.

## 2. REASON FOR OUTPUT

To dump the contents of the DMERT interrupt stack when either a kernel level lockout occurs or a DMERT application process (DAP) created by Application Integrity Monitor (AIM) does not get its required entries. The kernel level lockout can be identified by a SIMCHK identifying kernel level lockout or an AIM phase (panic code 0x28) when kernel level lockout is not cleared in an appropriate amount of time. DAP monitoring failing can be identified by an AIM phase (panic code 0x22).

This message will also be sent to the APLOG log file.

## 3. VARIABLE FIELD DEFINITIONS

- a      Event number. This is a number between 0x01 and 0xff uniquely identifying a stack dump member.
- b      Stack dump progress:
  - STARTED      — Stack dump started for stack back trace.
  - IN PROGRESS — Stack dump in progress for stack back trace.
  - COMPLETED — Stack dump completed for stack back trace.
- c      Active CU at time of event.
- d      Time of error.
- e      Program Address for process at time of event.
- f      Program status word (PSW) for process at time of event. See 3B20D DMERT Error Messages Users Guide (PA-4C004-01) for layout of PSW.

## 1. FORMAT

- [1] REPT AIM ACTION TASK a X'c ACTIVATED
- [2] REPT AIM ACTION TASK a X'c COMPLETED RC=b

## 2. REASON FOR OUTPUT

Format 1 indicates that an internal AIM action has been activated. This may be output after a manually input EXC:AIM;ACTION command has been executed, or it may be output after the action is run internally by AIM for recovery purposes. A list of available actions is given in the Table.

Format 2 indicates that an internal AIM action has completed.

## 3. VARIABLE FIELD DEFINITIONS

- a Action name (see Table).
- c Internal AIM action code.
- b Return code from task operation:
- FAILURE
- IN PROGRESS
- RETRY LATER
- SUCCESS

## 4. ACTION TO BE TAKEN

Normally no manual action needed. If Format 2 returns FAILURE, seek technical assistance.

TABLE 1  
AIM ACTION DEFINITIONS

| Action  | Action Definition                                       |
|---------|---------------------------------------------------------|
| init0   | AIM runs this action on UNIX® RTR Phase 50.             |
| init1   | AIM runs this action on UNIX® RTR Phase 51.             |
| init2   | AIM runs this action on UNIX® RTR Phase 52.             |
| init3   | AIM runs this action on UNIX® RTR Phase 53.             |
| init4   | AIM runs this action on UNIX® RTR Phase 54.             |
| minboot | Starts APDRV, CNI/IMS.                                  |
| phase0  | Execute UNIX® RTR Phase 50.                             |
| phase1  | Execute UNIX® RTR Phase 51.                             |
| phase2  | Execute UNIX® RTR Phase 52.                             |
| phase3  | Execute UNIX® RTR Phase 53.                             |
| stopaim | Stop AIM utility processes.                             |
| stopnsc | Stop Network Services Complex processes.                |
| stopnm  | Stop Nemos processes.                                   |
| stopcft | Stop craft processes.                                   |
| zampas  | Zero AMA PAS segments.                                  |
| zapama  | Stop AMA processes, zero AMA PAS, and restart AMA.      |
| stopama | Stop AMA processes.                                     |
| runaim  | Run AIM utility processes.                              |
| runnsc  | Run Network Services Complex processes.                 |
| runnm   | Run Nemos processes.                                    |
| runcft  | Run craft processes.                                    |
| runama  | Run AMA processes.                                      |
| boot    | Common task run by all bootstrap levels.                |
| trace   | Execute an interrupt stack dump to PAS.                 |
| pdboot  | Enable PANIC DUMP and have it phase system.             |
| pdenabl | Enable PANIC DUMP for next phase (but no phase called). |
| rstama  | Restart AMA processes.                                  |
| rstnsc  | Restart Network Services Complex processes.             |
| rstnm   | Restart Nemos processes.                                |
| rstunix | Kill off all UNIX® processes (system-wide).             |
| rstaim  | Restart AIM utility processes.                          |
| rstcft  | Restart craft processes.                                |

## 1. FORMAT

- [1] REPT AIM EVENT a X'b TRIGGERED BY TASK X'c ON LINE d
- [2] REPT AIM EVENT a X'b ESCALATING BY TIMEOUT
- [3] REPT AIM EVENT a X'b CLEARED

## 2. REASON FOR OUTPUT

Format 1 indicates that an internal AIM event has been triggered. See Table for a list of valid event names.

Format 2 indicates that an internal AIM event has escalated to the next higher severity because it has timed out. See Table.

Format 3 indicates that an internal AIM event has been cleared. See Table.

## 3. VARIABLE FIELD DEFINITIONS

- a Event name (see Table).
- b Internal AIM event code.
- c AIM task ID.
- d Line number.

## 4. ACTION TO BE TAKEN

Action to be taken depends on how critical the event is. Seek technical assistance for Formats 1 and 2. No action needed for Format 3.

## 1. FORMAT

- [1] REPT AIM PROC TASK a X'b ACTIVATED
- [2] REPT AIM PROC TASK a X'b COMPLETED RC = c
- [3] REPT AIM PROCESS TASK a X'b AUDIT FAILURE

## 2. REASON FOR OUTPUT

Format 1 indicates that an AIM child process has been told to either initialize or terminate. This is only printed after a manual request to either initialize or terminate a process, so the craft response message will indicate which operation is to be performed (see Table).

Format 2 indicates that an AIM child process has completed either an initialization or termination operation.

Format 3 indicates a process that AIM thought was alive was found to be dead. The process is put back into a restart state. See Table for a list of valid process names.

## 3. VARIABLE FIELD DEFINITIONS

- a Process name (see Table).
- b Internal AIM process code.
- c Return code from task operation:
  - FAILURE
  - IN PROGRESS
  - RETRY LATER
  - SUCCESS

## 4. ACTION TO BE TAKEN

No action needed for Format 1.

If Format 2 returns FAILURE or if Format 3 appears, see technical assistance.

- [13] REPT AIM AMA FORMATTER NOT ACTIVE

## 2. REASON FOR OUTPUT

Format 1 indicates a process that AIM thought was alive was found to be dead. The process is put back into a restart state. See Table 3 for a list of valid process names.

Format 2 indicates that an internal AIM event has been triggered. See Table 1 for a list of valid event names.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 indicates that an internal AIM event has escalated to the next higher severity because it has timed out. See Table 1.

Format 4 indicates that an internal AIM event has been cleared. See Table 1.

Format 5 indicates that an internal AIM action has been activated. This may be output after a manually input `EXC:AIM;ACTION` command has been executed or it may be output after the action is run internally by AIM for recovery purposes. A list of available actions is given in Table 2.

Format 6 indicates that an AIM child process has been told to either initialize or terminate. This is only printed after a manual request to either initialize or terminate a process, so the user response message will indicate which operation is to be performed. See Table 3.

Format 7 indicates that an internal AIM action has completed.

Format 8 indicates that an AIM child process has completed either an initialization or termination operation.

Format 9 indicates that AIM has received an unknown fault code. If AIM receives 5 such faults in a 32-second interval, a phase will occur.

Format 10 indicates that AIM has written a line into the PMLOG, so that field support can follow up on, when a boot occurred; g stands for level of the boot, and h indicate time.

Format 11 indicates that AIM has written a line into the PMLOG, so that field support can follow up on, when a boot occurred; g stands for level 4 boot, and h indicate time. RTR down time is unknown because of the level 4 boot.

Format 12 indicates that AIM has written a line into the PMLOG, so that field support can follow up on, when a boot occurred; h stands for down time.

Format 13 indicates that AMA formatter is not active. This is output only when the application parameter 42-N-50 is entered on the MCRT.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                      |
|---|--------------------------------------------------------------------------------------|
| b | Event name (see Table 1).                                                            |
| c | Action name (see Table 2).                                                           |
| a | Process name (see Table 3).                                                          |

ID ..... REPT:AIMCHK-FS  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

REPT AIMCHK - FILE SYSTEM OVERFLOW a: [(LOWER CASE)] b

## 2. REASON FOR OUTPUT

To report that a DMERT file system is full or nearly full.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Severity of overflow condition:
- CRITICAL — File system is completely full.  
                        WARNING — File system is in danger of overflowing, possibly  
                                         within two hours.
- b                      File system name.

## 4. ACTION TO BE TAKEN

Manual action may be required to remove data from the file system named. In order to remove data safely, the craft must know which files in the file system are permanent and which are temporary. Refer to the application's specific document for file system maintenance and trouble-clearing procedures.

TYPE ..... Output

### 1. FORMAT

- [1] REPT AIMCHK a NON-HANDLED OVERLOAD X'b
- [2] REPT AIMCHK STRAY FAULT X'c

### 2. REASON FOR OUTPUT

To report an Application Integrity Monitor (AIM) fault condition. Format 1 reports an overload status change fault from the System Integrity Monitor (SIM) not handled by AIM. Format 2 reports an invalid fault received by AIM.

### 3. VARIABLE FIELD DEFINITIONS

- a Error code.
- 602 — Overload status change.
- b Overload condition.
- 0x81 — Spooler output process overload cleared.
- 0x82 — Spooler output process overload.
- 0x85 — Data link input buffer overload cleared.
- 0x86 — Data link input buffer overload.
- 0x87 — Data link output buffer overload cleared.
- 0x88 — Data link output buffer overload.
- 0x8b — IOP overload cleared.
- 0x8c — IOP command queue overload.
- 0x8f — DFC overload cleared.
- 0x90 — DFC overload.
- 0x91 — File manager overload cleared.
- 0x92 — File manager overload.
- 0x95 — User/supervisor level program lockout cleared.
- 0x96 — User/supervisor level program lockout overload.
- 0x97 — Timed event overload cleared.
- 0x98 — Timed event overload condition.
- 0x99 — Kernel level lockout cleared.
- 0x9a — Kernel level lockout overload condition.
- 0x9f — DCT entries allocation reduced to 50%.
- 0xa0 — DCT entries at 70% allocation.
- 0xa1 — DCT entries at 100% allocation.
- 0xac — Message buffers recovered to 50% allocation.
- 0xad — Message buffers at 70% allocation.
- c Stray fault code.
- 0xbc — Fault for queued error messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

0xbd — Fault for non-queued error messages.  
0xd1 — Page invalid or not in memory.  
0xd2 — Page index too large.  
0xd3 — Segment invalid.  
0xd4 — Segment index too large.  
0xd5 — Illegal DMERT operating system trap call.  
0xd6 — Protection violation.  
0xd7 — Byte of halfword addressing violation.  
0xd8 — Instruction privilege violation.  
0xd9 — Illegal op-code.  
0xda — Illegal switch between kernel and private stacks.

#### **4. ACTION TO BE TAKEN**

No action is necessary. If error persists, obtain technical assistance.

TYPE ..... Output

### 1. FORMAT

- [1] REPT AIMCHK STATUS PART m
- [2] REPT AIMCHK STATUS COMPLETED
- [3] REPT AIMCHK - FILE SYSTEM OVERFLOW WARNING k j
- [4] REPT AIMCHK - FILE SYSTEM OVERFLOW CRITICAL k j

### 2. REASON FOR OUTPUT

Formats 1 and 2 are printed as a result of the OP:AIM user command. The following section will be printed if event status is desired:

EVENTS/ERRORS  
ID NAME TASK SET TLEFT CURTRIG NEXTRIG LAST SET  
X'dd eeee llll yyy nnnnn cccccc gggggg tttttt

If action status is desired, the following section is printed next, one line per action:

ACTIONS/TASKS  
ID NAME RUNNABLE TIME LAST EXC  
X'dd aaaa bbbbbbb tttttttttt

Finally, if process status is desired, the following section is printed, one line per process:

PROCESSES/TASKS  
ID NAME INCAR STATE FSTAT PROCESSID UTILID RST LAST CREAT  
X'dd pppp iiii ssss ffff rrrrrrrr uuuuu zzz 000000000

Formats 3 and 4 are printed when AIM receives file system overload messages from SIM. The variable fields describe the file system in overload.

### 3. VARIABLE FIELD DEFINITIONS

- d AIM internal ID for the event, action or process.
- e Internal AIM event name.
- l Invoking task name (action or process).
- y YES or NO, indicating the event is set or not.
- n Time left for the event to time out.

## 1. FORMAT

- [1] REPT AIMCHK TASK QUEUE AUDIT FAILURE  
a TASK QUEUE: b ERRORS, CODE = X'c
- [2] REPT AIMCHK AUDITS INHIBITED
- [3] REPT AIMCHK AUDITS ALLOWED

## 2. REASON FOR OUTPUT

Format 1 reports an Application Integrity Monitor (AIM) task queue audit failure. All audit failures are corrected.

Format 2 reports that task queue audits are inhibited. This message is printed when audits are first inhibited (via application parameter A) and about every 17 minutes thereafter.

Format 3 reports that task queue audits have been allowed. This message is printed when audits are first allowed after being inhibited (via application parameter B).

## 3. VARIABLE FIELD DEFINITIONS

- a Task queue:
  - ACTIVE — active task queue.
  - FREE — free task queue.
- b Number of errors found.
- c Error code mask. One bit for each error:
  - X'00000001 — Lost ACTIVE task buffer.
  - X'00000002 — Lost FREE task buffer.
  - X'00000004 — Task number invalid in ACTIVE task buffer.
  - X'00000008 — Task duplicated on ACTIVE task list.
  - X'00000010 — Invalid task header (head or tail null).
  - X'00000020 — Task buffer state invalid.
  - X'00000040 — Tail pointer invalid for list.
  - X'00000080 — Invalid previous pointer for list.
  - X'00000100 — Invalid state detected while Processing.
  - X'00000200 — Invalid task number detected while Processing.
  - X'00010000 — Duplicate Application Sanity Timer (AST) reset task on active task queue.
  - X'00020000 — Invalid DMERT application process (DAP) id for monitoring DAP on active task queue.
  - X'00040000 — Duplicate or invalid monitoring task.

SEE PROPRIETARY NOTICE ON COVER PAGE

X'00080000 — No AST reset task on active task queue.  
X'00100000 — Lost monitoring task for DAP.

ID ..... REPT:AIMSTUB  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT AIMSTUB S

## 2. REASON FOR OUTPUT

Error messages are printed by the AIMSTUB process to indicate problems servicing requests for the AIM process. Typically these are caused by an invalid AIMFILE in PAS. Messages include:

### INVALID AIMFILE IN PAS - CANNOT ADOPT CHILDREN

Whenever the AIMSTUB process dies and gets recreated, it must re-adopt all UNIX® children that were left behind. If an invalid PAS AIMFILE exists, AIMSTUB cannot determine who was alive. In this case, AIM has an audit that should find these orphans.

### CANNOT OPEN OUTPUT FILE

AIMSTUB spools long messages to the ROP by breaking them up and placing them in temporary files in /tmp. If these files cannot be created, /tmp could possibly be full or some other file system error might have occurred. This can be ignored, however, no output will result from OP:AIM commands.

### INVALID AIMFILE IN PAS - CANNOT LIST STATUS

AIMSTUB must be able to read the AIMFILE in PAS in order to print status information. This can be ignored, but no OP:AIM information will be printed.

ID ..... REPT:AMA-CDR-FIFO  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has two formats.

- [1] REPT AMA CDR FIFO BAD RDW (FIFO FLUSHED)  
ULP = a \*ULP = b \*(ULP+1) = c
- [2] REPT AMA CDR FIFO PTRS BAD  
ULP = d LP = e END = f (FIFO FLUSHED)

## 2. REASON FOR OUTPUT

Format 1: When accessing an AMA record in the CDR FIFO, the size of the record is specified in the AMA Record Descriptor Word (RDW). The CDR FIFO unload pointer always points to an AMA RDW. An AMA RDW is a 32-bit field. The most significant 16 bits is the record length in bytes (including the RDW). The least significant 16 bits are zero. This message is printed when an RDW length is found to be less than or equal to 0 or greater than 512.

Format 2: When accessing an AMA record in the CDR FIFO and a CDR FIFO pointer is found to be out of range, then this message is printed. The legal range for CDR FIFO pointers is 0 to 169999.

The CDR FIFO is flushed. All AMA records (if any) in the FIFO are lost. No count is kept of the number of records lost.

The CDR FIFO is administered with three pointers: a load pointer, an unload pointer, and an end pointer. The load pointer points to the next FIFO location to be loaded with a new AMA record. If an AMA record will not fit between the load pointer and the FIFO end, then the end pointer is made equal to the load pointer and the load pointer is set to the FIFO top. The unload pointer points to the next AMA record to be unloaded from the FIFO. If the unload pointer is equal to the end pointer, then the unload pointer is set to the FIFO top.

## 3. VARIABLE FIELD DEFINITIONS

- a The value of the CDR FIFO unload pointer.
- b Hex value of the first 32 bits pointed to by the CDR FIFO unload pointer.
- c Hex value of the second 32 bits pointed to by the CDR FIFO unload pointer.
- d The value of the CDR FIFO unload pointer.

SEE PROPRIETARY NOTICE ON COVER PAGE

- |   |                                                                            |
|---|----------------------------------------------------------------------------|
| e | Hex value of the first 32 bits pointed to by the CDR FIFO unload pointer.  |
| f | Hex value of the second 32 bits pointed to by the CDR FIFO unload pointer. |

#### **4. ACTION TO BE TAKEN**

Information only, the CDR FIFO has been flushed. There exists no count of the number of AMA records lost due to the FIFO flush.

#### **5. REFERENCES**

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has nine formats.

- [1] REPT AMA CDR SESSION UNKNOWN INDICATOR a
- [2] REPT AMA CDR SESSION CONNECT REFUSED - b
- [3] REPT AMA CDR SESSION CONNECTED
- [4] REPT AMA CDR SESSION FAR END DISCONNECT  
FAR END USERDATA X'c  
RECORDS d BYTES e BUFS f
- [5] REPT AMA CDR SESSION FAR END ABORT FROM g(h)  
FAR END USERDATA X'i  
RECORDS d BYTES e BUFS f
- [6] REPT AMA CDR SESSION ABORT CODE j k  
RECORDS d BYTES e BUFS f
- [7] REPT AMA CDR SESSION ERROR l FROM m CAUSING RE-INIT  
RECORDS d BYTES e BUFS f
- [8] REPT AMA CDR SESSION MANUAL INHIBIT WRONG - n  
MANUAL INHIBIT CLEARED
- [9] REPT AMA CDR SESSION ERROR - TOO MANY INDICATIONS

## 2. REASON FOR OUTPUT

Format 1: When the AMA formatter is made aware of a Call Detail Recording (CDR) session indication, the specific indication is fetched from the session services manager. The indication fetched is processed. If an unknown indication is fetched from the session services manager, then this output message is generated.

Format 2: When the AMA formatter receives a Call Detail Recording (CDR) request for session connection and the connection cannot be honored, this message is printed.

Format 3: When the AMA formatter receives a Call Detail Recording (CDR) request for session connection and the connection is made, this message is printed. At this point the AMA formatter sends selected AMA records to the far end CDR processor over the CDR datalink or its backup. The selected AMA CDR records are buffered through a CDR FIFO before being written to the CDR session.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 4: The AMA formatter has processed a Call Detail Recording (CDR) session disconnect message. At this point no CDR datalink session exists. The AMA formatter can accept another CDR session connect request. Any AMA CDR selected records are held in the CDR FIFO until the next CDR session connect is made.

Format 5: The AMA formatter has processed a Call Detail Recording (CDR) session abort message. At this point no CDR datalink session exists. The AMA formatter can accept another CDR session connect request. Any AMA CDR selected records are held in the CDR FIFO until the next CDR session connect is made.

Format 6: The AMA formatter has sent a Call Detail Recording (CDR) session abort message. The abort was caused by a reason internal to the AMA formatter. At this point no CDR datalink session exists. The AMA formatter can accept another CDR session connect request. Any AMA CDR selected records are held in the CDR FIFO until the next CDR session connect is made.

Format 7: The AMA formatter has lost communication with the local session manager for the Call Detail Recording (CDR) session. The abort was caused by a reason internal to the AMA formatter. At this point no CDR datalink session exists, and none can be established until communication with local session services is restored. The AMA formatter takes automatic steps to restore communication with local session management. An attempt to send a session abort is made. The one-byte user data field in the session abort message is set to the value 5.

Any AMA CDR selected records are held in the CDR FIFO until the next CDR session connect is made.

Format 8: Every two seconds the AMA formatter audits the value of the manual inhibit flag. If the value is not 0 or 1, then this output message is generated.

Format 9: When the AMA formatter is given more than 8 indications from the session manager, this output is printed. The AMA formatter limits the number of indications processed to 8, to avoid spending too much kernel time processing indications. No more than 8 indications should arrive at any given time. If more than 8 indications are detected, the session is aborted with user data reason 5. The AMA formatter proceeds as if communication with the session manager was lost.

### 3. VARIABLE FIELD DEFINITIONS

- a                    Decimal value of the session indicator given to the AMA formatter by the session services manager.
- b                    One of the following phrases:  
  
                      CDR SESSION AUTO INHIBIT  
                      A CDR connection request is refused because an automatic inhibit is active. An automatic inhibit is activated whenever the CNI ring is going through recovery.

SEE PROPRIETARY NOTICE ON COVER PAGE

**CDR SESSION MAN INHIBIT**

A CDR session connection request is refused because a manual inhibit is active. A manual inhibit is activated by an INPUT command.

**CDR SESSION IP**

A CDR session connection request is refused because a CDR session is already in progress.

**INVALID USER DATA**

A CDR session connection request is refused because the user data associated with the session connect request is not valid. Session connect user data is a 2-byte field. Either the user data field length is wrong or the contents of the user data field are invalid.

- c Hex value of the first byte of user data associated with the session disconnect message.
- d Decimal number of AMA records sent to the CDR processor.
- e Decimal number of bytes sent to the CDR processor.
- f Decimal number of session buffers sent to the CDR processor.
- g A string indicating the source of the far end abort.
  - RMTUSER — Abort initiated by the remote user.
  - RMTSL — Abort initiated by remote session manager.
  - LOCSL — Abort initiated by local session manager.
  - FORCED — Session aborted for some other reason.
  - UNKN-SRC — Unknown abort source.
- h Negative decimal value of the abort source.
- i Hex value of the first byte of user data associated with the session abort message.
- j Decimal value of the abort reason. This is the value of the abort message user data field sent by the far end CDR processor (one byte).
- k A string describing the abort.

**MANUAL INH STARTED**

CDR session abort because of a manual inhibit.

**LOST LOCAL SESSION SYNC**

CDR session abort caused by failure to communicate with the local session manager.

**DATALOST**

CDR session abort due to data lost indication from the local session manager.

RETRY EQUIP/UNEQUIP REQUEST LATER  
c
- [4] REPT AMA CONFIG FILE FOR a STREAM  
NUMBER OF EQUIPPED PARTITIONS d  
TOTAL NUMBER OF AMA BLOCKS e  
[ f g h ]
- [5] REPT AMA CONFIG FILE FOR a STREAM  
NUMBER OF EQUIPPED PARTITIONS i  
TOTAL NUMBER OF s BLOCKS j  
[k l m]

## 2. REASON FOR OUTPUT

To provide responses to the OP:AMA-CONFIG and SET:AMA-CONFIG input messages.

## 3. VARIABLE FIELD DEFINITIONS

- a
  - DF — Deferred Formatting data stream.
  - DM — Disk Mode data stream.
  - IC — Inter-LATA automatic message accounting (AMA) data stream.
  - OC — Operating company AMA data stream.
- b Text phrase indicating the outcome of the operation requested by either the OP:AMA-CONFIG or SET:AMA-CONFIG input message.
- c Text phrase indicating why the EQUIP or UNEQUIP request must be tried at a later time.
- d Number of AMA partitions equipped for this stream.
- e Total number of AMA blocks for this stream.
- f AMA partition number.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                   |
|---|-----------------------------------------------------------------------------------|
| g | AMA partition file name.                                                          |
| h | Number of AMA blocks in this partition.                                           |
| i | Number of Deferred Formatting (or Disk Mode) partitions equipped for this stream. |
| j | Total number of Deferred Formatting (or Disk Mode) blocks for this stream.        |
| k | Deferred Formatting (or Disk Mode) partition number.                              |
| l | Deferred Formatting (or Disk Mode) partition file name.                           |
| m | Number of Deferred Formatting (or Disk Mode) blocks in this partition.            |
| s | Deferred Formatting or Disk Mode.                                                 |

If  $d = 0$ , then  $f$ ,  $g$ , and  $h$  will not appear in the output message.  $f$ ,  $g$ , and  $h$  will only be printed for each AMA partition that is equipped for this stream.

If  $i = 0$ , then  $k$ ,  $l$ , and  $m$  will not appear in the output message.  $f$ ,  $g$ , and  $h$  will only be printed for each AMA partition that is equipped for this stream.

#### 4. ACTION TO BE TAKEN

If Format 1 is printed, the SET:AMA-CONFIG message should be tried again, and either IC, OC, DF, or DM should be specified depending on which AMA data stream the user wishes to work on.

For Format 2, if  $b =$

CONFIG FILE COULD NOT BE OPENED  
Refer to AMA TOPS procedures for resolution.

CONFIG FILE COULD NOT BE READ  
Refer to AMA TOPS procedures for resolution.

COULD NOT ATTACH TO ECD DATABASE  
Seek technical assistance immediately.

COULD NOT OBTAIN INFORMATION ABOUT THE PARTITION  
Seek technical assistance.

COULD NOT RELEASE ECD DATABASE  
Seek technical assistance immediately.

COULD NOT RETRIEVE ECD ORIGIN RECORD  
Seek technical assistance immediately.

COULD NOT RETRIEVE ECD ORIGIN RECORD AND RELEASE ECD DATABASE  
Seek technical assistance immediately.

SEE PROPRIETARY NOTICE ON COVER PAGE

**COULD NOT RETRIEVE MDCT RECORD**

Seek technical assistance immediately.

**COULD NOT RETRIEVE UCB RECORD**

Seek technical assistance.

**DEVICE DOES NOT HAVE MAJOR/MINOR NUMBERS**

Seek technical assistance.

**EQUIP OR UNEQUIP OPTION MISSING FROM INPUT MESSAGE**

Be sure to include either the EQUIP or UNEQUIP option in the SET:AMA-CONFIG input message when it is reentered.

**EQUIP/UNEQUIP REQUEST FOR DM PARTITION STOPPED NOT AN AT&T SWITCH**

Check whether this is an AT&T switch before trying again.

**INVALID COMBINATION OF INPUT PARAMETERS**

Check for one of two errors in the SET:AMA-CONFIG message. First make sure only one of the following options is used - EQUIP or UNEQUIP, not both. Second, make sure the NOINIT option is not being used with the UNEQUIP option. Try the message again.

**INVALID ERROR CODE RECEIVED**

Refer to AMA TOPS procedures for resolution. **INVALID KEYWORD IN INPUT MESSAGE**

Check the last SET:AMA-CONFIG message to determine which keyword is invalid. Be sure to leave out the invalid keyword when the SET:AMA-CONFIG message is reentered.

**INVALID PARTITION NUMBER IN INPUT MESSAGE**

The SET:AMA-CONFIG input message should be reentered using a valid AMA partition number. If AMA SCSI Disk Capacity Expansion (585) feature is active, the valid partition numbers are 0 through 38. Otherwise the valid partition numbers are 0 through 23.

**INVALID SPECIAL DEVICE TYPE**

Seek technical assistance.

**NO INPUT DATA SPECIFIED**

The SET:AMA-CONFIG input message should be reentered. Be sure to include the fields needed after the second colon.

**NO UCB FOR THE DEVICE**

Seek technical assistance.

**PARTITION x WAS SUCCESSFULLY UNEQUIPPED**

Where x is the partition number (0-38). Indicates that the specified partition was successfully unequipped. No action is necessary.

**PARTITION NOT EQUIPPED FOR THIS STREAM**

The AMA partition specified in the SET:AMA-CONFIG message is not equipped for the requested stream. Enter the OP:AMA-CONFIG input message to determine the state of the configuration file(s) and proceed accordingly.

SEE PROPRIETARY NOTICE ON COVER PAGE

**PARTITION NUMBER IN INPUT MESSAGE NOT VALID FOR THIS OFFICE**  
Seek technical assistance.

**PARTITION NUMBER MISSING FROM INPUT MESSAGE**  
Reenter the SET:AMA-CONFIG input message and be sure to specify the PART keyword and a valid AMA partition number .

**REQUESTED PARTITION IS ALREADY EQUIPPED**  
The SET:AMA-CONFIG input message attempted to equip an already equipped partition. Use the OP:AMA-CONFIG input message to determine the state of the configuration file(s) and proceed accordingly.

**TEMPORARY FILE COULD NOT BE CREATED**  
A file could not be created to print the appropriate output message. Enter the OP:AMA-CONFIG input message to determine the state of the configuration file(s) and proceed accordingly.

**EQUIPPING PARTITION WOULD RESULT IN TOO MANY BLOCKS FOR THIS STREAM**  
The MSN (Maximum Sequence Number) of the control file indicates the maximum number of blocks that can be used for this stream. Equipping the partition would result in more than this number of blocks. If the HOC used for this stream is capable of processing blocks with higher sequence numbers than the MSN, then the control file MSN can be increased and the partition can be equipped; otherwise, no more partitions can be equipped for this stream.

**UNEQUIP REQUEST STOPPED  
CANNOT UNEQUIP THE LAST PARTITION  
ASSIGNED IN A [DF|DM] SWITCH**  
The UNEQUIP operation was stopped because this is the last partition assigned to the Deferred Formatting or Disk Mode data stream. For DF, Deferred Formatting capability must first be disabled using the SET:AMA-CONTROL input message. For DM, the 3B recording mode must be in APS. The recording mode can be changed by using the SET:AMA-RECMODE input message. Once Deferred Formatting or Disk Mode capability has been disabled, the partition can be unequipped.

**UNEQUIP REQUEST STOPPED  
THERE IS PRIMARY DATA ON THIS PARTITION**  
The UNEQUIP operation was stopped because there is primary data on the partition. Once all the primary data has been removed, the partition can be unequipped.

**UNEQUIP REQUEST STOPPED  
THERE IS DATA ON THIS PARTITION**  
The UNEQUIP operation was stopped because there is data on the Deferred Formatting or Disk Mode partition. Once all the data has been removed, the partition can be unequipped.

SEE PROPRIETARY NOTICE ON COVER PAGE

WARNING - AMA PARTITION COULD NOT BE OPENED  
UNEQUIP OPERATION CONTINUING

In this case, the AMA partition map could not be opened to determine if there was any primary data on the partition; therefore, the next time this partition is equipped it should be equipped using the NOINIT option so any primary data can be retrieved. IF THE NOINIT OPTION IS NOT USED, ANY PRIMARY DATA THAT WAS ON THIS PARTITION WILL BE LOST.

WARNING - AMA PARTITION COULD NOT BE READ  
UNEQUIP OPERATION CONTINUING

In this case, the AMA partition map could not be read to determine if there was any primary data on the partition; therefore, the next time this partition is equipped it should be equipped using the NOINIT option so any primary data can be retrieved. IF THE NOINIT OPTION IS NOT USED, ANY PRIMARY DATA THAT WAS ON THIS PARTITION WILL BE LOST.

WARNING - REQUESTED STREAM CONFLICTS  
WITH CURRENT AMA STREAM INDICATOR  
EQUIPPING PROCESS IS IN PROGRESS  
LOOK FOR FURTHER OUTPUT

This message indicates that an AMA partition is being equipped for an AMA stream that currently does not exist in the office. No action need be taken.

WARNING - THIS IS NOT A DEFERRED  
FORMATTING SWITCH  
EQUIPPING PROCESS IS IN PROGRESS  
LOOK FOR FURTHER OUTPUT

This message indicates that Deferred Formatting capability has not been enabled for this office. See the SET:AMA-CONTROL input message, if Deferred Formatting capability is desired. Otherwise, no action need be taken.

For Format 3, if C =

AMA PARTITION COULD NOT BE OPENED

- [3] REPT AMA CONTROL FILE AUDIT FOR a STREAM  
TEMPORARY FILE COULD NOT BE CREATED

## 2. REASON FOR OUTPUT

To indicate the state of the Automatic Message Accounting (AMA) control file after its audit has been run (Format 1), that the control file could not be opened or read (Format 2), or that the system could not allocate a temporary file to print the audit results (Format 3). This message is accompanied by a minor alarm.

## 3. VARIABLE FIELD DEFINITIONS

- a IC — Indicates that the information is for the Inter-LATA revenue accounting office data stream.  
OC — Indicates that the information is for the operating company revenue accounting office data stream.
- b Office identification.
- c Number of days until the tape expires.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                    |
|---|--------------------------------------------------------------------------------------------------------------------|
| d | Start time in hours and minutes for automatic tape writing or teleprocessing.                                      |
| e | Stop time in hours and minutes for automatic tape writing or teleprocessing.                                       |
| f | Default tape drive for the AMA function.                                                                           |
| g | Indicates the AMA option in effect.                                                                                |

| s | Indicates percentage of disk space containing primary data.                                                        |

#### 4. ACTION TO BE TAKEN

For Format 1, examine the values that the audit assigned to the fields in the control file. If any values need to be corrected, use the input messages listed under References.

If Format 2 prints, refer to the AMA TOPS procedure for further resolution.

If Format 3 prints, use the OP:AMA-CNTLFIL input message to check the contents of the control file. If any of the values are invalid, correct them using the input messages listed under References.

| h | Indicates whether or not the AMA data transfer sessions have been manually inhibited via the INH:AMA;SESS message.                                                                                                      |
| i | AMA teleprocessing (AMAT) password.                                                                                                                                                                                     |
| j | Host collector (HOC) password.                                                                                                                                                                                          |
| k | Backup HOC password.                                                                                                                                                                                                    |
| l | Password of last HOC that polled this AMAT.                                                                                                                                                                             |
| m | Indicates whether or not a tape writing or verification session is currently in progress.                                                                                                                               |
| n | Indicates whether or not a teleprocessing session is currently in progress.                                                                                                                                             |
| o | Indicates whether or not automatic tape writing has been inhibited via the INH:AMA-AUTOST message.                                                                                                                      |
| p | Next AMA tape sequence number.                                                                                                                                                                                          |
| q | Tape data set ID.                                                                                                                                                                                                       |
| r | Maximum delay from when a record is created until it is written to disk.                                                                                                                                                |
| s | Indicates whether or not SDN call detail recording records are being sent directly to CDDS II via the CDR link. This is only printed if the control file is for the Inter-LATA Carrier (IC) stream.                     |
| t | Identifies which stream is the fast stream. This only prints for the IC stream control file.                                                                                                                            |

SEE PROPRIETARY NOTICE ON COVER PAGE

- |   |                                                                                                                                                           |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| u | Indicates whether deferred formatting is turned off (NOT ALLOWED) or turned on (ALLOWED). This only prints for the IC stream control file.                |
| v | Identifies the 3B APS recording mode which are 3B, Call Detail Recording Platform (CDRP), or Transition. This only prints for the IC stream control file. |

#### **4. ACTION TO BE TAKEN**

If Format 1 prints, take no action. If Format 2 is output, reenter input message OP:AMA-CNTLFIL. If Formats 3, 4, 5, or 6 are output, reenter input message SET:AMA-CONTROL.

PARTITION c DISK MAP {UNAVAILABLE|NOT READABLE}
  
- [5] REPT AMA DISK MAPS FOR a STREAM  
TEMPORARY FILE COULD NOT BE CREATED
  
- [6] REPT AMA DISK MAPS FOR a STREAM  
COULD NOT OPEN CONFIGURATION FILE
  
- [7] REPT AMA DISK MAPS FOR a STREAM  
COULD NOT READ CONFIGURATION FILE

## 2. REASON FOR OUTPUT

To output the disk map(s) associated with a data stream.

For the data stream requested, the global map partition that is currently being written is output first, and then for each equipped partition in the configuration file, the partition's disk map is output.

Format 1 and Format 2 is printed for each equipped Automatic Message Accounting (AMA) partition.

Format 3 and Format 4 is printed for each equipped Deferred Formatting AMA partition.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

|    |                                                                                                                                         |
|----|-----------------------------------------------------------------------------------------------------------------------------------------|
| DF | Revenue accounting office data stream that the information is for Deferred Formatting (DF).                                             |
| IC | Revenue accounting office data stream that the information is for Inter-LATA (IC).                                                      |
| OC | Revenue accounting office data stream that the information is for Operating Company (OC).                                               |
| a  | Global map partition currently being written.                                                                                           |
| b  | Global map partition that contains oldest primary data that will be read first by tape/teleprocessing:<br><br>AVAILABLE<br><br>READABLE |
| c  | Partition number.                                                                                                                       |
| d  | First primary block offset.                                                                                                             |
| e  | Last primary block offset.                                                                                                              |
| f  | First primary block sequence number.                                                                                                    |
| g  | Last primary block sequence number.                                                                                                     |
| h  | First secondary block offset.                                                                                                           |
| i  | Last secondary block offset.                                                                                                            |
| j  | First secondary block sequence number.                                                                                                  |
| k  | Last secondary block sequence number.                                                                                                   |
| l  | First block in partition offset.                                                                                                        |
| m  | Last block in partition offset.                                                                                                         |
| n  | First block in partition sequence number.                                                                                               |
| o  | Last block in partition sequence number.                                                                                                |
| p  | Unload offset. The disk block offset into the partition which marks the beginning of Deferred Formatting data.                          |
| q  | Load offset. The disk block offset into the partition which marks the end of Deferred Formatting data.                                  |
| r  | Start of data area offset.                                                                                                              |
| s  | End of data area offset.                                                                                                                |

### 4. ACTION TO BE TAKEN

If the disk map or global map is not available or readable, see AMA TOPS procedures. Otherwise, no action is required.

## 1. FORMAT

- [1] REPT AMA DISK READER FOR a STREAM PARTITION b,  
AMA BLOCK WITH SEQ NO c IS OUT OF SEQUENCE  
EXPECTED SEQUENCE NUMBER IS d  
OFFSET OF BLOCK INTO AMA PARTITION IS e DISK BLOCKS
- [2] REPT AMA DISK READER FOR a STREAM PARTITION b,  
AMA BLOCK WITH SEQ NO a IS BEING IGNORED
- [3] REPT AMA DISK READER FOR a STREAM PARTITION b,  
SIZE OF f DATA AREA IS NOT A MULTIPLE OF 3 DISK BLOCKS
- [4] REPT AMA DISK READER FOR a STREAM,  
END OF SESSION UPDATING OF DISK MAPS FAILED.  
SEQUENCE NUMBERS g THROUGH h  
MUST BE RETRIEVED AGAIN AS SECONDARY DATA.
- [5] REPT AMA DISK READER FOR a STREAM  
CAN NOT i j

## 2. REASON FOR OUTPUT

To report that an automatic message accounting (AMA) block is out of sequence and to report the disposition of the block (Formats 1 and 2); to report an invalid disk map (Format 3); or to report that the disk reader was unable to update some primary blocks to secondary status, and indicate which primary blocks were already marked secondary when the error occurred (Format 4).

## 3. VARIABLE FIELD DEFINITIONS

- a AMA data stream to which message applies:
  - IC — Inter-LATA AMA data stream.
  - OC — Operating company AMA data stream.
- b AMA partition number to which message applies.
- c Sequence number of AMA block that is out of sequence.
- d Sequence number that should have been in the AMA block.
- e Offset in disk blocks where the AMA block is located (from start of partition).
- f Data area (PRIMARY or SECONDARY) that is not a multiple of 3 disk blocks.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                |
|---|--------------------------------------------------------------------------------|
| g | Sequence number of first AMA block that must be reretrieved as secondary data. |
| h | Sequence number of last AMA block that must be reretrieved as secondary data.  |
| i | OPEN<br>READ                                                                   |
| j | CONFIGURATION FILE<br>GLOBAL MAP                                               |

#### **4. ACTION TO BE TAKEN**

For Format 4 messages, the indicated blocks should be retrieved as secondary data according to local procedures. If Format 1, 3, or 4 messages are seen repeatedly, seek technical assistance (Several Format 2 messages may accompany each Format 1 message). If Format 5, seek technical assistance.

## 1. FORMAT

REPT AMA DISK STORAGE IS a% FULL FOR b STREAM

## 2. REASON FOR OUTPUT

To report the potential loss of billing data. A major, minor, or critical alarm may accompany this message.

## 3. VARIABLE FIELD DEFINITIONS

a                      Percentage of automatic message accounting (AMA) disk space occupied by primary data.

**NOTE:** If a = 70-89, a minor alarm occurs.  
          If a = 90-99, a major alarm occurs.  
          If a = 100, a critical alarm occurs.

b                      IC — Indicates that the information is for the Inter-LATA revenue accounting office data stream.  
                        OC — Indicates that the information is for the operating company revenue accounting office data stream.

## 4. ACTION TO BE TAKEN

Refer to AMA TOPS procedures for specific instructions.

- [5] REPT AMA DISK WRITER FOR a STREAM  
g
- [6] REPT AMA DISK WRITER PRIMARY DATA FOR a STREAM  
h

## 2. REASON FOR OUTPUT

To report an automatic message accounting (AMA) disk writer related software error condition (messages 1-4), or status of AMA data stored on disk (messages 5-6).

## 3. VARIABLE FIELD DEFINITIONS

- a AMA stream to which the message applies:
  - IC — Inter-LATA AMA data stream.
  - OC — Operating company AMA data stream.
- b Disk writer error type:
  - 1 — Unexpected event received.
  - 2 — Unexpected message received.
  - 3 — Too many unexpected messages received.
  - 4 — Primary disk copy of disk map was corrupted.
  - 6 — Both disk copies of disk map were corrupted.
  - 7 — Could not allocate a message buffer.
  - 8 — Could not queue a message.
  - 9 — Could not attach the equipment configuration database (ECD).
  - 10 — Could not release the ECD.
  - 11 — Could not read ucb record from ECD.
  - 12 — Could not read eiapt record from ECD.
  - 13 — Could not read mdct record from ECD.
  - 14 — Could not get partition logical device identification number (LDIN) from file manager.
  - 15 — Could not read partition disk map.
  - 16 — Could not write partition disk map.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 17 — Could not write data from shared segment (SDS) buffer.
- 18 — Configuration file open failed.
- 19 — Configuration file read failed.
- 20 — Configuration file audit failed.
- 21 — Global map open failed.
- 22 — Global map read failed.
- 23 — Global map create failed.
- 24 — Global map write failed.
- 25 — Global map audit failed.
- 26 — Global map was rebuilt.
- 27 — No AMA partitions are equipped.

c Additional information about the error:

If b = 4, 6, or 14 through 17,  
c = AMA partition number to which message applies.

If b = 18 through 25,  
c = copy of file to which message applies:

PRIM — Primary copy.  
BKUP — Backup copy.

d Disk writer termination code:

- 1 — Could not connect to a message port.
- 2 — A terminate request was received from another process.
- 3 — Disk writer was faulted during initialization.
- 4 — Disk writer was faulted during an internal audit.
- 5 — Disk writer was faulted when it was running.
- 6 — Disk writer memory corruption detected.
- 8 — Too many unexpected faults received.
- 9 — IOBADMSG returned from the disk driver.
- 10 — FLT\_BADOST return from the disk driver.
- 11 — BADPORT returned from a kportid kernel call.
- 21 — An internal sanity check failed.
- 22 — Both copies of configuration file were inaccessible or unusable.
- 101 — Too many type 1 errors.
- 102 — Too many type 2 errors.
- 104 — Too many type 4 errors.
- 106 — Too many type 6 errors.
- 107 — Too many type 7 errors.
- 108 — Too many type 8 errors.

e Hexadecimal number representing the fault code of the disk writer.  
See Output Appendix APP:DFC-F for a description of the fault codes.

f Hexadecimal number representing the virtual address if the writer was running.

SEE PROPRIETARY NOTICE ON COVER PAGE

- g Current read and write partition numbers. Values are:
- WRITE PARTN a READ PARTN b
- a — Partition currently being written.
  - b — Partition that contains oldest primary data that will be read first by tape/teleprocessing.
- h Location primary AMA data on a disk partition. Printed for each AMA partition equipped for this stream. Values are:
- PRTN a:
- FPR b LPO c FPS d LPS e  
FBO f LBO g FBS h LBS i
- a — Partition number.
  - b — First primary block offset.
  - c — Last primary block offset.
  - d — First primary block sequence number.
  - e — Last primary block sequence number.
  - f — First block in partition offset.
  - g — Last block in partition offset.
  - h — First block in partition sequence number.
  - i — Last block in partition sequence number.

#### 4. ACTION TO BE TAKEN

If b=6, or 9-27; d=1, 9, or 22; or anytime format 4 is output, refer to AMA TOPS procedures for further resolution. Formats 5 and 6 are status information messages only; no specific action is required. If any message appears several times, seek technical assistance.

- [111] REPT AMA FORMATTER - FAILED TO GET MSG BUFFER TO WRITE RC REQ  
MSG TO IN NODE
- [112] REPT AMA FORMATTER - FAILED TO BUILD IMS HDR TO WRITE RC REQ  
MSG TO IN NODE
- [113] REPT AMA FORMATTER - FAILED TO WRITE IMS RC REQ MSG TO IN NODE

## **2. REASON FOR OUTPUT**

To report error conditions encountered by the Automatic Message Accounting (AMA) formatting routine.

Format 1 is printed when the AMA formatter cannot attach to its port.

Format 2 is printed when the AMA formatter has been notified to terminate.

Format 3 is printed when the AMA formatter discards a billing record that contains invalid data.

Format 4 is printed when field update notifies the AMA formatter to stop. This should occur for a system update.

Format 5 is printed when field update has taken too long. It also is a warning that AMA data is being buffered and if field update takes too long, AMA data will be lost on the 1B.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 is printed when the AMA formatter is still stopped after waiting an hour for field update to complete. The AMA formatter has started processing AMA data again.

Format 7 is printed when field update has notified the AMA formatter to continue processing. The AMA formatter has started processing AMA data again.

Format 8 is printed when the receive buffer load or unload pointer is found out of range.

Format 9 is printed when either one or both of the Shared Data Segment (SDS) pointers for the given stream is found out of range on initialization.

Format 10 is printed when the formatter cannot save records in the SDS for the given stream on initialization.

Format 11 is printed when the formatter encounters an error.

Format 12 is printed when a record is received for the given stream and the office is not set up for the given stream.

Format 13 is printed when the SDS for the given stream becomes full.

Format 14 is printed when AMA formatter receives a fault event.

Format 15 is printed when AMA formatter completes initialization.

Format 16 is printed when AMA formatter could not access CINMAP file.

Format 17 is printed when a mutilated CINMAP record is encountered.

Format 18 is printed when AMA formatter detects that a CINMAP record is lost.

Format 19 is printed when a CINMAP buffer overflows.

Format 20 is printed if AMA formatter did not receive an expected trunk status event.

Format 21 is printed when the usage of AMA recording register reaches 90% (100%).

Format 22 is printed to show the number of call events discarded in a 5-minute period due to loss of answer event or no available register.

Format 23 is printed when AMA formatter receives an unexpected call event.

Format 24 is printed during a retrofit to indicate that all the AMA records have been written to disk.

Format 25 is printed when a call has been up over two or more midnights.

Format 26 is printed when the formatter is unable to access the Equipment Configuration Database (ECD) to report AMA disk status.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 27 is printed when the formatter is unable to access the Equipment Configuration Database Unit Control Block for an AMA disk to report its status.

Format 28 is printed when the formatter is unable to determine the process ID of an AMA / International Call Detailed Recording (ICDR) disk writer process, because the writer is not attached to its application port. It is likely that the indicated disk writer process is not running.

Format 29 is printed when the formatter is reporting AMA status as a result of SDS buffer overflow or in response to a user request. It indicates that an AMA/ICDR stream is not activated for recording.

Formats 30 and 31 are printed when the formatter is reporting AMA status as a result of SDS buffer overflow, or in response to a user request on the Emergency Action Interface (EAI) page.

Format 32 is printed when the recording mode is changed.

Format 33 is printed when a request to remove a Interface Node (IN) node is denied because the link is in service.

Format 34 is printed to show the number of ICDR call events discarded in a 5-minute period due to loss of answer event or no available register.

Format 35 is printed when the switch is administered for deferred formatting or disk mode stream capability, but there are no disk partitions equipped for deferred formatting or disk mode.

Format 36 is printed when the formatter is unable to obtain a message buffer to send a Deferred Formatting (DF) or Disk Mode (DM) Input/Output (I/O) message to Real Time Reliable (RTR).

Format 37 is printed when the specified deferred formatting or disk mode config file is mutilated.

Format 38 is printed when the deferred formatting or disk mode job queue is mutilated.

Format 39 is printed when the formatter's copy of the config file is mutilated.

Format 40 is printed when the specified copy of a deferred formatting or disk mode disk map is mutilated.

Format 41 is printed when the specified deferred formatting or disk mode disk map has been initialized. Any data that was previously stored on that partition is no longer accessible to the formatter. The formatter will only initialize a disk map, if both the primary and the backup disk maps have been mutilated.

Format 42 is printed when the specified copy of the deferred formatting or disk mode global map file is mutilated.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 43 is printed when the formatter receives an unexpected deferred formatting or disk mode message from RTR.

Format 44 is printed when the formatter rebuilds the deferred formatting or disk mode global map file. Every office will see this message when the formatter first builds the global map file, and any time the file is re-built because the file is mutilated.

Format 45 is printed when the formatter has successfully completed the initialization sequence for deferred formatting or disk mode. If Deferred formatting initialization is complete, its capability is now exists and can be activated by the formatter, if necessary.

Format 46 is printed when the formatter is unable to send a deferred formatting or disk mode message type to RTR.

Format 47 is printed when the formatter cannot access the deferred formatting or disk mode config file.

Format 48 is printed when deferred formatting or disk mode capability does not exist, because the formatter could not obtain a useable copy of the deferred formatting or disk mode config file.

Format 49 is printed when the formatter cannot get the specified partition's Logical Device Identification Number (LDIN) from the file manager.

Format 50 is printed when the formatter is unable to complete the specified I/O request.

Format 51 is printed when the formatter receives an I/O error trying to read or write a deferred formatting partition.

Format 52 is printed when the formatter receives an I/O error trying to read or write a deferred formatting partition disk map.

Format 53 is printed when the formatter has retired the deferred formatting or disk mode disk alarm. Disk occupancy has fallen below the MINOR alarm threshold.

Format 54 is printed when the formatter sounds an alarm, because the deferred formatting or disk mode disk occupancy has surpassed an alarmable threshold.

Format 55 is printed when the formatter downgrades the alarm status of the deferred formatting or disk mode disk.

Format 56 is printed when the deferred formatting write buffer has overflowed.

Format 57 is printed when deferred formatting is no longer active, i.e., records are not being deferred.

Format 58 is printed when the AMA formatter rejected the input command because deferred formatting is not active.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 59 is printed when the input message specifies a record limit greater than 1000, or less than 1. The deferred formatting delay can be studied only in groups of 1000 or less.

Format 60 is printed when deferred formatting is active, and the record limit is any number in the range of 1 to 1000. The maximum, minimum and mean deferred delay time are values sampled in the next given number of records limit when input message is entered. The mean of deferred delay is the average of all deferred delay time in the given number of records limit. These values are printed in the form of hours(s), minutes(s), and second(s).

Format 61 is printed when the AMA formatter begins to read event data from DM disk at the first time.

Format 62 is printed when the AMA formatter turns off disk mode

Format 63 is printed when the AMA formatter was signaled by the AIM process that EAI application parameter is set.

Format 64 is printed when the AMA formatter attempts to turn off disk mode while skip disk is set or disk mode status is not available

Format 65 is printed when the AMA formatter could not allocate a buffer that will hold message to be sent to the Inter-Lata Carrier (IC) monitor for updating DM disk alarm

Format 66 is printed after an audit fail of a DM disk map for resetting skip disk flag.

Format 67 is printed when a DM disk partition has its forward or backward pointer pointing to a non equipped partition.

Format 68 is printed when the AMA formatter is rebuilding the DM global map and an attempt to read disk map for the read partition was failed.

Format 69 is printed when the DM writing partition cannot be accessed for writing.

Format 70 is printed when the DM read partition cannot be accessed for reading.

Format 71 is printed when a IN link state change request is deemed invalid.

Format 72 is printed when an error is detected in the Call Detail Recording Platform (CDRP) 3B/IN Status Table.

Format 73 is printed when the IN links change states.

Format 74 is printed when the formatter can't attach to the ECD.

Format 75 is printed when a IN link is in the active or standby state, but the IN node is not active.

Format 76 is printed when a polling error is detected on the IN node.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 77 is printed when a IN node major state in the ECD is determined to be invalid.

Format 78 is printed when the formatter is able to attach to the ECD, but is not able to get the ECD record.

Format 79 is printed when the formatter cannot allocate a message buffer to send the filter event information.

Format 80 is printed when the formatter cannot close the IN channel.

Format 81 is printed when an audit of the CDRP 3B/IN Status Table has detected an invalid message pointer.

Format 82 is printed when an audit of the CDRP 3B/IN Status Table has detected both IN links as being in the in-service state.

Format 83 is printed when an audit of the CDRP 3B/IN Status Table has detected an invalid load pointer.

Format 84 is printed when an audit of the CDRP 3B/IN Status Table has detected an invalid unload pointer.

Format 85 is printed when a IN link becomes active.

Format 86 is printed when one of the IN links of a duplex pair goes out of service.

Format 87 is printed when both of the IN links of a duplex pair go out of service.

Format 88 is printed when the formatter receives an unknown message from Interprocess Message Switch (IMS).

Format 89 is printed when the formatter fails to get a message buffer to write a message to the IN node.

Format 90 is printed when the formatter cannot open the IMS channel to the IN node.

Format 91 is printed when the formatter fails to write an IMS message to the IN node.

Format 92 is printed when the formatter fails to build an IMS header to write a message to the IN node.

Format 93 is printed when an audit of the CDRP 3B/IN Status Table has detected an inconsistency between the IN link major state in the ECD and its minor state in the status table.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 94 is printed when the formatter cannot send the event filter message, because there is no IN node.

Format 95 is printed in response to a situation detected by the AMA and ICDR receiver process.

Format 96 is printed when a START:PING command is issued from the craft to an Ethernet® Interface Node (EIN) node with a link which is not Out Of Service (OOS).

Format 97 is printed when a START:PING command is successful.

Format 98 is printed when a START:PING command is unsuccessful due to bad Internet Protocol (IP) address, timer expired, network unreachable or port unreachable.

Format 99-100 is printed when a START:PING command is failed, check the error number or return code

Format 101 is printed when a START:PING command rejected by EIN 0 or EIN 1 because it's link is not OOS (link state can change to In Service (IS) / Standby (STBY) from OOS between the craft input time and the time EIN receives the request).

Format 102-106 is printed when the formatter can not send the PING request from craft to the EIN due to IMS problems.

Format 107-108 is printed when the formatter can not send a recent change update notice to the monitor so that the monitor can update the disk file.

Format 109-113 is printed when the formatter can not send a recent change update notice to the EIN due to IMS problems.

### **3. VARIABLE FIELD DEFINITIONS**

- a Stream type:
  - IC — Inter- Local Access Transport Area (LATA) carrier AMA data stream.
  - ICDR — ICDR stream.
  - OC — Operating company AMA data stream.
- b Record call code.
- c Address of the record lost.
- d Receive buffer pointer type:
  - LOAD — Load pointer.
  - UNLOAD — Unload pointer.
- e PAS in the receive buffer.

p1 3B TURNS ON DISK MODE — The receiver turns on disk mode.  
COULD NOT ATTACH TO MESSAGE HANDLER — The receiver could not attach to the message handler and therefore could not converse with 1B programs.  
COULD NOT DEVELOP RECEIVE BUFFER — The segments that make up the receiving buffer could not be indexed or locked into memory.  
DISKMODE RECEIVE BUFFER POINTER OUT OF RANGE — Some part of the disk mode receiving buffer's load, process, and/or unload pointers failed a range check.  
DM DISK STATUS UNAVAILABLE CANNOT TURN ON DISK MODE — The receiver could not turn on disk mode due to DM disk status not available at the moment.  
FAULT THRESHOLD REACHED f1 — An internal fault counter has reached its threshold.  
MESSAGE HANDLER PROCESS ID HAS CHANGED — Previous attachment to message handler is invalid because message handler appears to have been killed and restarted.  
RECEIVE BUFFER POINTER OUT OF RANGE — Some part of the receiving buffer's load and/or unload pointers failed a range check.  
RECEIVE BUFFER POINTERS — The current status of the AMA/ICDR receive buffer.

SEE PROPRIETARY NOTICE ON COVER PAGE

|    |                                                                                                                                                                 |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | RECEIVED FAULT EVENT WHILE RUNNING — The process received a fault entry while it was running and a problem in the receiver was probably the cause of the fault. |
|    | RESTARTING FLOW TO 3B AFTER RETROFIT — A retrofit procedure has completed or has been aborted. The receiver is once again accepting data from the 1B.           |
|    | SKIPDISK IS SET CANNOT TURN ON DISK MODE — The receiver could not turn on disk mode due to skip disk is set.                                                    |
|    | STOPPING FLOW TO 3B FOR RETROFIT — A retrofit procedure has begun and so the receiver is not accepting data from the 1B.                                        |
|    | TERMINATION HAS BEEN REQUESTED — A manual request to terminate has been received.                                                                               |
| q1 | Receive buffer unload pointer segment number.                                                                                                                   |
| r1 | Receive buffer unload pointer offset into segment.                                                                                                              |
| s1 | Receive buffer load pointer segment number.                                                                                                                     |
| t1 | Receive buffer load pointer offset into segment.                                                                                                                |
| u1 | Receive buffer occupancy.                                                                                                                                       |
| v1 | State of receive buffer alarm.                                                                                                                                  |
|    | DEFERRED FORMATTING DISK STATUS IS NOT AVAILABLE CANNOT ACTIVATE DEFERRED FORMATTING — The deferred formatting feature cannot be activated.                     |
|    | DEFERRED FORMATTING IS ACTIVE — The Deferred Formatting feature has been activated.                                                                             |
| w1 | PROCESS TERMINATING AND RESTARTING — This message prints whenever the error situation is such that the receiver must be killed and restarted.                   |
| x1 | Error number<br>BAD IP ADDRESS<br>PORT UNREACHABLE<br>PROTOCOL UNREACHABLE<br>TIMER EXPIRED                                                                     |
| y1 | Error number(see <code>ein_ping.h</code> and <code>errno.h</code> )                                                                                             |
| z1 | IP address from input command                                                                                                                                   |
| a2 | Return code(see <code>ein_ping.h</code> and <code>errno.h</code> )                                                                                              |

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For formats 1-5 and 10-15, refer to AMA Task Oriented Procedures (TOPS) document for specific actions.

Formats 6-9 should only occur during a system update. If one of these messages is output and a system update is not being done, seek technical assistance.

Format 6 is output when the AMA formatter stops when notified by field update, and indicates that it is no longer processing AMA data.

Format 7 is a warning that field update has taken too long and AMA data will probably be lost if field update does not complete quickly. If a problem exists, first get the AMA formatter process ID by using the `OP:ST-PROC` input message and look for the process `AMformat`. Then kill the AMA formatter by using the `STOP:E-USER` input message with the process ID for `AMformat`.

Formats 8 and 9 indicate that the AMA formatter has started processing data again. In both cases, field update must be run again.

For formats 16-19, if one of these messages is seen, use the manual input message on the 1B to restart the update. If the message is seen again, kill the formatter as described in the previous paragraph. Try the manual update again. If problems still exist, seek technical assistance.

For format 20, check to see if Attached Processor Interface (API) is out of service. If the message is repeatedly seen, seek technical assistance.

For formats 21, 23, 24, 25, 26 and 27 no action need be taken.

For formats 22 and 34, a possible receive buffer overflow may be indicated. Check to see if disk writer (`AMDwriteroc/ic`) is running.

Format 28 indicates that an AMA/ICDR disk writer may not be running. If possible, determine by means of the `OP:AIM-PROC` command whether the indicated process is running; if the process is not running and this condition persists, attempt to re-start the process manually by means of the `EXC:AIM` command (with `PROC` option).

Formats 29, 30 and 31 are status information messages; no specific action is required.

Format 32 is a response to a request to change the recording mode. No action is required.

For format 33, the link must be changed to the standby state before the node can be removed. This can be done via the `CHG:SLK` input message.

For format 35, no disk partition has been equipped for the Deferred Formatting feature. Enter the `OP:AMA-CONFIG` input message to determine the current state of the configuration file(s), and then enter the `SET:AMA-CONFIG` message accordingly.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 36-46 are status information messages; no specific action is required. However, if any of the messages appear several times, seek technical assistance.

For formats 47-56 seek technical assistance.

Format 57-58 is a status message; no specific action is required.

Format 59, record limit from input message is out of range, retry input message with new value.

Format 60 is an information message responding to requested input; no specific action is required.

Format 61-63 is a status message; no specific action is required.

Format 64-67 are status information messages; no specific action is required. However, if any of the messages appear several times, seek technical assistance.

Format 68-70 seek technical assistance.

Format 71 is an information message; no specific action is required.

Format 72 seek technical assistance.

Format 73 is an information message; no specific action is required.

Format 74-81 seek technical assistance.

Format 82 is an information message; no specific action is required.

Format 83-84 seek technical assistance.

Format 85 is an information message; no specific action is required.

Format 86 one of the IN links have been taken out of service. Restore the other link via CHG:SLK (xx,y);ARST to resume duplex operation and retire the alarm condition.

Format 87 both of the IN links have been taken out of service. Restore the links via CHG:SLK (xx,y);ARST to resume normal operation and retire the alarm condition.

Format 88 is an information message; no specific action is required.

Format 89-92 seek technical assistance.

Format 93-94 is an information message; no specific action is required.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 95 requires the following actions: STOPPING FLOW..., and RESTARTING FLOW..., and 3B TURN ON DISKMODE, and RECEIVE BUFFER POINTERS are information only messages. No action is required by these messages.

DEFERRED FORMATTING DISK STATUS IS NOT AVAILABLE CANNOT ACTIVATE DEFERRED FORMATTING - Seek technical assistance.

DM STATUS UNAVAILABLE CANNOT TURN ON DISKMODE - Seek technical assistance.

DEFERRED FORMATTING IS ACTIVE - Is an information-only message; no action is required.

Format 96,101, take link OOS and try again.

Format 97, No action required.

Format 98-100, check the IP address and the error number.

Format 102-113 seek technical assistance.

For the rest of the messages, no action is needed for isolated incidents. If problem persists, seek technical assistance.

ID ..... REPT:AMA-ICDR-TRN  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT AMA/ICDR TRANSFER BUFFER ALARM  
a

## 2. REASON FOR OUTPUT

To report that the automatic message accounting (AMA) and international call detail recording (ICDR) (if office is so equipped) receiving buffer has encountered an alarm situation.

## 3. VARIABLE FIELD DEFINITIONS

a                      BUFFER IS x% FULL  
A minor alarm accompanies this message if the buffer is 25%-74% full.  
A major alarm accompanies this message if the buffer is 75%-94% full.  
A critical alarm is made if the buffer is 95% full or more.

DOWNGRADE 3B BUFFER ALARM TO MAJOR AT x% FULL  
A critical alarm is downgraded to a major alarm if the buffer occupancy has fallen to between 71% and 90% full.

DOWNGRADE 3B BUFFER ALARM TO MINOR AT x% FULL  
A major alarm is downgraded to a minor alarm if the buffer occupancy has fallen to between 21% and 70% full.

RETIRE 3B BUFFER ALARM AT x% FULL  
A minor alarm is retired if the buffer is under 20% full.

## 4. ACTION TO BE TAKEN

For downgrades, no action is necessary. Alarm messages are most often preceded by AMA disk alarms. If so, handle the disk alarm situation. Otherwise, make sure the AMformat, AMdwriteric, and AMdwriteroc are running. If these actions don't work, refer to AMA/ICDR TOPS procedure.

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT AMA MONITOR FOR a STREAM b  
[c]  
[d]

## 2. REASON FOR OUTPUT

To print in response to an Automatic Message Accounting (AMA) input message or an event detected by the AMA monitor process.

## 3. VARIABLE FIELD DEFINITIONS

- a                    IC — Inter- Local Access Transport Area (LATA) AMA data stream.  
                    OC — Operating company AMA data stream.
- b                    AMA AUTO TAPE SESSION ABORTED — Indicates that the auto tape session was not successfully started or was terminated abnormally.
- AMA MAINTENANCE FILE INITIALIZED — The AMA maintenance file could not be opened. A new maintenance file was created and initialized.
- AMA SESSION ABORTED — Indicates that a tape or teleprocessing session was not successfully started or was terminated abnormally.
- CANNOT CREATE AMA MAINTENANCE FILE — The AMA maintenance file could not be opened and a new file could not be created.
- CONTROL FILE BACKUP FAILED — Indicates that the memory copy of the AMA control file could not be backed up to disk; if this prints in response to an input message, the most recent change to the control file will probably not be permanent.
- CONTROL FILE CHANGE ABORTED — The control file was not updated because an AMA session was in progress or because the control file was audited.
- CONTROL FILE INITIALIZED — During initialization, the disk copy of the control file did not exist or was unreadable; a new control file was created and initialized with default values.
- INIT COMPLETE — The AMA monitor process was successfully started or restarted.

SEE PROPRIETARY NOTICE ON COVER PAGE

INIT FAILED—The AMA monitor process was not successfully started or restarted.

INVALID MESSAGE RECEIVED FROM DISK WRITER—A disk occupancy message from the AMA disk writer process contained garbled information. The disk occupancy information reported by the REPT:AMA-D-SUM output message may no longer be accurate.

SANITY CHECK FAILURE—An internal sanity check failed.

SOME AMA MTC RECORDS UNREADABLE—Some or all of the AMA maintenance file could not be read. Attempt to read maintenance file returned less than 7 full maintenance records.

STREAM FILE INITIALIZED—The AMA data stream file could not be opened. A new stream file was created and initialized.

RECENT CHANGE DISK FILE COULDN'T BE OPENED—The recent change disk file containing the Internet Protocol (IP) addresses, Call Detail Recording Platform (CDRP) ID and passwords for Ethernet® Interface Node (EIN) / CDRP configuration can not be opened.

FAILED TO WRITE RC PARAMETERS TO DISK FILE—The recent change parameters for EIN/CDRP configuration can not be written to disk file from PAS.

OPEN FAILED FOR RC FILE, RECREATING RC FILE—The recent change disk file containing parameters for EIN/CDRP configuration can not be opened so that monitor is recreating the file with default values.

CANNOT CREATE RC FILE—The recent change disk file containing parameters for EIN/CDRP configuration can not be created.

CANNOT WRITE RC FILE—The recent change disk file containing parameters for EIN/CDRP configuration can not be written.

C

Reason for abort or failure:

AMA SESSIONS ARE INHIBITED

AMA SESSION ALREADY IN PROGRESS

AMA SESSION IN PROGRESS

BAD PROCESS-TYPE PARAMETER IN AMSTART\_PROC

BAD TIMER DURATION PARAMETER IN AMSET\_TIMER

BAD TIMER INDEX PARAMETER IN AMSET\_TIMER

BAD TIME PARAMETER IN AMTIME\_UNTIL

CONTROL FILE WAS AUDITED

COULD NOT ATTACH TO PROTECTED APPLICATION SEGMENT

SEE PROPRIETARY NOTICE ON COVER PAGE

COULD NOT CONNECT TO MESSAGE PORT  
COULD NOT CREATE CHILD PROCESS  
COULD NOT ENABLE MESSAGE RECEPTION  
COULD NOT INITIALIZE CONTROL FILE  
COULD NOT INITIALIZE STREAM FILE  
COULD NOT START WITHIN AUTOSTART WINDOW  
INTERNAL INCONSISTENCY FOLLOWING CONTROL FILE AUDIT  
OFFICE-DEPENDENT VALUES MUST BE RESET  
OFFICE OPTION IS NOT TAPE  
RECVW CALL FAILED  
SANITY TIMER RUNOUT  
STREAM VALUE MUST BE RESET  
d MONITOR TERMINATING AND RESTARTING AFTER 60 SECS

#### 4. ACTION TO BE TAKEN

If variable b = AMA AUTO TAPE SESSION ABORTED and:

variable c is COULD NOT START WITHIN AUTOSTART WINDOW, manually establish a tape session if one is desired before the next scheduled auto tape session.

variable c is AMA SESSIONS ARE INHIBITED, AMA sessions must first be allowed, and then a session must be manually established if one is desired before the next scheduled auto tape session. If automatic tape sessions are not desired at all, then the autostart feature should be inhibited to suppress this message in the future.

variable c is CONTROL FILE WAS AUDITED, verify that the control file is correct following the audit, and manually establish a tape session if one is desired before the next scheduled auto tape session.

If variable b = AMA SESSION ABORTED and:

variable c is AMA SESSION ALREADY IN PROGRESS, take no action.

variable c is OFFICE OPTION IS NOT TAPE or AMA SESSIONS ARE INHIBITED, change the appropriate item in the control file and retry the operation.

variable c is COULD NOT CREATE PROCESS, retry the operation and seek technical assistance if the error persists.

SEE PROPRIETARY NOTICE ON COVER PAGE

variable c is SANITY TIMER RUNOUT and a tape session was in progress, manually establish a new tape session using a different tape. The aborted session will not have closed off the tape properly.

If variable b = CONTROL FILE BACKUP FAILED,  
the most recent changes to the control file may not be permanent and may have to be redone if the AMA monitor process restarts for any reason. Seek technical assistance if the problem persists.

If variable b = CONTROL FILE CHANGE ABORTED and:

variable c is AMA SESSION IN PROGRESS, retry the operation after the AMA session is complete.

variable c is CONTROL FILE WAS AUDITED, verify that the control file is correct following the audit and retry the operation.

If variable b = CONTROL FILE INITIALIZED,  
set office-dependent data before any AMA sessions are established. The control file will contain default values. If the office option is tape, notify the Regional Accounting Office that the tape sequence number has been reset to 1.

If variable b = INIT COMPLETE, take no action.

If variable b = INIT FAILED,  
AMA MAINTENANCE FILE INITIALIZED,  
CANNOT CREATE AMA MAINTENANCE FILE,  
SOME AMA MTC RECORDS UNREADABLE, or  
INVALID MESSAGE RECEIVED FROM DISK WRITER,  
take no action for isolated instances. If the problem persists, seek technical assistance.

**NOTE:** Ignore the message, SOME AMA MTC RECORDS UNREADABLE, when it appears after the message, AMA MAINTENANCE FILE INITIALIZED, with AMATPS being run for the very first time.

If variable b = SANITY CHECK FAILURE  
and a tape session was in progress, reestablish the tape session manually using a different tape. The aborted session will not have closed off the tape properly. Seek technical assistance if the problem persists.

SEE PROPRIETARY NOTICE ON COVER PAGE

If variable b = STREAM FILE INITIALIZED,  
set the office-dependent stream value.

If variable b = RECENT CHANGE DISK FILE COULDN'T BE OPENED,  
Seek technical assistance

If variable b = FAILED TO WRITE RC PARAMETERS TO DISK FILE,  
Seek technical assistance

If variable b = OPEN FAILED FOR RC FILE, RECREATING RC FILE,  
Use SET:AMA;RC command to store the correct values.

If variable b = CANNOT CREATE RC FILE,  
Seek technical assistance

If variable b = CANNOT WRITE RC FILE,  
Seek technical assistance

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT AMA SESSIONS ARE MANUALLY INHIBITED FOR a STREAM

## 2. REASON FOR OUTPUT

To indicate that automatic message accounting (AMA) data transfers (teleprocessing or 3B tape writing) have been inhibited for a particular AMA data stream.

## 3. VARIABLE FIELD DEFINITIONS

- a                      IC — Indicates that AMA data transfers have been inhibited for the Inter-LATA revenue accounting office data stream.
- OC — Indicates that AMA data transfers have been inhibited for the operating company revenue accounting office data stream.

## 4. ACTION TO BE TAKEN

To remove the inhibit, and thus allow AMA data transfers, use input message ALW:AMA-SESS.

## 5. REFERENCES

Input Messages  
ALW:AMA-SESS

## 1. FORMAT

- [1] REPT AMA TELEPROCESSING SESSION FOR a STREAM  
b AMA TELEPROCESSING SESSION STATUS  
START TIME c  
d TIME e  
BLOCKS TRANSMITTED f  
PRIMARY POLLS REJECTED g  
SECONDARY POLLS REJECTED h  
[i]
- [2] REPT AMA TELEPROCESSING SESSION FOR a STREAM  
TEMPORARY FILE COULD NOT BE CREATED

## 2. REASON FOR OUTPUT

To report the status of the current or previous automatic message accounting (AMA) teleprocessing session (Format 1). This message prints in response to the OP:AMA-SESSION input message if the teleprocessing option is in effect. Format 2 indicates that the system could not create a temporary file to print the status information.

## 3. VARIABLE FIELD DEFINITIONS

- a IC — Indicates that the information is for the Inter-LATA revenue accounting office data stream.  
OC — Indicates that the information is for the operating company revenue accounting office data stream.
- b CURRENT — Session is in progress at this time.  
PREVIOUS — No session is in progress now.
- c Start time in month, day, hour, minute, and second.
- d CURRENT — Session is in progress at this time.  
STOP — This report is for the previous session.
- e Current time or stop time in month, day, hour, minute, and second.
- f Total number of blocks transmitted.
- g Number of primary file polls that were rejected.
- h Number of secondary file polls that were rejected.

SEE PROPRIETARY NOTICE ON COVER PAGE

- i                      Text phrase indicating the outcome of the previous AMA teleprocessing session. This line only prints if this is the status of the previous session. Possible text phrases are:

NORMAL TERMINATION

ABNORMAL TERMINATION - UNRECOGNIZABLE MESSAGE

ABNORMAL TERMINATION - MESSAGE NOT ALLOWED

ABNORMAL TERMINATION - HIGHER LEVEL ERROR

ABNORMAL TERMINATION - HIGHER LEVEL FAILURE

ABNORMAL TERMINATION - TIMEOUT OR ATTEMPT COUNTER  
REACHED

## 1. FORMAT

REPT AMA/ICDR TRANSFER BUFFER ALARM  
a

## 2. REASON FOR OUTPUT

To report that the automatic message accounting (AMA) and international call detail recording (ICDR) receiving buffer has encountered an alarm situation.

## 3. VARIABLE FIELD DEFINITIONS

a                      BUFFER IS x% FULL  
A minor alarm accompanies this message if the buffer is 25%-74% full.  
A major alarm accompanies this message if the buffer is 75%-94% full.  
A critical alarm is made if the buffer is 95% full or more.

DOWNGRADE 3B BUFFER ALARM TO MAJOR AT x% FULL  
a critical alarm is downgraded to a major alarm if the buffer occupancy has fallen to between 71% and 90% full.

DOWNGRADE 3B BUFFER ALARM TO MINOR AT x% FULL  
A major alarm is downgraded to a minor alarm if the buffer occupancy has fallen to between 21% and 70% full.

RETIRE 3B BUFFER ALARM AT x% FULL  
A minor alarm is retired if the buffer is under 20% full.

## 4. ACTION TO BE TAKEN

For downgrades, no action is necessary. Alarm messages are most often preceded by AMA disk alarms. If so, handle the disk alarm situation. Otherwise, make sure the AMformat, AMdwriteric, and AMdwriteroc are running. If these actions don't work, refer to AMA/ICDR TOPS procedure.

## 5. REFERENCES

TAPE DRIVE NUMBER c  
START TIME d  
e  
START BLOCK f g  
END BLOCK h i  
RECORDS WRITTEN j  
TAPE SEQUENCE NUMBER k  
l
- [2] REPT AMATAPE COMPLETE FOR a STREAM  
TEMPORARY FILE COULD NOT BE CREATED

## 2. REASON FOR OUTPUT

To output the termination of an automatic message accounting (AMA) tape writing session. Format 1 indicates the outcome of the tape writing session. Format 2 indicates that the system could not create a temporary file to print the outcome of the tape writing session.

## 3. VARIABLE FIELD DEFINITIONS

- a IC — Indicates that the information is for the Inter-LATA revenue accounting office data stream.  
OC — Indicates that the information is for the operating company revenue accounting office data stream.
- b Serial number of the tape.
- c Tape drive number.
- d Start time in month, day, hours, minutes, and seconds.
- e Indicates whether primary or secondary data was written to tape.
- f Sequence number of the first block of data written to tape.
- g Time stamp for start block in month, day, hour, and minute.
- h Sequence number of the last block of data written to tape.
- i Time stamp for last block in month, day, hour, and minute.
- j Total number of AMA records written to tape.
- k AMA tape sequence number.

SEE PROPRIETARY NOTICE ON COVER PAGE

l                      Text phrase indicating the outcome of the tape writing session.

#### **4. ACTION TO BE TAKEN**

If a normal termination occurs and more AMA data is to be written to tape; then mount, verify, and write a new tape. If the trailer labels could not be written, refer to AMA TOPS procedures for further resolution. For other reasons of termination, take no action. If Format 2 prints, enter the OP:AMA-SESSION input message to determine the outcome of the tape writing session. Determine the final disposition of the tape based on the text phrase that shows how the tape session was terminated.

- d Year of expiration date.  
xx — Tape header is not in correct format.
- e Day of expiration (1-365).  
xxx — Tape header is not in correct format.
- f Tape drive number.
- g Text phrase that indicates the outcome of the verification process.

## 4. ACTION TO BE TAKEN

If an error has been detected, mount and verify another tape. Also refer to the AMA TOPS procedures for additional actions that may be required. If the automatic message accounting (AMA) tape can be written, manually initiate the writing process using the COPY:AMATAPE input message. If Format 2 prints, reverify the tape before attempting to write AMA data to it.

## 1. FORMAT

- [1] REPT ANALY TLP NULL PACK LIST
- [2] REPT ANALY TLP CANNOT FIND PACK LOCATION a
- [3] REPT ANALY TLP UNABLE TO OPEN TLDB b
- [4] REPT ANALY TLP UNABLE TO READ HEADER FROM DATABASE b
- [5] REPT ANALY TLP ILLEGAL ARGUMENT c
- [6] REPT ANALY TLP CONNSEG FAILED ERRNO d
- [7] REPT ANALY TLP CANNOT OPEN INPUT FILE e
- [8] REPT ANALY TLP CANNOT OPEN DIRECTORY ../datatbl/tlp/misc
- [9] REPT ANALY TLP NO KEYS SET FOR INPUT TO TLP

## 2. REASON FOR OUTPUT

To report error conditions encountered by a Trouble Locating Procedure (TLP).

Format 1 is printed when a search of the Trouble Locating Database (TLDB) found no suspected faulty circuit packs. The fault signature from first failing phase is substantially different from fault signatures in the trouble location database file.

Format 2 is printed when a circuit-pack location cannot be found by the TLP.

Format 3 is printed when the TLP search program cannot open the trouble-locating database file associated with the diagnostic phase that failed.

Format 4 is printed when the trouble-locating database could be opened, but the header information was not there.

Format 5 is printed when the Diagnostic Monitor (DIAMON) passes an illegal argument to TLP.

Format 6 is printed when TLP cannot connect to the diagnostic control block segment.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 is printed when TLP cannot open the file created by the diagnostic control process, which contains the diagnostic fault signatures.

Format 8 is printed when the directory `/diag/datatbl/tlp/misc` cannot be opened. This directory contains the pack location file for each subunit.

Format 9 is printed when a diagnostic failure did not set any TLP keys and consequently sent a null signature to TLP.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                 |
|---|---------------------------------------------------------------------------------------------------------------------------------|
| a | Pack number.                                                                                                                    |
| b | Pathname that specifies the filename of the TLDB.                                                                               |
| c | Illegal argument passed by DIAMON to TLP.                                                                                       |
| d | Error code returned by the operating system call <code>connseg</code> . See the System Error Codes Output Appendix, APP:SYSERR. |
| e | Name of TLP file containing the diagnostic fault signatures.                                                                    |

### 4. ACTION TO BE TAKEN

Retry the request to determine if the condition is repeatable. If it is, perform the actions appropriate for each output message format. If that fails to clear the problem, seek technical assistance.

For Formats 1, 2, 5, 6, and 7, check trouble location process file `/diag/dgnc/tlp`, and restore from backup file system.

Also, for Formats 5, 6, and 7, check diagnostic monitor process file `/diag/dgnc/ppdiamon`, and restore from backup file system.

In addition, for Format 2, check pack location file, and restore from backup file system. Pack location files are in `/diag/datatbl/tlp/misc` and are named `p.unit_number_number`. For example, `p.cu.0_10` and `p.dfc.21_22`.

For Formats 1, 3, and 4, check TLDB file, and restore from backup file system. TLDB files are in directory `/diag/datatbl/tlp/unit[c|e|s|v|x]` and are named `unitphase.db`. For example: `/diag/databl/tlp/dmac/dca10.db` (see the `unit/subunit` UCB mv value and the `tlb` lines in the `/diag/util/cu|pu/unit` file for the TLDB directory).

For Formats 1 and 9, check the diagnostic data table file and offline main store file; if these are missing or corrupted, restore them from backup file system. Data table files are in directories under `/diag/datatbl` (see the `unit/subunit` UCB mv value and the `dgn` lines in the `unit/subunit` util file under `/diag/util` for the `dpt` file name, then the `dpt` file under `/diag/dtp` for the data table file names). Offline main store files are in directories under `/diag/offcode/mas` (see `excofl` statements in the diagnostic listing file to identify the offline main store files - executed).

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 8, verify that the directory and files exist and have correct permissions.  
Restore directory and files from backup file system, if necessary.

APDRV TIMED OUT zz FMI JOBS

```

## 2. REASON FOR OUTPUT

To report the timing out of File Manager Interface (FMI) buffers by the Attached Processor Driver (APDRV) process. The total number of timed out buffers is reported, but only the first five FMI buffers are printed. All data dumps will be in hexadecimal format.

## 3. VARIABLE FIELD DEFINITIONS

- a Attached Processor System (APS) link ID of originating client.
- b System real time clock.
- c Size, in words, or ap\_data field.
- d The ap\_ident field of 1B client.
- e The ap\_options field of Attached Processor (AP) message.
- f Direct Memory Access (DMA) job number for remote 1B client.
- g DMA job number for local FMI client.
- h The ap\_nwds field of AP message.
- i Present status of FMI buffer:
  - X'00 FMI buffer is idle.
  - X'01 1B file write job.
  - X'02 1B file non-write job.
  - X'03 3B file job.
  - X'04 1B job has been canceled.
  - X'05 1B write job has been canceled.
  - X'06 Job (any type) has been canceled.

hhhhhhh hhhhhhhh hhhhhhhh hhhhhhhh hhhhhhhh hhiijjkk llmnnnoo ppqrr00

## 2. REASON FOR OUTPUT

To report the timing out of a Cache Control Block (CCB) by the Attached Processor Driver (APDRV). When this structure times out, all File Manager Interface (FMI) jobs associated with this CCB will be rejected indicating that they were timed out. Data dumps associated with this message will be in hexadecimal format.

## 3. VARIABLE FIELD DEFINITIONS

- a System real time clock.
- b 3B computer memory address of cache buffer.
- c Index into APDRV Direct Memory Access Controller (DMAC) table.
- d Segment ID.
- e Index into seglist.
- f 1B disk address in cache (starting block).
- g CCB state:  
X'28 — BUSY (this should be value in CCB).  
X'32 — AVAILABLE.  
X'1e — FREE.
- h Write in progress flags. For each block in the cache buffer, these flags indicate the state of a Direct Memory Access (DMA) of the block into the cache buffer (DMA write):  
X'00 — No writes into this CCB for this block (idle).  
X'01 — Disk write pending.  
X'02 — DMA pending.
- i Read in progress flag. Set implies that a read from disk into this CCB is pending.
- j Index of CCB waiting for this CCB's current task to complete.

## 1. FORMAT

REPT: APDRV ERR aaa RTC b

## 2. REASON FOR OUTPUT

To report an Attached Processor Driver (APDRV), Attached Processor Message Handler (APMH) or File Manager Interface (FMI) related software or hardware error condition. This error report indicates an error condition which could result in a unit out of service.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code (see Table A).
- b System real time clock at the moment the error occurred.

## 4. ACTION TO BE TAKEN

Repair and restore to service any units that are removed.
