APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

REPT: APDRV FAULT CODE a [VIRT ADDR b] RTC: c

## 2. REASON FOR OUTPUT

To report a fault in the attached processor driver (APDRV). A fault indicates an error condition which could result in a unit out of service.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                      |
|---|--------------------------------------------------------------------------------------|
| a | Fault code (see Table A).                                                            |
| b | Virtual address within APDRV where fault occurred, if APDRV was running at the time. |
| c | The system real time clock when APDRV received the fault.                            |

## 4. ACTION TO BE TAKEN

Repair and restore to service any units that are removed.

TABLE A  
FAULT CODES RECOGNIZED BY APDRV

| Code | Symbol        | Description                                                               |
|------|---------------|---------------------------------------------------------------------------|
| 0x00 | NOFLT         | No fault.                                                                 |
| 0xb1 | FLT_DREP      | Peripheral interface controller (PIC) blamed - with programmed I/O (PIO). |
| 0xb2 | FLT_PICP      | PIC blamed - with PIO.                                                    |
| 0xb3 | FLT_CCP       | System recovery - PIC not blamed, with PIO.                               |
| 0xb4 | FLT_DRED      | PIC blamed.                                                               |
| 0xb5 | FLT_ADRD      | PIC blamed.                                                               |
| 0xb6 | FLT_PICD      | PIC blamed - with direct memory access (DMA).                             |
| 0xb7 | FLT_CCD       | System recovery - PIC not blamed.                                         |
| 0xb8 | FLT_NDREP     | Device reported error - PIO.                                              |
| 0xb9 | FLT_NPICP     | PIC blamed - with PIO.                                                    |
| 0xba | FLT_NADRP     | Addressing error - PIO in progress.                                       |
| 0xbc | FLT_QMSAUD    | Message buffer audit for queued error messages.                           |
| 0xbd | FLT_NONQMSAUD | Message buffer audit for non-queued error messages.                       |
| 0xc4 | FLT_CMA       | Remove unit - excessive errors.                                           |
| 0xc5 | FLT_CMB       | Try to bring up OOS, usable unit.                                         |
| 0xc6 | FLT_CMC       | Try to bring up OOS, not usable unit.                                     |
| 0xc7 | FLT_CMD       | Limp along - no replacement available.                                    |
| 0xc8 | FLT_CMAN      | Remove unit manual request.                                               |
| 0xc9 | FLT_UCLRMV    | Unconditional remove.                                                     |
| 0xcb | FLT_SOFTSW    | Routine soft switch - PCPEIH only.                                        |
| 0xd1 | FLT_PINV      | Memory management - page invalid or not in memory.                        |
| 0xd2 | FLT_PIND      | Memory management - page index too large.                                 |
| 0xd3 | FLT_SINV      | Memory management - segment invalid.                                      |
| 0xd4 | FLT_SIND      | Memory management - segment index too large.                              |
| 0xd5 | FLT_BADOST    | Illegal operating system trap (OST).                                      |
| 0xd6 | FLT_PROT      | Protection violation.                                                     |
| 0xd7 | FLT_ADDR      | Byte of half word addressing violation.                                   |
| 0xd8 | FLT_PRIV      | Instruction privilege violation.                                          |
| 0xd9 | FLT_OPCD      | Illegal op code.                                                          |
| 0xda | FLT_STACK     | Illegal switch between kernel or private stack.                           |
| 0xe0 | FLT_PHASE0    | Phase level 0 initialization.                                             |
| 0xe1 | FLT_SINIT     | System initialization (possible CU switch).                               |
| 0xe2 | FLT_SCRIT     | Critical system initialization.                                           |

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

- [1] REPT: APDRV a INITIALIZATION REQUESTED
- [2] REPT: APDRV INITIALIZATION - APDRV WAS DOWN b MSEC

## 2. REASON FOR OUTPUT

1. To report that a request to initialize the Attached Processor Driver (APDRV) process has been received. This message will be preceded by a REPT:APDRV-FAU CODE X'70 output message and will be succeeded by a REPT: API x ERR X'1a0 and REPT: API x ERR X'1a1 message for each API indicating that the APIs were detached (X'1a0) and attached (X'1a1) from/to interrupts. Also, processor recovery messages (PRMs) will follow, indicating that the APDRV process set up for repetitive timer monitoring and completed initialization.
2. Printed on phase 0 and phase 1. Downtime is the interval between the beginning of the phase and the restart entry into the APDRV process.

## 3. VARIABLE FIELD DEFINITIONS

- a Initialization level performed:
  - FPI — Full Process Initialization,
  - APII — API+DATA Initialization, or
  - DATAI — DATA Initialization.
- b APDRV downtime in milliseconds.

## 4. ACTION TO BE TAKEN

ID ..... REPT:APDRV-IPC  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E, 3B-APS  
TYPE ..... Output

## 1. FORMAT

REPT:APDRV IPC 000abbcc dddddddd [000abbcc dddddddd] [000abbcc dddddddd]

## 2. REASON FOR OUTPUT

This message reports IPC interprocessor commands from the 1B to the 3B APDRV process. These commands are used to configure the API, request PS 0 pumps, initialize the com and xcom buffers, report errors to DLNCM, APDRV full process initialization, and 3B20D phases.

The commands are stored in a buffer and metered out during the APDRV one second entries. Up to three commands are reported on each output message. One message is printed during each timed entry until all entries have been printed.

## 3. VARIABLE FIELD DEFINITIONS

- a API member number which received the command.
- b Interprocessor command. (See INTERPROCESSOR COMMANDS table.)
- c Interprocessor data.
- d 3B real time clock value in msec when command arrived.

## 4. ACTION TO BE TAKEN

None.

## 5. REFERENCES

None.

# INTERPROCESSOR COMMANDS

| Symbol     | Hex**<br>Value | Description                                                 |
|------------|----------------|-------------------------------------------------------------|
| NULLCMD    | p0             | Null command                                                |
| IACK       | p1             | Invalid command received                                    |
| SYNC       | p2             | Synchronization command*                                    |
| SACK       | p3             | Sync acknowledgement command*                               |
| CACK       | p4             | Command acknowledgement*                                    |
| INIT_COM   | p5             | Reinitialize all com_buf resources including API. (TABLE A) |
| ACT_COM    | p6             | Initialize API to com_buf                                   |
| INIT_XCOM  | p7             | Reinitialize all xcom_buf resources including API           |
| CONF_API   | p8             | Configure API pair as specified. (TABLE B)                  |
| ERR_RPT    | p9             | APS error has been detected                                 |
| PS0_REQ    | pa             | PS0 pump request. (TABLE C)                                 |
| UPD_REQ    | pb             | Select logical 1B_file (1 = norm, 2 = update). (TABLE D)    |
| SR_REQ     | pc             | Load 1k words of PCR1A into 3B main memory                  |
| BUF_STATE  | pd             | Tell if common buffers are initialized. (TABLE F)           |
| INIT_APDRV | pe             | APDRV Full Process Initialization                           |
| PHASEREQ   | pf             | Request 3B20D computer phase level. (TABLE E)               |

\* SYNC, SACK, and CACK are used for 1B/3B protocol and are never printed.

\*\* p is the processor type indicator. It is 8 for 1B

TABLE A: INIT\_COM cc

| Symbol  | Value | Description                                |
|---------|-------|--------------------------------------------|
| COMALL  | 00    | Initialize all COM buffers                 |
| CNIALl  | 01    | Initialize all CNI buffers                 |
| COMCNI  | 02    | Initialize all COM and all CNI buffers     |
| COMCNII | 03    | Initialize the COM and incoming CNI buffer |
| COMCNIO | 04    | Initialize the COM and outgoing CNI buffer |
| CNIIN   | 05    | Initialize the incoming CNI buffer         |
| CNIOU   | 06    | Initialize the outgoing CNI buffer         |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE B: CONF\_API cc

For the CONF\_API command the two hexadecimal Interprocessor digits (cc) are two separate four bit items, state and mem (ssssmmmm). State is the new configuration state and mem is the api to configure (0 or 1) to that state.

| Symbol | Hex*<br>Value | Description                      |
|--------|---------------|----------------------------------|
| NOACT  | 0p            | No action                        |
| ACT    | 1p            | Configure api 'p' Active         |
| SBY    | 2p            | Configure api 'p' Standby        |
| OOS    | 3p            | Configure api 'p' Out Of Service |
| UNQ    | 4p            | Configure api 'p' Unequipped     |

\* p (0/1), is the api to configure.

TABLE C: PS0\_REQ cc (Pump Request)

| Action          | Quadrant |
|-----------------|----------|
| Pump first 16K  | 1        |
| Pump second 16K | 2        |
| Pump third 16K  | 3        |
| Pump fourth 16K | 4        |
| Pump fifth 16K  | 5        |

TABLE D: UPD\_REQ cc

| Symbol | Value | Description        |
|--------|-------|--------------------|
| NORMAL | 1     | Normal file access |
| UPDATE | 2     | Update file access |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE E: PHASEREQ cc

| Value | Description                     |
|-------|---------------------------------|
| 1     | Phase 3B with requested level 1 |
| 2     | Phase 3B with requested level 2 |
| 3     | Phase 3B with requested level 3 |

TABLE F: BUF\_STATE cc

In all cases this command returns the state of the send and receive com buffers i.e., initialized (BUF\_INIT) or not initialized (NO\_BUF\_INIT).

For BUF\_STATE the Interprocessor data (cc) are five different binary items: efgghiii. These items have meaning if the flt\_type item is non-zero. Otherwise they are ignored and just the state of the send and receive com buffers are returned.

| Name     | Item | Num<br>Bits | Comment                                  |
|----------|------|-------------|------------------------------------------|
| str_stp  | e    | 1           | Stop CNI Message Stream. 0 = No, 1 = Yes |
| Buf_Init | f    | 1           | Initialize CNI Buffer. 0 = No, 1 = Yes   |

TABLE F: BUF\_STATE cc (continued)

| Name     | Item | Num<br>Bits | Comment                                                      |
|----------|------|-------------|--------------------------------------------------------------|
| Direct   | g    | 2           | CNI Message direction at the time of the error. See TABLE G. |
| side     | h    | 1           | Side with error. 0 = 3B, 1 = 1B                              |
| flt_type | i    | 3           | See TABLE H.                                                 |

TABLE G: Stream Direction

| Name   | Value | Comment          |
|--------|-------|------------------|
| DIR_NA | 0     | Not applicable   |
| 1AIN   | 1     | Incoming to 1B   |
| Direct | 2     | Outgoing from 1B |
| Both   | 3     | Both Directions  |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE H: Fault Type Table

| Value | Comment                           |
|-------|-----------------------------------|
| 0     | No fault                          |
| 1     | CNI Self Pointer fault            |
| 2     | CNI Unload Pointer fault          |
| 3     | 1B APMH detected bad CNI buffer   |
| 4     | CNI load /end pointer fault       |
| 5     | 1B client detected message error  |
| 6     | 1B APMH detected message error.   |
| 7     | No actions assigned to this value |

#### EXAMPLES

The following is the typical sequence of 1B to 3B interprocessor commands for a Hard-A PC to the Norm file. For a 1B 'p' will be 8.

```

REPT:APDRV PCRV 0001pb01 d80d2187 0001pa02 d80d218f 0001pa03 d80d234b
 api 1 api 1 api 1
 norm file ps0 quad 2 ps0 quad 3

REPT:APDRV PCRV 0001pa04 d80d2477 0001pa05 d80d2585 0001pa01 d80d2693
 api 1 api 1 api 1
 ps0 quad 4 ps0 quad 5 ps0 quad 1

REPT:APDRV PCRV 0001p811 d80d2cb8 0001p700 d80d2cd3 0001p600 d80d32ea
 api 1 api 1 api 1
 configure api init xcom mode init com mode

```

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:APDRV-MEM  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

```
REPT: a APDRV MEMORY DUMP
b c d e f g h i
j k l m n o p q
r s t u v w x y
z a1 b1 c1 d1 e1 f1 g1
h1 i1 i1 i1 i1 i1 j1 j1
```

## 2. REASON FOR OUTPUT

To supplement the report that the active Attached Processor Interface (API) appears to have given the Attached Processor Driver (APDRV) faulty data or the APDRV has detected a software error.

**NOTE:** Variables z, a1 through j1 consist of six hexadecimal digits (24 bits) for 1B/3BAPS, while variables b through y consist of eight hexadecimal digits (32 bits) for 3B/APS.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                                    |
|---|----------------------------------------------------------------------------------------------------|
| a | FULL — All lines will be printed.<br>PARTIAL — Only first line (API status) will be printed.       |
| b | BICCMD — Command to Bus Interface Controller (BIC). (See TABLE B of output message REPT:API-DUMP.) |
| c | BICSTAT — BIC status word.                                                                         |
| d | BICDATA — Data returned from BIC. (See TABLE B of output message REPT:API-DUMP.)                   |
| e | CHANSTAT — API channel status.                                                                     |
| f | APISTAT — API 0 and API 1 status. (See TABLE A.)                                                   |
| g | APIFLAGS — APDRV software flags. (See TABLE A.)                                                    |
| h | FLAGS — Recovery flags. (See REPT:API-DUMP TABLE D.)                                               |
| i | API Trouble Flags. (See TABLE A.)                                                                  |
| j | DMSGPTR — Pointer to diagnostic message.                                                           |
| k | IORWCMD — I/O read or write indicator.                                                             |
| l | RAMADDR — Random Access Memory (RAM) address.                                                      |
| m | DGNADDR — Diagnostic Direct Memory Access (DMA) address.                                           |

SEE PROPRIETARY NOTICE ON COVER PAGE

|    |                                                                           |
|----|---------------------------------------------------------------------------|
| n  | DMASIZE — Size of diagnostic DMA request.                                 |
| o  | IORWSTAT — Status of I/O read or write.                                   |
| p  | CHSTATUS — Dual Serial Channel (DSCH) status.                             |
| q  | WDSAVE0 — Special DMA word for diagnostics.                               |
| r  | WDSAVE — Special DMA word for diagnostics.                                |
| s  | SEGIDPTR — Segment ID of diagnostic process.                              |
| t  | DUCBPTR — Unit Control Block (UCB) record pointer of API being diagnosed. |
| u  | DGNRID — Record ID (RID) of API being diagnosed.                          |
| v  | DGNHND13 — Thirteenth word of diagnostic structure. (See Figure 1.)       |
| w  | DGNPNUM — Process number of diagnostic program.                           |
| x  | DGNHND15 — Fifteenth word of diagnostic structure. (See Figure 1.)        |
| y  | DGNSPARE — Unused space in diagnostic structure.                          |
| z  | APMSG1 — First word of APS message. (See Figure 1.)                       |
| a1 | APMSG2 — Second word of APS message. (See Figure 1.)                      |
| b1 | APIDENT — ID information used only by client.                             |
| c1 | APSPARE — Spare message word reserved for future growth.                  |
| d1 | APCKSUM — Code to verify message contents.                                |
| e1 | APMSG6 — Sixth word of the APS message. (See Figure 1.)                   |
| f1 | APNWDS — Number of words to be transferred for DMA operations.            |
| g1 | APADR — Address information of DMA type transfer operation.               |
| h1 | APETIME — Starting time used to calculate elapsed time of DMA job.        |
| i1 | APSPARE — Spare message word reserved for future growth.                  |
| j1 | APDATA — Data field containing message body. (See Table B.)               |

Table A (cont'd)  
APDRV DATA WORD LAYOUTS

API Trouble Flags Layout: aaaabbbb

a = API 0 Trouble Flags.  
b = API 1 Trouble Flags.

Flags =

0x0001 = Detached from interrupts  
0x0002 = This API is babbling  
0x0010 = Unable to form link to 1B  
          through this API  
0x0100 = API Status error found

SEE PROPRIETARY NOTICE ON COVER PAGE

Table B  
APS MESSAGE BODY LAYOUTS  
for messages with AP\_TYPE = MSG  
MSG\_ACK  
API\_MSG  
API\_MSG\_ACK

COMBUF

Define the send and receive common buffers size and location to the API.

Used by: Attached processor message handler (APMH)  
and attached processor driver (APDRV)

Buffer used: Maintenance buffer

msg\_type = \_COMBUF = 0x001  
data[1] = Send common buffer address.  
data[2] = Receive common buffer address.  
data[3] = Common buffer size in words.

XCOMBUF

Define the send and receive xcommon buffers size and location for the API. To the API, this message appears the same as the COMBUF message.

Used by: APMH and APDRV  
Buffer used: Maintenance buffer

msg\_type = \_XCOMBUF = \_COMBUF  
data[1] = Send extra common buffer address.  
data[2] = Receive extra common buffer address.  
data[3] = Extra common buffer size in words.

JOBBUFC

Define the common job buffer location, size, and number to the API.

Used by: APMH and APDRV  
Buffer used: Maintenance buffer

msg\_type = \_JOBBUFC = 0x002  
data[1] = Job buffer start address.  
data[2] = Maximum number of job buffers.  
data[3] = Size of each buffer.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table B (cont'd)  
APS MESSAGE BODY LAYOUTS

JOBBUF

Define the maintenance job buffer location, size, and number to the API.

Used by: APMH and APDRV  
Buffer used: Maintenance buffer

msg\_type = \_JOBBUF = 0x003  
data[1] = Job buffer start address.  
data[2] = Maximum number of job buffer.  
data[3] = Size of each buffer.

PCPUMP

Request to pump PS0 data (one-sided DMA).

Used by: APDRV  
Buffer used: Maintenance buffer

msg\_type = \_PCPUMP = 0x004  
data[1] = 1B address of process recovery  
program pump (PCRVPUMP).  
data[2] = 3B address of PCRVPUMP.  
data[3] = Number of words to DMA.  
data[4] = PC complete flag option.  
  
option = NPCCPLT = 0x000  
PCCPLT = 0x001

DMADGN

Diagnostic request for DMA read or write of PIC RAM.

Used by: APDRV  
Buffer used: Maintenance buffer

msg\_type = \_DMADGN = 0x005  
data[1] = READ = 0x005  
= WRITE = 0x006  
data[2] = 3B address.  
data[3] = RAM address.  
data[4] = Size.

SEE PROPRIETARY NOTICE ON COVER PAGE

Table B (cont'd)  
APS MESSAGE BODY LAYOUTS

DGNINST

Diagnostic instruction to PIC.

Used by: APDRV

Buffer used: Maintenance buffer

msg\_type = \_DGNINST = 0x006

DGNCNTL

Diagnostic message used to control 3B diagnostic activity.

START1A causes any in-progress API diagnostic to be aborted. A 3B block diagnostic flag is set which prevents diagnostics from being originated from the 3B side.

STOP1A causes any in-progress API diagnostic to be aborted. The 3B block diagnostic flag is reset, thus allowing diagnostics to be originated from the 3B side.

Used by: APFR,1B diagnostic program

Buffer used: Common buffer

|          |           |         |
|----------|-----------|---------|
| msg_type | = DGNCNTL | = 0x006 |
| data[1]  | = API 0   | = 0x000 |
|          | = API 1   | = 0x001 |
| data[2]  | = START1A | = 0x001 |
|          | = STOP1A  | = 0x002 |

TESTMSG

Test message used to verify link communication.

Used by: APMH and APDRV

Buffer Used: Common buffer

msg\_type = TESTMSG = 0x007

SEE PROPRIETARY NOTICE ON COVER PAGE

Table B (cont'd)  
APS MESSAGE BODY LAYOUTS

APISTAT

Define the 1B API status to 3B.

Used by: APMH

Buffer used: Common buffer

|          |             |         |
|----------|-------------|---------|
| msg_type | = APISTAT   | = 0x008 |
| data[1]  | = API0 stat |         |
| data[2]  | = API1 stat |         |
| stat     | = NOACT     | = 0x000 |
|          | ACT         | = 0x001 |
|          | SBY         | = 0x002 |
|          | OOS         | = 0x003 |
|          | UNQ         | = 0x004 |

PHASE DATA  
T=ccc A=ddd S=eee I=ff

## 2. REASON FOR OUTPUT

Format 1 is used to report an Attached Processor System (APS) driver error encountered by the Attached Processor Interface (API) diagnostic program.

Format 2 is used to report an error encountered by the API diagnostic programs.

Format 3 is used to report a LEXEC (off-line code execution) function failure encountered by the API diagnostic program.

## 3. VARIABLE FIELD DEFINITIONS

- a Reason for audit:
- 41 — Open special device file failed.
  - 42 — Set Input/Output (SETIO) failed.
  - 43 — MAKESEG (make a segment of memory) function call failed.
  - 44 — SENDPW (send a message to a port and wait for reply) function call failed.
  - 46 — Driver operation failed.
  - 48 — MSGENAB (enable message reception) function call failed.
  - 49 — MSGDISAB (disable message reception) function call failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 4A — Open PCPMD (control unit maintenance driver) failed.
  - 4B — Write to PCPMD failed.
  - 4C — Execute Off-Line (EXCOFL) timed out.
  - 4D — Open Equipment Configuration Database (ECD) manager failed.
  - 4E — Unit control block number function failed.
  - 4F — Peripheral Interface Controller (PIC) micro store size not in Unit Control Block (UCB).
  - 50 — Receive wait failed.
  - 51 — LEXEC (off-line code execution) function failed.
  - 64 — Cannot open data table file.
  - 65 — Cannot share Diagnostic Control Block (DCB) from Diagnostic Monitor (DIAMON).
  - 66 — Error in the data table.
  - 67 — Invalid number of parameters from DIAMON.
  - 68 — Open spooler failed.
  - 6A — Invalid interactive mode command.
  - 6C — Open Trouble Locating Procedure (TLP) file failed.
  - 6D — Illegal instruction signal.
  - 6E — Bus error signal.
  - 6F — Segment violation signal.
  - 70 — Software termination signal.
- b APS driver error code. Refer to the DIAGNOSTIC ERRORS section of Table A in REPT:APDRV-ERR for any other APS driver error codes. Values:
- 1 — Request by 1B to abort diagnostic.
  - 2 — Link integrity monitor test fault.
  - 3 — API being restored.
- c Last test executed.
- d Data table address.
- e Data table statement number.
- f Task routine index.
- g Error number value returned on a failing system call or ECD function call.
- h Error code returned by LEXEC function call.
- i Error code from a PCPMD (the control unit (CU) maintenance driver) function call.

#### 4. ACTION TO BE TAKEN

Correct the error that caused the audit.

[API RAM DUMP UNAVAILABLE]

```

## 2. REASON FOR OUTPUT

To supplement data for a report that an API has detected an error.

Variables c through a5 are data dump information.

Variables c through h are selected hardware related data from the Attached Processor Driver (APDRV).

Variables i through p4 are the dump of the PIC RAM from the API that detected the error.

Variables q4 through a5 are the contents of the last message processed by the API.

## 3. VARIABLE FIELD DEFINITIONS

- a                      FULL     — All applicable lines will be printed.  
                        Partial — Only the first line (API status) will be printed.
- b                      Member number of the API that detected the error.
- c                      BICCMD - Command to Bus Interface Controller (BIC). (See Table B).
- d                      BICDATA - Data returned from BIC (See Table B).

| l  | Send COM/XCOM unload pointer.                                                    |
| m  | Receive COM/XCOM virtual offset.                                                 |
| n  | Receive COM/XCOM size.                                                           |
| o  | Receive COM/XCOM load pointer.                                                   |
| p  | Receive COM/XCOM unload pointer.                                                 |
| q  | Send job buffer state vector and number of words.                                |
| r  | Send job buffer DMA address.                                                     |
| s  | Send job buffer client information.                                              |
| t  | Send job buffer from, time and number.                                           |
| u  | Send auditing timing information.                                                |
| v  | Spare.                                                                           |
| w  | Spare.                                                                           |
| x  | Send job buffer checksum.                                                        |
| y  | Receive job buffer state vector and number of words.                             |
| z  | Receive job buffer DMA address.                                                  |
| a1 | Receive job buffer client information.                                           |
| b1 | Receive job buffer from, time, and number.                                       |
| c1 | Receive auditing timing information.                                             |
| d1 | Spare.                                                                           |
| e1 | Spare.                                                                           |
| f1 | Receive job buffer checksum.                                                     |
| g1 | PIC status register.                                                             |
| h1 | Error Status register.                                                           |
| i1 | Send Mtce Buffer virtual address for 3B.                                         |
| j1 | Receive Mtce Buffer virtual address for 3B.                                      |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE A  
PIC WORD LAYOUTS

PIC STATUS (PICSTAT) WORD LAYOUT

| Bit | Description                                                                                                               |
|-----|---------------------------------------------------------------------------------------------------------------------------|
| 00  | Open.                                                                                                                     |
| 01  | Interrupt generated by a 1B alert.                                                                                        |
| 02  | Interrupt generated by a 3B alert.                                                                                        |
| 03  | Interrupt generated by a 3B SINT<br>(interrupt to initiate high priority<br>interprocessor maintenance message protocol). |
| 04  | 1B alert function disabled.                                                                                               |
| 05  | 3B alert function disabled.                                                                                               |
| 06  | 1B error checking disabled.                                                                                               |
| 07  | 3B error checking disabled.                                                                                               |
| 08  | 1B side API in loop around mode.                                                                                          |
| 09  | 3B side API in loop around mode.                                                                                          |
| 10  | DMA suspended by 1B.                                                                                                      |
| 11  | DMA suspended by 3B computer.                                                                                             |
| 12  | Interrupt generated by a peripheral<br>interface controller (PIC) error.                                                  |
| 13  | Interrupt generated by a PC.                                                                                              |
| 14  | Interrupt generated by a 1B SINT.                                                                                         |
| 15  | Interrupt generated by diagnostics.                                                                                       |

PIC ERROR (ERRSTAT) WORD LAYOUT

| Bit | Description                                  |
|-----|----------------------------------------------|
| 00  | Bus interface controller (BIC) timeout.      |
| 01  | Actual read in offset or size error.         |
| 02  | 1B command register inhibited.               |
| 03  | Auxiliary unit (AU) bus sequencer inhibited. |
| 04  | AU address range error.                      |
| 05  | Parity failure on AP bus.                    |
| 06  | Parity failure on PIC bus.                   |
| 07  | Pointer check failure.                       |
| 08  | Command check error.                         |
| 09  | Maintenance buffer address not loaded.       |
| 10  | Illegal PIC RAM address specified.           |
| 11  | PIC error.                                   |
| 12  | BIC error.                                   |
| 13  | DMA word count error.                        |
| 14  | Illegal circular buffer command.             |
| 15  | Illegal instruction.                         |

TABLE B  
BIC AND PIC COMMANDS

APS INTERPROCESSOR LINK COMMANDS  
(BICDATA and upper 16 bits of BICCMD)

| Symbol    | Code   | Description                                 |
|-----------|--------|---------------------------------------------|
| NULLCMD   | 0x00   | Null command.                               |
| IACK      | 0x01   | Invalid command received.                   |
| SYNC      | 0x02   | Synchronization command.                    |
| SACK      | 0x03   | Sync acknowledgment command.                |
| CACK      | 0x04   | Command acknowledgment.                     |
| INIT_COM  | 0x05   | Initialize to com_buf resources.            |
| ACT_COM   | 0x06   | Initialize API to com_buf.                  |
| INIT_XCOM | 0x07   | Initialize to xcom_buf resources.           |
| CONF_API  | 0x08   | Configure API pair as specified.            |
| ERR_RPT   | 0x09   | APS error has been detected.                |
| PS0_REQ   | 0x0a   | PSO pump request as specified.              |
| UPD_REQ   | 0x0b   | Select logical 1B_file for normal requests. |
| SR_REQ    | 0x0c   | Load 1k words of PCRVUMP to 3B main memory. |
| BUF_STATE | 0x0d   | Tell if common buffers are initialized.     |
| VERFYLINK | 0xd34d | Verify APS link is operational.             |
| REQCONF   | 0xd555 | Request API configuration from 1B.          |

BIC COMMANDS (BICCMD)

| Symbol     | Code        | Description                                                     |
|------------|-------------|-----------------------------------------------------------------|
| BIC_CF     | 0x80000000L | BIC command present flag.                                       |
| BIC_TM     | 0x04000000L | BIC data transfer mode.                                         |
| BIC_CIP    | 0x40000000L | BIC command in progress flag.                                   |
| BIC_DF     | 0x20000000L | BIC data flag.                                                  |
| BIC_DAD    | 0x60000000L | BIC data fifo access denied<br>(BIC_DF AND BIC_CIP).            |
| BIC_INTP   | 0x00200000L | BIC interrupt.                                                  |
| PIC_RESET  | 0x00004000L | Reset the PIC.                                                  |
| BIC_CLR    | 0x00002000L | Clear the BIC.                                                  |
| BIC_CFIFO  | 0x00001000L | Clear BIC FIFO.                                                 |
| BIC_IFEN   | 0x00000800L | BIC-PIC interface enable.                                       |
| BIC_SWDM   | 0x00000200L | Set word mode.                                                  |
| BIC_RSINT  | 0x00000100L | Reset BIC interrupt.                                            |
| BIC_PIC_ER | 0x0000fff0L | BIC-PIC error mask.                                             |
| PICINIT    | 0x00007200L | Initialize PIC (PIC_RESET, BIC_CLR,<br>BIC_CFIFO and BIC_SWDM). |
| DBS_CLR    | 0x00000001L | Clear DDSBS.                                                    |
| DBS_NORM   | 0x0000000bL | Set DDSBS to normal mode.                                       |

PIC COMMANDS  
(Lower 16 bits of BICCMD)

| Symbol  | Code   | Description                               |
|---------|--------|-------------------------------------------|
| MBSIZE  | 0x0106 | api mtc_buf size opcode.                  |
| INVALID | 0x0006 | api invalid opcode.                       |
| SMBADD  | 0x0206 | api send mtc_buf address opcode.          |
| DRVSEG  | 0x0306 | expanded DMA index for APDRV segment.     |
| RMBADD  | 0x0406 | api receive mtc_buf address opcode.       |
| LRAM    | 0x0606 | api load ram from mtc_buf opcode.         |
| DRAM    | 0x0706 | api dump ram to mtc_buf opcode.           |
| SMB     | 0x0806 | api send mtc_buf to 1B opcode.            |
| SMUP    | 0x0906 | api send mtc unload pointer to 1B opcode. |
| SINT    | 0x0a06 | api send MI to 1B opcode.                 |
| SHPIINT | 0x0b06 | api send high priority interrupt opcode.  |
| SDMA    | 0x0c06 | api suspend DMA opcode.                   |
| RDMA    | 0x0d06 | api resume DMA opcode.                    |
| RJOBNUM | 0x0e06 | api read DMA job numbers opcode.          |
| ABTDMA  | 0x0f06 | api abort DMA job in progress opcode.     |
| DLOOP   | 0x1006 | api disable PIC loop around mode opcode.  |
| ELOOP   | 0x1106 | api enable PIC loop around mode opcode.   |
| DERRCHK | 0x1206 | api disable error checks opcode.          |
| EERRCHK | 0x1306 | api enable error checks opcode.           |
| GETPICS | 0x1406 | api get PIC status word opcode.           |
| CLRPICS | 0x1506 | api clear PIC status word opcode.         |
| GETPICE | 0x1606 | api get PIC error word opcode.            |
| CLRPICE | 0x1706 | api clear PIC error word opcode.          |
| RSTATE  | 0x1806 | api read API state.                       |
| WSTATE  | 0x1906 | api write API state.                      |
| DALERT  | 0x1c06 | api disable alert function for "my" side. |
| EALERT  | 0x1d06 | api enable alert function for "my" side.  |
| WDATA   | 0x1e06 | api write data opcode.                    |
| RDATA   | 0x1f06 | api read data opcode.                     |

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

REPT: API a ERR bbb RTC: c

## 2. REASON FOR OUTPUT

To report an error detected by the attached processor driver (APDRV) which is directed to the attached processor interface (API), including possible software errors detected by the API. This error report indicates an error condition which could result in a unit out of service.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number of the API that caused or detected the error.
- b Error code (see Table A).
- c System real time clock at the moment the error occurred.

## 4. ACTION TO BE TAKEN

Repair and restore to service any units that are removed.

## 5. REFERENCES

ID ..... REPT:APLUPD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

- [1] REPT: APLUPD FAILED TO OPEN TO ECD
- [2] REPT: APLUPD FAILED TO OPEN ECD SEQUENCE
- [3] REPT: APLUPD PORT CONNECT FAILURE
- [4] REPT: APLUPD FAILED TO a 1A FILE
- [5] REPT: APLUPD UNKNOWN TYPE OF b MESSAGE QUERY TYPE c

## 2. REASON FOR OUTPUT

To report a failure to access the Equipment Configuration Database (ECD) by the Attached Processor Lamp Update (APLUPD) process.

Format 1 is printed when APLUPD cannot "open" to the ECD / dev / ecd file.

Format 2 is printed when APLUPD fails to open the ECD for Unit Control Block (UCB) sequencing.

Format 3 is printed when there is an APLUPD port connect failure.

Format 4 is printed when the APLUPD fails to OPEN or READ the 1B file.

Format 5 is printed when the APLUPD receives unknown messages.

## 3. VARIABLE FIELD DEFINITIONS

- a General source of message:
  - Open — Could not OPEN the 1B file.
  - READ — Could not READ the 1B file.
- b General source of message:
  - INTERPROCESS — Could not determine RTR interprocess message type.
- c RTR message type:
  - APDRV — Could not determine APDRV message type.
  - 1A REQUEST — APLUPD received an unknown data request from the 1B Processor.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For Format 1, check the /dev/ecd file for validity, that is, check that /dev/ecd exists and is writable.

For Format 2, no action is necessary.

APLUPD process, upon detection of one of these errors, will commit suicide after 30 seconds and reattempt ECD access. If errors persist, seek technical assistance.

For Format 3, seek technical assistance.

For Format 4, seek technical assistance.

For Format 5, seek technical assistance.

#### **5. REFERENCES**

None.

## 2. REASON FOR OUTPUT

Prints errors in connection with the Database Administration (DA) for application databases.

## 3. VARIABLE FIELD DEFINITIONS

- a                      String representing the DA object that encountered the error:
- MT     — Controls application of database changes to the 3B disk.
  - SK0    — Single key operation.
  - SLT    — Controls application of database changes to the DLNs.
  - SPLT   — Controls changing database after an NPA Split.
  - TR     — Master controller for RC/V transactions.

SEE PROPRIETARY NOTICE ON COVER PAGE

b

Error code indicating what the error was:

- 650 — TR object is stuck in loop constantly deleting the same instance.
- 651 — Data from RC:MISC too large for buffer.
- 652 — Did not read the expected amount of data from tmp file.
- 653 — Database does not exist.
- 654 — Could not create TR instance.
- 655 — Failure in populating MT and SKO instances.
- 656 — Failure to encode ASN message.
- 657 — No SLT instance exists.
- 658 — Customer Database out of range.
- 659 — DLNCM indicates an error trying to write to DLNs.
- 660 — Could not create SLT instance.
- 661 — Invalid File Descriptor for DS.
- 662 — Invalid Choice of SKO.
- 663 — An expected SKO does not exist.
- 664 — Could not create SKO instance.
- 665 — MT object is stuck in loop constantly deleting the same instance.
- 666 — SKO instance in incorrect state.
- 667 — DS File did not close.
- 668 — Could not create MT instance.
- 669 — An expected MT instance does not exist.
- 670 — Could not create LOG instance.
- 671 — Could not create SPLT instance.
- 672 — Failure in populating SPLT instance.
- 673 — An expected MT instance does not exist.
- 674 — An expected ONEA instance does not exist.
- 675 — Could not create ONEA instance.
- 676 — Waiting too long for FR to recalc CRCs.

c

Supplementary error code:

- 1-99 — UNIX RTR System error, see output Appendix APP:SYSERR.
- 101 — General database failure, unsuccessful completion.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 105 — Item to be modified was not located.
- 110 — Cannot add number, hash table full.
- 111 — Cannot add number, 10-digit compaction table full.
- 116 — Cannot add point code sub-system information, NCP table full.
- 120 — Cannot add record, it already exists.
- 123 — The dialed digit/ANI being searched for was not found.
- 124 — Specified NPA-NXX combination was not found.
- 127 — Associated point code sub-system information does not exist.
- 141 — File descriptor is out of range.
- 143 — Error on reading from the database.
- 144 — Error on writing to the database.
- 154 — Database inconsistencies have been detected.
- 155 — Cache inconsistencies have been detected.
- 156 — The ADMINTOC or DBTOC magic number is invalid.
- 157 — Invalid database type for this application.
- 160 — Clump number is out of range for application.
- 176 — All file descriptors are active, none available.
- 180 — The replacement NPA-NXX value already exists.
- 190 — The application database value is invalid.
- 191 — The specified user identification number is invalid.
- 192 — The specified access mode is invalid.
- 193 — The specified customer identification number is invalid.
- 194 — The compaction table search chain exceeded maximum length.
- 195 — The dialed digit/ANI table search chain exceeded maximum.
- 196 — The DLN user buffer address is invalid.
- 201 — The argument 'object' is invalid.
- 202 — The argument passed in is invalid.
- 203 — The instance does not exist.
- 204 — The instance cannot be created, it exists already.
- 205 — End of object array, no more instances.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 206 — No free IR internal buffer.
- 207 — Request IMS buffer failed.
- 208 — Build IMS header failed.
- 209 — IMS write failed.
- 212 — Data size + number of key > 480 bytes.
- 213 — Domain exceeds its buffer quota.
- 215 — Argument 'domain' is invalid.
- 216 — Get\_BAD\_CHAN failure from IMS read.
- 217 — Get\_RTNMSG failure from IMS read.
- 218 — Get\_SRCMATCH failure from IMS read.
- 219 — Bad message type.
- 220 — IR event length > 508 bytes.
- 223 — Wrong queue type.
- d Name of temporary file that cannot be opened.
- e Unix error code as a string.

#### 4. ACTION TO BE TAKEN

If repeated errors indicate problems, seek technical assistance. The utility command, irutil, may be useful in providing further information in tracking down a problem reported by the REPT:APPDB-DA output message. This command resides in /tools/irutil and has a usage statement that demonstrates how to use the command.

## 2. REASON FOR OUTPUT

Prints errors in connection with the fault recovery system for the application databases.

## 3. VARIABLE FIELD DEFINITIONS

- a Application database that is affected. Valid values are:
  - IBGTT — Inbound global title translation
  - OBGTT — Outbound global title translation
  - PCPGTT — Positive call processing global title translation
- b The number of the clump of data that is affected. Valid values are 0 - 1280.
- c The calculated CRC value for a clump. This is a hexadecimal value.
- d The stored CRC value for a clump. This is a hexadecimal value.
- e Error code indicating why the audit could not get information about devices. Possible values are:
  - 1 — Unable to get the information requested.
  - 1 — Retry later.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f Error code indicating a problem interfacing to the application database:
- 601 — Unable to get a filename for the master database.
  - 602 — Unable to attach to the database.
  - 603 — File descriptor is bad.
  - 604 — Unable to get next clump number.
  - 605 — Unable to get a clump of data.
  - 606 — Unable to determine the size of a clump.
  - 607 — Unable to determine the number of clumps.
  - 608 — Unable to determine the total number of clumps.
  - 609 — Unable to get CRC data.
  - 610 — Unable to access the DLN from the 3B20D.
  - 611 — Unable to get the device name of a DLN.
  - 612 — Unable to get the update information after a Recent Change.
  - 613 — Unable to get the master database file name.
  - 614 — Unable to write the CRC data.
  - 615 — Application database number is invalid.
- g Group number of a Direct Link Node. Possible values are 00 or 32.
- h Error code indicating a problem with attaching or using the application database.
- 1-99 — UNIX RTR System error, see output Appendix APP:SYSERR.
  - 101 — General database failure, unsuccessful completion.
  - 105 — Item to be modified was not located.
  - 110 — Cannot add number, hash table full.
  - 111 — Cannot add number, 10-digit compaction table full.
  - 116 — Cannot add point code sub-system information, NCP table full.
  - 120 — Cannot add record, it already exists.
  - 123 — The dialed digit/ANI being searched for was not found.
  - 124 — Specified NPA-NXX combination was not found.
  - 127 — Associated point code sub-system information does not exist.
  - 141 — File descriptor is out of range.
  - 143 — Error on reading from the database.
  - 144 — Error on writing to the database.
  - 154 — Database inconsistencies have been detected.
  - 155 — Cache inconsistencies have been detected.
  - 156 — The ADMINTOC or DBTOC magic number is invalid.
  - 157 — Invalid database type for this application.
  - 160 — Clump number is out of range for application.
  - 176 — All file descriptors are active, none available.
  - 180 — The replacement NPA-NXX value already exists.
  - 190 — The application database value is invalid.
  - 191 — The specified user identification number is invalid.
  - 192 — The specified access mode is invalid.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 193 — The specified customer identification number is invalid.
  - 194 — The compaction table search chain exceeded maximum length.
  - 195 — The dialed digit/ANI table search chain exceeded maximum.
  - 196 — The DLN user buffer address is invalid.
- i                      Error code indicating why an audit object was not able to be created.
- 201 — The argument 'object' is invalid.
  - 202 — A parameter is invalid.
  - 203 — The instance does not exist.
  - 204 — The instance cannot be created, it exists already.
  - 205 — End of object array, no more instances.
  - 206 — No free IR internal buffer.
  - 207 — Request IMS buffer failed.
  - 208 — Build IMS header failed.
  - 209 — IMS write failed.
  - 212 — Data size + number of key > 480 bytes.
  - 213 — Domain exceeds its buffer quota.
  - 215 — Argument 'domain' is invalid.
  - 216 — Get\_BAD\_CHAN failure from IMS read.
  - 217 — Get\_RTNMSG failure from IMS read.
  - 218 — Get\_SRCMATCH failure from IMS read.
  - 219 — Bad message type.
  - 220 — IR event length > 508 bytes.
  - 223 — Wrong queue type.
- m                      Member number of a Direct Link Node. Possible values are between 0 and 16.
- n                      Any valid filename.
- o                      Represents line number.

#### 4. ACTION TO BE TAKEN

If repeated errors indicate problems, seek technical assistance. The utility command, irutil, may be useful in providing further information in tracking down a problem reported by the REPT:APPDB-FR output message. This command resides in /tools/irutil and has a usage statement that demonstrates how to use the command.

## 2. REASON FOR OUTPUT

Prints errors in connection with the base 3B20D process that provides data administration and fault recovery of the application databases.

## 3. VARIABLE FIELD DEFINITIONS

- a A character string representing the object name.
- b Error code indicating why an object instance cannot be cleared.  
Possible values include:
  - 201 — The argument 'object' is invalid.
  - 202 — The argument passed in is invalid.
  - 203 — The instance does not exist.
  - 204 — The instance cannot be created, it exists already.
  - 205 — End of object array, no more instances.
  - 206 — No free IR internal buffer.
  - 207 — Request IMS buffer failed.
  - 208 — Build IMS header failed.
  - 209 — IMS write failed.
  - 212 — Data size + number of key > 480 bytes.
  - 213 — Domain exceeds its buffer quota.
  - 215 — Argument 'domain' is invalid.
  - 216 — Get\_BAD\_CHAN failure from IMS read.
  - 217 — Get\_RTNMSG failure from IMS read.
  - 218 — Get\_SRCMATCH failure from IMS read.
  - 219 — Bad message type.
  - 220 — IR event length > 508 bytes.
  - 223 — Wrong queue type.
- c Invalid destination object number.
- d A string representing either the fault recovery or the data administration. Possible values are "FR" or "DA".
- e A number representing the identifier for an object instance.
- f The fault code for supervisor fault entry. Refer to output Appendix APP:FAULT-CODE.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                           |
|---|-----------------------------------------------------------------------------------------------------------|
| g | The virtual memory address where the interrupt occurred.                                                  |
| h | Contents of a register when the interrupt occurred. R0 contains the return value of the fault subroutine. |
| i | Location of the stack when the interrupt occurred.                                                        |

## 1. FORMAT

REPT APRMVRST ERROR a b

## 2. REASON FOR OUTPUT

To report an error condition in the attached processor remove/restore (APRMVRST) user process.

## 3. VARIABLE FIELD DEFINITIONS

- a                      The error condition:
- 1 — Message enable function call failure.
  - 2 — Receive wait function call failure.
  - 3 — Cannot open spooler process.
  - 4 — Cannot open equipment configuration data base (ECD) manager.
  - 5 — Cannot get unit control block (UCB) from ECD manager.
  - 6 — UCB not for requested unit.
  - 7 — Cannot open special device file.
  - 8 — SENDW (send a message and wait for reply) function call failure.
  - 9 — Cannot set unit number in UCB.
  - 10 — Cannot set manual restore request in UCB.
  - 11 — SENDPW (send a message to a port and wait for reply) function call failure.
  - 12 — Illegal instruction signal.
  - 13 — Bus error signal.
  - 14 — Segment violation signal.
  - 15 — Software termination signal.
  - 16 — Abort request via manual input.
- b                      The error code returned by the failing function call.

## 4. ACTION TO BE TAKEN

If an operating system function call is failing, obtain technical assistance to clear the trouble.

gggggggg gggggggg gggggggg 00000000 00000000 00000000 00000000 00000000 ]

## 2. REASON FOR OUTPUT

To report an Attached Processor System Message Driver (APSMMSG) error condition. This message could report errors that are a result of losing a DMERT output message sent to the 1B processor.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                       |
|---|---------------------------------------------------------------------------------------|
| a | Error code. (See Table A).                                                            |
| b | Supplementary data word. (See Table A)                                                |
| c | Head of free large message buffer queue.                                              |
| d | Tail of free large message buffer queue.                                              |
| e | Head of active large message buffer queue.                                            |
| f | Tail of active large message buffer queue.                                            |
| g | Next buffer links (1 byte each) for large message buffers 0 through 39, respectively. |

## 4. ACTION TO BE TAKEN

For error codes 0x60n, the APSMSG process will be left in a state such that DMERT output messages will not be sent to the 1B processor. To recover from this condition, 'pkill' the APSMSG process. Otherwise, no action is necessary.

ID ..... REPT:APSMMSG-FAU  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

REPT: APSMSG FAULT CODE X'a [ VIRT ADDR X'b ]

## 2. REASON FOR OUTPUT

To report a fault in the Attached Processor System Message Driver (APSMMSG). A fault indicated an error condition that could result in the loss of DMERT output messages sent to the 1B processor.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Fault code. (See Table A.)
- b                      Virtual address within APSMSG where fault occurred, if APSMSG was running at the time.

## 4. ACTION TO BE TAKEN

No action is necessary.

## 5. REFERENCES

Output Message  
REPT:APSMMSG-ERR

SEE PROPRIETARY NOTICE ON COVER PAGE

**TABLE A**  
**ATTACHED PROCESSOR SYSTEM MESSAGE DRIVER FAULTS HANDLED**

| Code | Symbol | Description |
|------|--------|-------------|
| 0x00 | NOFLT  | No fault.   |

**MESSAGE BUFFER AUDIT FAULTS**

|      |               |                                      |
|------|---------------|--------------------------------------|
| 0xbc | FLT_QMSAUD    | Fault for queued error messages.     |
| 0xbd | FLT_NONQMSAUD | Fault for non-queued error messages. |

**MEMORY MANAGEMENT FAULTS**

|      |          |                                |
|------|----------|--------------------------------|
| 0xd1 | FLT_PINV | Page invalid or not in memory. |
| 0xd2 | FLT_PIND | Page index too large.          |
| 0xd3 | FLT_SINV | Segment invalid.               |
| 0xd4 | FLT_SIND | Segment index too large.       |

ID ..... REPT:ARR-AUTORST  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

This message has nine output formats:

- [1] REPT ARR AUTORST  
ACTIVATED
- [2] REPT ARR AUTORST  
a b FOR c STARTED
- [3] REPT ARR AUTORST  
a b FOR c SUCCEEDED
- [4] REPT ARR AUTORST  
a b FOR c ABORTED
- [5] REPT ARR AUTORST  
a b FOR c FAILED
- [6] REPT ARR AUTORST  
RECOVERY THRESHOLD EXCEEDED FOR c
- [7] REPT ARR AUTORST  
TIMEOUT AWAITING MIRA FOR c
- [8] REPT ARR AUTORST  
a b FOR c STOPPED <INHIBITED>
- [9] REPT ARR AUTORST  
ACNR CONFIGURATION REQUEST TO INCLUDE c d  
e

## 2. REASON FOR OUTPUT

Format 1: Reports that the timing interval following an IMS level 3 or 4 initialization has expired and that the Automatic Ring Recovery (ARR) system of the IMS driver is now active for recovery of inactive nodes. During the timing interval, ARR will recover only those inactive nodes which are designated by Application Critical Node Recovery (ACNR).

Format 2: Reports start of a node recovery.

Format 3: Reports success of a node recovery.

Format 4: Reports abort of a node recovery.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5: Reports failure of a node recovery.

Format 6: Reports exceeding the node recovery threshold.

Format 7: Reports timeout awaiting a reply from MIRA.

Format 8: Reports stop of a node recovery.

Format 9: Reports a configuration request to include an isolated node into the active ring for an ACNR unconditional restore.

### 3. VARIABLE FIELD DEFINITIONS

- a Source of the recovery.
- ARR — IMS Automatic Ring Recovery.
  - CNR — IMS Critical Node Recovery for inactive BISO/EISO.
  - ACNR — Application Critical Node Recovery.
- b Type of recovery.
- RSTRT — Restart.
  - UCL — Unconditional restore.
  - COND — Conditional restore.
- c Ring node name.  
(e.g., RPCN00 0).
- d Configuration inclusion direction.
- IN BISO DIRECTION  
Attempt to configure ACNR node into the BISO end of the active ring.
  - IN EISO DIRECTION  
Attempt to configure ACNR node into the EISO end of the active ring.
  - IN EISO DIRECTION  
Normal ring is requested.
- e The value of the real-time-clock at the time the report is formatted. The real-time-clock has a granularity of 1 ms. Used in correlation with other reports.

### 4. ACTION TO BE TAKEN

Formats 1-4: None.

Formats 5-7: If the node maintenance mode is MAN, manual diagnosis and restoral of the node are required. Refer to input messages RST:LN, RST:RPCN, DGN:LN, and DGN:RPCN.

Format 8: Remove the inhibits against ARR, CNR or ALL to permit the automatic node recovery. Refer to input message ALW:DMQ.

Format 9: None.

- [8] REPT ARTS NOD AUTORST  
NOD UCL RST FOR LNaa bb STOPPED <UNKNOWN> - e
- [9] REPT ARTS RST cc dd SENT TO MIRA

## 2. REASON FOR OUTPUT

The ARTS process on the 3B provides a watchdog function that looks for hardware that may be stuck in transitional or incorrect states or has been out of service for an unusually long period of time. As a prevention mechanism, the hardware is given either a remove and unconditional restoral or just an unconditional restoral, whichever is appropriate.

Two types of hardware are covered: 1) CNI ring nodes that have signaling links; and 2) IOP devices. For CNI ring nodes, if a CNI node has had an ECD node state of ACT and all signaling links on the node have a state of OOS for a period of at least 15 minutes, then the node is a candidate for a remove and unconditional restore. This is done as a prevention against potential network or signaling link anomalies. This is done for domestic and international CCS7, and all PBX node types.

For IOP devices, if the device has been out of service due to non-manual means for at least 15 minutes, then the device will be given an unconditional restoral.

SEE PROPRIETARY NOTICE ON COVER PAGE

Both of these restoral mechanisms can be inhibited. To inhibit auto removal/unconditional restoral of CNI link nodes:

INH:DMQ;SRC NOD!

To inhibit auto unconditional restoral of IOP devices:

INH:DMQ;SRC ART!

Format [1] indicates that a CNI node is a candidate for removal/unconditional restore due to having been in the node ACT/link OOS condition for at least 15 minutes. No MIRA action has taken place at this point - the job is given to MIRA (the diagnostic manager in the 3B).

Formats [2] and [6] indicate that the removal or unconditional restore action for a CNI node has failed. The state of the node is in an unknown condition at this time. Manual action should be taken, see Action To Be Taken Section.

Format [3] indicates that the CNI node removal job was inhibited. This is the expected response if a INH:DMQ;SRC NOD! is in effect.

Format [4] indicates that an active CNI node removal or unconditional restoral was aborted by the user or ring initialization.

Format [5] is the success case. The CNI node has been removed and unconditionally restored. The node is currently in the ECD ACT state. The link state(s) is still dependent on network/facility/far end conditions.

Format [7] indicates that the removal of the CNI node has taken place, but the unconditional restoral has been inhibited by a INH:DMQ;SRC NOD! command.

Format [8] indicates that an unexpected action occurred in this mechanism. See Action To Be Taken Section.

Format [9] indicates that the IOP device unconditional restore job has been given to the diagnostic manager (MIRA).

### 3. VARIABLE FIELD DEFINITIONS

|         |                                                                                                                                                                                                                                                                                                                                  |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LNaa bb | UCB name of the node on the ring; i.e. LN00 1.                                                                                                                                                                                                                                                                                   |
| cc dd   | UCB name of IOP device to be restored; i.e. SDL 26.                                                                                                                                                                                                                                                                              |
| e       | Error in the interface with the diagnostic manager (MIRA). <ul style="list-style-type: none"><li>-3 — MIRA out of buffers.</li><li>-4 — MIRA can't spawn DIAMON.</li><li>-5 — Duplicate request already on queue.</li><li>-7 — Internal MIRA problem, request aborted.</li><li>-10 — Unit type is not a hardware type.</li></ul> |

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For Formats [1], [3], [5], and [9] there is no action required.

For Formats [2], [4], [6], and [7], the status of the CNI node should be checked using either 3B display pages 1105 or 1106 or input command **OP:NODES!** If the node is OOS, then the node should be put back in the ACT state. If there is any reason that the hardware status may be suspected faulty, then the restoral should be run conditionally. If in doubt, seek technical assistance.

For Format [8], if field 'e' has value -3 or -5, then no action is required. For other cases, seek technical assistance.

msg Message contents. Only the ATPCM status messages are listed here. All other messages are error reports and technical assistance must be sought if they occur.

LNg-m CALL BACKUP COMP (a calls, b ms)

LNg-m DB PUMP FROM MATE COMP (c ms)

LNg-m DB PUMP FROM 3B20 COMP (c ms)

APPLYING FIELD UPDATE TO ATPCM

ATP DUPLEX FAIL

ATP IN SERVICE AFTER d SECOND OUTAGE

MAKING LEVEL 1 RING INIT REQUEST

REQUESTED RESTART OF LNg-m

REQUESTED UCL RESTORE OF LNg-m

REQUESTING LEVEL 1 INIT

RESTARTING LNg-m

RESTARTING TASK task FOR FIELD UPDATE

RESTARTING TASK (task)

SENT CNR REQUEST FOR ATP LNg-m

STARTING FIELD UPDATE TASK

a Number of calls backed up.

b Duration of backup in milliseconds.

c Duration of data base pump in milliseconds.

d Duration of ATP duplex failure in seconds.

g Group number of ATP node (0 - 63).

SEE PROPRIETARY NOTICE ON COVER PAGE

m Member number of ATP node (1 - 15).

**4. ACTION TO BE TAKEN**

Seek technical assistance if errors occur.

**5. REFERENCES**

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

GENERIC ..... 4AP13 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

```
REPT ATPN LNa b ERR X'c SEQ d
FILE e LINE f ACTION g h AUX DATA WDS (X')
 iiii iiii iiii iiii
 .
 .
 .
 iiii iiii iiii iiii
 j
```

## 2. REASON FOR OUTPUT

To report ATPN defensive check failures. The failure data is delivered from the ATPN to 3B process Arts for spooler output. The message always prints to the maintenance printer and the CNILOG.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                     |
|---|---------------------|
| a | ATPN group number.  |
| b | ATPN member number. |
| c | ATPN error code.    |

0x3003 — State Control: unable to send IMS message.  
0x3004 — State Control: unable to send RTX message.  
0x3005 — State Control: timed out waiting for home DLN ID.  
0x3006 — State Control: timed out waiting for mate ID.  
0x3007 — State Control: timed out waiting for clocks to sync.  
0x3008 — State Control: IMS message dump (process exception).  
0x4000 — Measurements error.  
0x5000 — Sync: process ID error.  
0x5001 — Sync: unable to open channel.  
0x5002 — Sync: failed to send RTX message.  
0x5003 — Sync: failed to send second RTX message.  
0x5004 — Sync: failed to send IMS message.  
0x5005 — Sync: out of ring write buffers.  
0x5006 — Sync: IMS message dump (process exception).  
0x5007 — Sync: master/slave operation mismatch.  
0x6000 — Switch: process ID error.  
0x6001 — Switch: unable to open channel.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x6002 — Switch: failed to send RTX message.  
0x6003 — Switch: failed to send second RTX message.  
0x6004 — Switch: failed to send IMS message.  
0x6005 — Switch: out of ring write buffers.  
0x6006 — Switch: IMS message dump (process exception).  
0x6007 — Switch: master/slave operation mismatch.  
0x7000 — Backup: process ID error.  
0x7001 — Backup: unable to open channel.  
0x7002 — Backup: failed to send RTX message.  
0x7003 — Backup: failed to send second RTX message.  
0x7004 — Backup: failed to send IMS message.  
0x7005 — Backup: out of ring write buffers.  
0x7006 — Backup: out of call blocks.  
0x7007 — Backup: rcvd: P1 TSN missing.  
0x7008 — Backup: rcvd: P1 TSN out of range.  
0x7009 — Backup: rcvd: P2 TSN out of range.  
0x700a — Backup: failed to start internal timer.  
0x700b — Backup: failed to start user A timer.  
0x700c — Backup: failed to start user B timer.  
0x700d — Backup: send: internal timer not found.  
0x700e — Backup: send: user A timer not found.  
0x700f — Backup: send: user B timer not found.  
0x7010 — Backup: send: bad P1 TSN <--> call block link.  
0x7011 — Backup: send: bad P1 TSN <--> call block link.  
0x7012 — Backup: software version mismatch with mate node.  
0x7013 — Backup: IMS message dump (process exception).  
0x7014 — Backup: master/slave operation mismatch.  
0x8000 — Call Proc: failed to start a timer.  
0x8001 — Call Proc: non-initiator as first trigger digit.  
0x8002 — Call Proc: timed out on an idle call block.  
0x8003 — Call Proc: invalid timer type.  
0x8004 — Call Proc: invalid generic action.  
0x8005 — Call Proc: bad/unassigned SCS state.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x8006 — Call Proc: bad / unassigned generic action state.  
0x8007 — Call Proc: missing mandatory parameters on redirection.  
0x8008 — Call Proc: trigger / state / direction queue full - trigger lost.  
0x8009 — Call Proc: invalid trigger / state / direction queue state.  
0x800a — Call Proc: bad announcement ID detected.  
0x800b — Call Proc: bad announcement ID detected.  
0x800c — Call Proc: collect order sent to unequipped SCU.  
0x800d — Call Proc: bad announcement set detected.  
0x800e — Call Proc: bad list order sent.  
0x800f — Call Proc: SCS digit lost due to signal corruption.  
0x8010 — Call Proc: unassigned low priority report code.  
0x8011 — Call Proc: unassigned digit report code.  
0x8012 — Call Proc: unassigned opcode received in validation report.  
0x8013 — Call Proc: call block out of range.  
0x8014 — Call Proc: incorrect message data layout.  
0x8015 — Call Proc: IE does not fit into the call block.  
0x8016 — Call Proc: unrecognizable IE data.  
0x8017 — Call Proc: out of ring write buffers.  
0x8018 — Call Proc: unexpected message received on an idle trunk.  
0x8019 — Call Proc: received message on P2 with no P1.  
0x801a — Call Proc: disconnect message without a Cause IE.  
0x801b — Call Proc: facility message without a message type.  
0x801c — Call Proc: returned ATP message.  
0x801d — Call Proc: unexpected message received on P2 trunk.  
0x801e — Call Proc: unknown ATP message subtype.  
0x801f — Call Proc: unexpected timeout.  
0x8020 — Call Proc: failed to write an IMS message.  
0x8021 — Call Proc: failed to send a message via \_ims\_write().  
0x8022 — Call Proc: failed to build IMS header.  
0x8023 — Call Proc: incorrect call block data.  
0x8024 — Call Proc: incorrect generic state.  
0x8025 — Call Proc: bad reason passed to disable ATP.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x8026 — Call Proc: no RNA when sending to the DCN.  
0x8027 — Call Proc: reset active indicator on an expired timer.  
0x8028 — Call Proc: no home DLN RNA available.  
0x8029 — Call Proc: invalid call block index derived from a timer.  
0x802a — Call Proc: invalid validation key found.  
0x802b — Call Proc: out of range queue index found.  
0x802c — Call Proc: no P1 TSN in timed out call block.  
0x802d — Call Proc: bad TSN table entry.  
0x802e — Call Proc: call block address out of range.  
0x802f — Call Proc: multiple Idle CB Lists being audited.  
0x8030 — Call Proc: timeout for P1 announcement acknowledge.  
0x8031 — Call Proc: timeout for P2 announcement acknowledge.  
0x8032 — Call Proc: timeout for P1 reprompt acknowledge.  
0x8033 — Call Proc: timeout for P2 reprompt acknowledge.  
0x8034 — Call Proc: timeout for P1 digit collect acknowledge.  
0x8035 — Call Proc: timeout for P2 digit collect acknowledge.  
0x8036 — Call Proc: timeout for P1 trigger collect acknowledge.  
0x8037 — Call Proc: timeout for P2 trigger collect acknowledge.  
0x8038 — Call Proc: timeout for partition response.  
0x8039 — Call Proc: timeout for partition complete.  
0x803a — Call Proc: timeout for redirect response.  
0x803b — Call Proc: timeout for redirect complete.  
0x803c — Call Proc: Access Table entry out of range.  
0x803d — Call Proc: ATV Table entry inactive.  
0x803e — Call Proc: missing mandatory parameters on partition.  
0x803f — Call Proc: unexpected message received on P1 trunk.  
0x8040 — Call Proc: call processing message failed to be sent.  
0x8041 — Call Proc: missing mandatory IEs for route call.  
0x8042 — Call Proc: bad NOTIFY indicator.  
0x8043 — Call Proc: timeout for route call proceeding.  
0x8044 — Call Proc: halt timed out; processing resumed.  
0x8045 — Call Proc: timers out of order.  
0x8046 — Call Proc: could not open IMS channel.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x8047 — Call Proc: \_ims\_read() returned ENDEV.  
0x8048 — Call Proc: unknown \_ims\_read() return.  
0x8049 — Call Proc: process PID error.

| d | Number of errors detected by ATPN since the ATPN was last restored.                                |
| e | ATPN source file name where the error was detected.                                                |
| f | ATPN source file line number where the error was detected.                                         |
| g | Action taken by the ATPN:<br><br>0 — No action taken.                                              |
| h | Number of data words associated with the defensive check (maximum of 86 ATPN words).               |

SEE PROPRIETARY NOTICE ON COVER PAGE

iiiiiii ATPN memory dump unique to the ATPN error code.

j Explanation of error.

#### **4. ACTION TO BE TAKEN**

Seek technical assistance.

#### **5. REFERENCES**

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:AUDSTAT  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT AUDSTAT a  
ROUTINE AUDIT SCHEDULING IS b  
INHIBITED AND/OR BLOCKED AUDITS:  
AUDIT AUDIT INSTANCES INHIBITED/BLOCKED  
NAME MBR INH NAME INH BLK  
c d e f g h
- [2] REPT AUDSTAT COMPLETED  
ROUTINE AUDIT SCHEDULING IS b
- [3] REPT AUDSTAT ABORTED ECD INTERFACE ERROR i [AUDIT RID j]
- [4] REPT AUDSTAT ABORTED CANNOT OPEN OUTPUT FILE k
- [5] REPT AUDSTAT ABORTED CANNOT WRITE OUTPUT FILE k
- [6] REPT AUDSTAT ABORTED CANNOT CREATE TEMPORARY FILE

## 2. REASON FOR OUTPUT

Formats 1 and 2 print the status of audits controlled by the System Integrity Monitor (SIM). Inhibited audits whose mode permissions prevent them from executing in routine or software request modes will not appear in the output message, unless the blocking state causes the audit to appear. In this case, the inhibit source will be enclosed in parentheses.

Blocked audits whose mode permissions prevent them from executing in any mode will not appear in the output message.

Format 3 reports an Equipment Configuration Database (ECD) interface error.

Format 4 reports an error when creating a temporary file.

Format 5 reports an error when writing to a temporary output file.

Format 6 reports an error when unable to create a uniquely named temporary file.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a                    Output message status:
- COMPLETED    — Last or only segment of message.
- IN PROGRESS — Intermediate segment(s) of message.
- STARTED        — First segment of message.
- b                    Master audit inhibit status for all audits controlled by SIM:
- ALLOWED — Not inhibited.
- AUTOMATICALLY INHIBITED
- IN UNKNOWN STATE
- MANUALLY INHIBITED
- c                    Audit name. This field is blank for all instances after the first.
- d                    Member number. This field is blank for all instances after the first.
- e                    Inhibit state of the audit:
- AUTO — Automatic action.
- MAN — Manual request.
- ??? — Unrecognized reason.
- If the audit is not inhibited, this field is blank. This field is also blank for all instances after the first.
- f                    Instance name. This field may be blank.
- g                    Inhibit state of a given instance of the audit blank if the audit is not inhibited:
- AUTO — Automatic request.
- MAN — Manual request.
- ??? — Unrecognized reason.
- h                    Y if this instance of the audit is blocked. This field is blank if this instance of the audit is not blocked.
- i                    ECD interface error number:
- 10 — Cannot open audit record sequence.
- 11 — Cannot sequence through audit records.
- 20 — Cannot open audit instance record sequence.
- 21 — Cannot sequence through instance records.
- 30 — Cannot open audit instance record sequence.
- 31 — Cannot sequence through instance records.
- j                    Associated audit Record Identification (RID).
- k                    Name of temporary file.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

If Formats 1, 2, or 3 prints, use the OP:AUD input message to obtain additional status on the audits. Use the ALW:AUD input message to allow audits which are to be allowed.

Format 4 indicates all the inodes of the tmp file system are being used. Clean up unused files in the tmp file system using the CLR:FILESYS;FILE input command.

Format 5 indicates all tmp file system space has been used. Clean up unused files in the tmp file system using the CLR:FILESYS;FILE input command.

Format 6 indicates system resources do not permit the running of this command at this time; retry later. If command continues to fail, see technical assistance.

ID ..... REPT:AUTORST  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT AUTORST FAILURE FOR a b [c] [d]

## 2. REASON FOR OUTPUT

To report that the Automatic Diagnostic Process (ADP) was unable to restore a faulty hardware unit, and that it will no longer attempt to diagnose or restore the specified hardware unit or community.

## 3. VARIABLE FIELD DEFINITIONS

|   |                 |
|---|-----------------|
| a | Unit name.      |
| b | Unit number.    |
| c | Subunit name.   |
| d | Subunit number. |

## 4. ACTION TO BE TAKEN

Manual action is required to diagnose, repair, and restore the unit to service.

## 4ESS™/APS Input/Output Message Manual Comment Form

Lucent Technologies opinion. We would like to know how well this document meets your needs. Please check the appropriate column to indicate your opinion of the document for the categories listed on the right, and answer the questions following the table. Your comments will help us improve future issues. Thank you in advance for taking the time to fill out this form.

Generic: 4AP20

Issue: 9.4

|              | Excellent | Good | Fair | Poor |
|--------------|-----------|------|------|------|
| Ease of Use  |           |      |      |      |
| Accuracy     |           |      |      |      |
| Completeness |           |      |      |      |
| Organization |           |      |      |      |
| Appearance   |           |      |      |      |
| Writing      |           |      |      |      |
| Clarity      |           |      |      |      |
| Front Matter |           |      |      |      |

1. How did you use this document? (Circle one.)  
To learn procedures, To get background information, As a quick reference,  
Other (specify): \_\_\_\_\_
2. Could information be organized differently to help you on the job? YES NO  
If YES how? \_\_\_\_\_
3. Anything missing that should be added? YES NO  
Describe: \_\_\_\_\_
4. Overall how would you rate this document as an aid in doing your job?  
EXCELLENT VERY GOOD GOOD FAIR POOR
5. Any additional comments (packaging, format) ? \_\_\_\_\_

UTILITY ID: i                      PROCESS NUMBER: j

OST CODE: k  
OST ARGUMENTS:  
                    l  
REAL TIME CLOCK: m

## 2. REASON FOR OUTPUT

While servicing an Operating System Trap (OST), the kernel detected an invalid condition.  
The client process is also faulted with a BADOST fault.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                     |
|---|-------------------------------------------------------------------------------------|
| a | Sequence number of error.                                                           |
| b | CU number of unit running when fault occurred.                                      |
| c | Time in form MM/DD/YY HH:MM:SS.                                                     |
| d | Program Address when error occurred.                                                |
| e | Program status word of the faulted process.                                         |
| f | Primary segment base register of faulted process.                                   |
| g | Secondary segment base register of faulted process.                                 |
| h | The contents of the faulted process's 15 general purpose registers.                 |
| i | Faulted process's utility identification code.                                      |
| j | Faulted process's process number.                                                   |
| k | The code number of the OST. Check Output Appendix APP:OST for OST code definitions. |

SEE PROPRIETARY NOTICE ON COVER PAGE

l                      The arguments passed to OST (7 maximum).  
m                      Real time clock expressed in hexadecimal.

#### **4. ACTION TO BE TAKEN**

Get a complete OP:ST-PROC listing (both kernel and nonkernel processes). Check the "/cdmp" directory for any recent core dump files, and save most recent dump files on tape. Then contact next level of technical support.

ID ..... REPT:BOOTAUD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has 11 formats.

- [1] REPT BOOTAUD STARTING AUDIT OF BOOT CRITICAL DATA
- [2] REPT BOOTAUD a - TOTAL OF b ERRORS DETECTED
- [3] REPT BOOTAUD MSG IP CHECKING FILES c
- [4] REPT BOOTAUD MSG IP VTOC AUDIT COMPLETE b ERRORS DETECTED
- [5] REPT BOOTAUD MSG IP IFB AUDIT COMPLETE b ERRORS DETECTED  
d-e:f d-e:f d-e:f d-e:f d-e:f d-e:f
- [6] REPT BOOTAUD MSG IP CRITICAL FILE  
AUDIT COMPLETE b ERRORS DETECTED
- [7] REPT BOOTAUD g
- [8] REPT BOOTAUD ERROR h
- [9] REPT BOOTAUD CRITICAL i
- [10] REPT BOOTAUD ABORTED j
- [11] REPT BOOTAUD WAITING FOR BOOTAUD PID k TO FINISH

## 2. REASON FOR OUTPUT

Under normal conditions, only Format 1 through Format 3 will be printed to indicate that the audit completed with zero errors.

Formats 4 through 10 indicate a possible system problem that could cause a system reboot to fail. ALL BOOTAUD failures should be given immediate attention. Seek technical assistance immediately.

Format 4 indicates an MHD VTOC problem. The supplementary data that is printed is self-explanatory. Seek technical assistance immediately.

Format 5 indicates a CNI ring problem. There are certain instances where an Inter Frame Buffer (IFB) is required between CNI ring nodes. The existence on an IFB is indicated by the ECD HV value.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 indicates that 3B disk files are missing or corrupt.

Formats 7 through 10 are the general formats for information, warning, error and critical errors that BOOTAUD detects. There are many different messages and the data is meant to be self-explanatory.

Format 10 is output when an error condition occurs that prevents the completion of the BOOTAUD audit.

Format 11 occurs when the BOOTAUD process is invoked while another instance of BOOTAUD is still running. If this condition persists for 60 minutes, the waiting BOOTAUD will abort.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                                         |
|---|---------------------------------------------------------------------------------------------------------|
| a | COMPLETE if the audit completed or ABORTED if abnormal termination occurred.                            |
| b | The number of errors detected.                                                                          |
| c | The number of files that have been audited.                                                             |
| d | The CNI ring node group number.                                                                         |
| e | The CNI ring node member number.                                                                        |
| f | The hexadecimal HV value from the ECD for the CNI ring node.                                            |
| g | Supplemental data describing how BOOTAUD is proceeding.                                                 |
| h | Supplemental data describing the problem found.                                                         |
| i | Supplemental data describing a critical problem.                                                        |
| j | Supplemental data describing the reason for BOOTAUD early termination.                                  |
| k | The process id of a previously running BOOTAUD that is delaying the execution of this BOOTAUD instance. |

### **4. ACTION TO BE TAKEN**

ALL BOOTAUD failures should be given immediate attention. Seek technical assistance immediately.

### **5. REFERENCES**

None.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT BWMINT a

## 2. REASON FOR OUTPUT

To report error messages when errors occur during a field update.

## 3. VARIABLE FIELD DEFINITIONS

a Describes the specific error that occurred. See the Field Update Error Codes Output Appendix, APP:FUEC, for explanations of error codes which may appear in error messages.

## 4. ACTION TO BE TAKEN

The error should be corrected and the field update continued. If the error cannot be corrected, the update should then be reset. If the update cannot be reset, it must be omitted before another update can be applied.

ID ..... REPT:CD-CIA  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT C/D CIA CANNOT OPEN DEVICE a
- [2] REPT C/D CIA CANNOT GET PROCESS ID OF DAP
- [3] REPT C/D CIA CANNOT SEND A MESSAGE TO DAP

## 2. REASON FOR OUTPUT

Format 1 informs the user that the current state of the Switching Control Center (SCC) links indicates that the Equipment Configuration Database (ECD) must be updated in order for the SCC to become active.

Formats 2 and 3 indicate that the Critical Indicator Administrator (CIA) could not communicate with the Display Administration Process (DAP).

## 3. VARIABLE FIELD DEFINITIONS

a Device filename.

## 4. ACTION TO BE TAKEN

Format 1 prints when the status of the SCC links in the ECD is something other than ACT, STBY, OOS or INIT. If the SCC is not needed, use Recent Change/Verify (RC/V) to delete the ULARP record for CIA to prohibit ULARP from trying to restart the CIA process. If the SCC link is needed, follow growth procedures to activate the link.

If Format 2 or Format 3 is output, seek technical assistance.

## 5. REFERENCES

OMDB Key  
Formats 1, 2, and 3 have an OMDB key of 273.

## 1. FORMAT

REPT C/D DLGGETTY CHANID FOUND IN LOGDEV RECORD

## 2. REASON FOR OUTPUT

To inform the user that the DLGGETTY process has encountered an error while trying to process initialization information for a control/display device. The messages will appear on the originating device only.

## 3. VARIABLE FIELD DEFINITIONS

See Reason For Output.

## 4. ACTION TO BE TAKEN

Seek technical assistance to verify correctness of channel Identification (ID) field found in the logdev form for the dialogue device.

## 5. REFERENCES

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:CD-ERROR  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT C/D ERROR 1 a [PID b] [APPLICATION NOTIFICATION FAILURE]
- [2] REPT C/D ERROR 2 c DAP {LOCAL DEVICE|PROCESS} I/O BUFFER OVERFLOW [d]
- [3] REPT C/D ERROR 3 {1|2} e
- [4] REPT C/D ERROR 3 3 f
- [5] REPT C/D ERROR 3 4 CANNOT ALLOCATE MEMORY FOR PAGE INITIALIZATION
- [6] REPT C/D ERROR 4 g h [ERRNO i]
- [7] REPT C/D ERROR 4 1 j
- [8] REPT C/D ERROR 4 8 DAPMALLOC FAILED DATA LOST FOR DEVICE [k]
- [9] REPT C/D ERROR 5 1 DAP EXITING RECEIVED SIGNAL l

## 2. REASON FOR OUTPUT

To inform the user that Control/Display (C/D) detected an exceptional condition while trying to process a message or poke request from the maintenance Cathode Ray Terminal (CRT).

For Format 1, error types 1, 2, and 3 indicate severe problems in which the Display Administration Process (DAP) died upon initialization and has been restarted by ULARP. Error types 4 through 7 can be ignored unless persistent, which indicates technical assistance is needed.

Format 2 indicates that DAP is overloaded with outstanding writes. This may indicate an input/output driver or system overload, or that more requests for change to displays are arriving than DAP can handle.

For Format [3-5], error types 1, 2, and 4 indicate that DAP could not allocate memory or process the transtab file, and that a default translation table will be used. Error type 3 indicates that tty information is missing for a particular terminal, and that DAP is using default information for the terminal.

For Format [6-8], error types 3, 4, 5, and 7 indicate an error while attempting to attach a device. Error type 1 indicates that DAP could not open the translation table, and that a default is being used. Error type 2 indicates that DAP incurred a write error, and data for a terminal has been lost. Error type 6 indicates that a problem occurred in finding or

SEE PROPRIETARY NOTICE ON COVER PAGE

updating an indicator for a page. Error type 8 indicates that DAP was unable to request new memory to buffer output destined for a terminal, and that data has been lost.

Format 9 occurs when DAP dies from a signal, and may indicate a problem that should be noted.

### 3. VARIABLE FIELD DEFINITIONS

- a Error type:
- 1 — Unable to attach to C/D port
  - 2 — Cannot enable message reception
  - 3 — Unable to get shared segment or fork/exec Critical Indicator Administrator (CIA)
  - 4 — Invalid C/D administrative request received
  - 5 — Unable to send Display Administration Process (DAP) status to application
  - 6 — Unable to send message to page owner
  - 7 — Invalid C/D poke operation request received
- b Process Identification (ID) of the process which sent the bad message.
- c Error type:
- 2 — Write error
- d Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then a is the device ID.
- 1 File format error
- 2 File read failure
- 3 gettrap returned no data
- 4 Memory request failure
- e File name.
- f Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then a is the device ID.
- g Error type:
- 2 — Write error.
  - 3 — Attach settrap error.
  - 4 — Attach gettrap error.
  - 5 — Attach incore Equipment Configuration Database (ECD) error.
  - 6 — Indicator operation error.
  - 7 — Retrieve incore ECD device record error.
- h Device ID which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then a is the device ID.

#### 4. ACTION TO BE TAKEN

For Format 1, error types 1, 2, and 3 indicate severe problems in which DAP died upon initialization, and has been restarted by ULARP. Error types 4 through 7 can be ignored unless persistent, which indicates technical assistance is needed.

For Formats 2 through 9, except where noted for Format 4, if the message is intermittent, take no action. If the message persists for a local terminal, power cycle the terminal. If it persists for a removed terminal, terminate and re-establish the terminal's connections.

For Format 6 through 8, error types 3, 4, 5, and 7 indicate an error while attempting to attach a device. The terminal should be power cycled for these conditions. If the problem persists, seek technical assistance.

#### 5. REFERENCES

OMDB Key

Formats 1 through 9 have an OMDB key of 175.

Output Appendix

ID ..... REPT:CD-GETTY  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT C/D GETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT
- [2] REPT C/D GETTY UNABLE TO ACCESS ECD FOR a
- [3] REPT C/D GETTY UNABLE TO COMMUNICATE WITH DAP PORT b
- [4] REPT C/D GETTY FOR DEVICE a FAILED TO CREATE c
- [5] REPT C/D GETTY PATHNAME NOT IN THE ECD FOR a

## 2. REASON FOR OUTPUT

To inform the user that the CDGETTY process has encountered an error while trying to process initialization information for Control/Display (C/D) devices following terminal restores. The messages may appear on the originating device, or the Receive-Only Printer (ROP).

## 3. VARIABLE FIELD DEFINITIONS

- a Device Identification (ID) which is a single character (lower case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then a is the device ID.
- b Port ID.
- c Pathname of the process to be created.

## 4. ACTION TO BE TAKEN

Format 1 indicates that the UNIX® process /prc/init is not setting the proper environment for `getty`. Seek technical assistance.

Format 2 indicates that either it could not attach to the incore database or it failed to get the required record; the `getty` record, for example. Seek technical assistance.

Format 3 indicates that the DAP process is not connected to its port. Seek technical assistance to verify that the DAP process is currently running.

Formats 4 and 5 indicate that they could not execute the shell listed in the `getty` record. Verify the correctness of the `getty` record in the incore database and seek technical assistance.

## 2. REASON FOR OUTPUT

To report errors detected by poker associated with Control/Display (C/D) devices.

Formats 1, 9, and 11 indicate errors in setting up or diverting output to a secondary reader (for example, Recent Change And Verify [RCV] / Equipment Configuration Database [ECD]).

Formats 2, 4 through 8, 12, and 13 indicate poker initialization errors.

Format 10 indicates an error with sending poke input to Display Administration Process (DAP) from a dialogue terminal.

SEE PROPRIETARY NOTICE ON COVER PAGE

| e | Device Identification (ID) which is a single character (lower case letter) suffix representing a control/display device. For example, if a logical device is defined as /dev/cda, then a is the device ID. |
| f | Failure return from write().                                                                                                                                                                               |

### 4. ACTION TO BE TAKEN

For Formats 1, 2, 5, and 7 through 11, an operating system function call is failing; seek technical assistance.

For Format 3, if DAP is running, execute menu 807 from the C/D update page to restart the poker. If DAP is not running, seek technical assistance.

For Format 4, seek technical assistance to verify correctness of ttopt form for this device.

For Format 6, seek technical assistance to verify correctness of pagename field found in the getty form for this device. If correct, take no action; message was the result of a request to display an uninitialized page at time of request.

For Format 12, seek technical assistance to verify correctness of channel ID field found in the logdev form for this device.

For Format 13, if CSOP is running, display page 103 and execute menu 807 to restart the poker. If CSOP is not running, seek technical assistance.

| f | File name.                                                                                                                                                                                |
| g | Pathname of secondary input read process (Recent Change and Verify [RCV]).                                                                                                                |
| h | Device ID which is a single character (lower-case letter) suffix representing a control display device. For example, if a logical device is defined as /dev/cda, then a is the device ID. |

#### **4. ACTION TO BE TAKEN**

For Formats 1 and 2, if the message is printed for a local terminal, power cycle the terminal. If the message is printed for a remote terminal, terminate and re-establish the terminal's connection.

For Format 3, if the system initialization is in progress, wait and re-enter the menu later to re-start the STARTER process. If system initialization is not in progress, mount the /tmp filesystem, or seek technical assistance.

Format 4 indicates the child process of STARTER terminated abnormally. Re-enter the menu to re-start the STARTER process.

For Formats 5 through 10, re-enter the menu to try to re-start the STARTER process. If this fails again, seek technical assistance.

Format 11 indicates that an active child process is running on the named terminal. Use the PF3 key to resume communication with that process.

- [2] REPT CFT LIB AUTHORITY GROUPS FILE READ ERROR
- [3] REPT CFT LIB AUTHORITY GROUPS FILE TOO MANY GROUPS
- [4] REPT CFT LIB UNABLE TO OPEN AUTHORITY FILE
- [5] REPT CFT LIB AUTHORITY FILE READ ERROR
- [6] REPT CFT LIB UNABLE TO RETRIEVE DATE FORMAT FROM ECD a
- [7] REPT CFT LIB ILLEGAL DATE FORMAT IN ECD
- [8] REPT CFT LIB UNABLE TO RETRIEVE IM FOR ECHO
- [9] REPT CFT LIB CANNOT ACCESS ECD PDS ASSUMED
- [10] REPT CFT LIB IA01 RMOVSEG FAILED ERRNO b
- [11] REPT CFT LIB GETSEG FAILED ERRNO b
- [12] REPT CFT LIB UNABLE TO PLACE INPUT MESSAGE IN ENVIRONMENT
- [13] REPT CFT LIB CLEARING SEMAPHORE

## 2. REASON FOR OUTPUT

To report a Craft Library (CFT LIB) related occurrence or error.

Format 1 indicates that the craft library could not access the file that contains the currently valid input message authority groups.

Format 2 indicates that the craft library encountered a read error when attempting to read the input message authority groups file.

Format 3 indicates that an error has been detected in the input message authority groups file. This can occur if there are too many authority groups specified (more than the defined maximum, currently 91) or if the wrong file is read.

Format 4 indicates that the craft library could not access the file that contains the current assignments of authority groups to persons and terminals.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 indicates that the craft library encountered a read error when attempting to read the authority assignment file.

Format 6 indicates that the craft library could not retrieve the date format from the `eaiopt` record in the Equipment Configuration Database (ECD).

Format 7 prints when the craft library detects an error in the layout of the date found in the `eaiopt` record in the ECD. The layout must include the desired position of the month (m), day (d), and year (y) with optional separators (for example... ":", "-"). Some example layouts include: `m:d:y` and `d-m-y`.

Format 8 prints when the craft library is unable to retrieve an input message string from the calling process' environment.

Format 9 prints when the craft library is either unable to attach to the ECD or unable to read the `splinfo` record in the ECD to determine whether the system is in PDS or MML mode. PDS mode will be assumed.

Format 10 indicates that the craft library failed to remove the incore ECD data segment(s) from its address space.

Format 11 indicates that the craft library failed to add the incore ECD data segment(s) to its address space.

Format 12 indicates that the craft library failed to put the input message into the client process environment.

Format 13 indicates that the craft library is releasing a locked semaphore.

#### **4. ACTION TO BE TAKEN**

For Formats 1 through 12, no action is needed.

For Format 13, check the /cdmp directory for a dump file of the process that had the semaphore locked. If a file is present, save the file for future analysis.

#### **5. REFERENCES**

OMDB Keys

Formats 1 through 5, 8, and 10 through 13 have an OMDB key of 290.

Formats 6, 7, and 9 have an OMDB key of 291.

ID ..... REPT:CFTSHL  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT CFTSHL TERMINAL IN SERVICE \*\*\* a  
CAPABILITY MODE / b
- [2] REPT CFTSHL EOF ENCOUNTERED
- [3] REPT CFTSHL UNABLE TO READ LINE c OF .pname file  
INSTALL A .pname FILE in DIRECTORY d AND  
SHELL WILL RECOVER
- [4] REPT CFTSHL CANNOT CHANGE DIRECTORY TO e
- [5] REPT CFTSHL SETGID TO f FAILED
- [6] REPT CFTSHL SETUID TO g FAILED
- [7] REPT CFTSHL CANNOT CREATE h AS ALTERNATE SHELL
- [8] REPT CFTSHL INTERRUPT RECEIVED
- [9] REPT CFTSHL INVALID ENVIRONMENT ARGUMENT PASSED  
TO ALTERNATE SHELL
- [10] REPT CFTSHL UNABLE TO READ LINE c OF .pname FILE FOR  
ALTERNATE SHELL AND ENVIRONMENT ARGUMENT MISSING
- [11] REPT CFTSHL CANNOT CREATE SEGMENT FOR INPUT AND OUTPUT
- [12] REPT CFTSHL ON MTTY WILL USE DEFAULT .PNAME FILE
- [13] REPT CFTSHL CRAFT SHELL IS IN LIMP CAPABILITY MODE

## 2. REASON FOR OUTPUT

To report a CFTSHL-related occurrence or error. The messages may appear on the input (requesting) terminal, the Receive-Only Printer (ROP), or both depending on the mode (terminal reading/background execution) of the CFTSHL. Some messages may be appended to an input command.

Format 1 indicates the CFTSHL is ready to accept input.

Format 2 indicates the CFTSHL has been terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 indicates a command has requested a change to an environment that does not exist in the .pname file. (This format is for Lucent Technologies use only.)

Format 4 indicates a request to change an execution directory as a result of an environment change has not been honored. (This format is for Lucent Technologies use only; occurs when cd command to variable b fails.)

Format 5 indicates an attempt to set the group Identification (ID) for the CFTSHL failed. (This format is for Lucent Technologies use only.)

Format 6 indicates an attempt to set the user ID of the CFTSHL failed. (This format is for Lucent Technologies use only.)

Format 7 indicates the failure of an alternate shell process creation. (This format is for Lucent Technologies use only.)

Format 8 prints as a result of encountering an interrupt. This interrupt usually occurs as a result of depressing the BREAK key.

Format 9 prints when CFTSHL is executed from another process (shell) and an improper environment is passed as argument two.

Format 10 prints when an alternate CFTSHL is invoked and the request environment cannot be read from the .pname file.

Format 11 prints when CFTSHL fails to allocate a memory segment for I/O buffer using RTR system call makeseg( ).

Format 12 prints when a CFTSHL is invoked for a maintenance terminal and the .pname file cannot be found in the current working directory. The CFTSHL will then use a default .pname file.

Format 13 indicates that the CFTSHL cannot attach to the *Input Message Catalog*.

### 3. VARIABLE FIELD DEFINITIONS

|     |                                             |
|-----|---------------------------------------------|
| a   | CFTSHL capability mode: LIMP, PART or FULL. |
| b   | Input message syntax: PDS or MML.           |
| EOF | End of file.                                |
| c   | Label of line.                              |
| d   | Directory.                                  |
| e   | Name of the requested directory.            |
| f   | Name of the requested group ID.             |
| g   | Name of the requested user ID.              |
| h   | Pathname of the alternate shell process.    |

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For Format 3 the command or the .pname file is in error and must be corrected. For all other formats, escalate through appropriate channels.

#### **5. REFERENCES**

OMDB Keys

Formats 11 and 13 have an OMDB key of 299.

Format 12 has an OMDB key of 298.

ID ..... REPT:CMMSADM  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

REPT CMMSADM  
a

## 2. REASON FOR OUTPUT

CMMSADM is a kernel level process which collects the measurement data and provides the network administrative clock message handling. Messages are output when a significant event occurs.

## 3. VARIABLE FIELD DEFINITIONS

a                      The field labeled a represents the body of the message.

## 4. ACTION TO BE TAKEN

\_MEDCSTRT EVENT BEFORE START\_PROC, SKIP A PDC \_MEDCSTRT  
event was received before the start processing signal from CNIINIT.  
\_MEDCSTRT' indicates' the' beginning' of a periodic data collection period (PDC).  
Seek assistance from field support group.

x EVENT BEFORE START\_PROC <x>  
event was received before the start processing signal from CNIINIT. The event  
may be \_MSG\_WAIT which indicates an IMS message has been received or  
\_MEDCDONE which indicates the end of a periodic data collection period. Seek  
assistance from field support group.

MASTER CLOCK NODE HAS NOT RESPONDED TO x REQUESTS FOR THE TIME  
No response has been received to <x> query requests to the master clock node for  
the network time. Seek assistance from field support group.

QUERYING MASTER CLOCK NODE, HOURLY TIME MESSAGE NOT RECEIVED FROM  
MASTER CLOCK NODE  
The master clock node has not sent the hourly time message. The local node will  
query the master and if no response is received the preceding message will be  
displayed. No action required unless a response to the query is not received.

COMPLETED INITIALIZATION OF NETWORK CLOCK: MASTER CLOCK NODE IS pc  
The local clock node has received response to a query request and has determined  
the master clock node to be <pc>. No action is required.

SEE PROPRIETARY NOTICE ON COVER PAGE

**UPDATED SYSTEM CLOCK: TIME DIFFERENCE (MSEC) = time**

The network time has been updated for the node. The time difference between the master clock node and the local node is provided as <time>. No action is required.

**RECEIVED FORCED SWITCH MESSAGE: MASTER CLOCK NODE IS pc**

The mate clock node is informing the local node that the master clock node has gone out of service. The local node marks the mate clock node as the new master. No action is required.

**MASTER CLOCK IS OUT OF SERVICE: FORCED SWITCH BROADCAST TO ALL  
ADJACENT NODES**

The mate clock node has detected that the master clock node has gone out of service. Forced switch messages will be broadcast to all adjacent nodes. No action is required.

**BROADCAST HOURLY TIME TO ALL NETWORK NODES: TIME (MSEC) = time**

Each hour the current network time is broadcast from the master clock node to its adjacent nodes for distribution to all network nodes. No action is required.

**RECEIVED TIME MESSAGE FROM THE MATE CLOCK: FORCING SWITCH TO pc**

The time message received was from the mate clock node rather than the master clock as expected. The forced switch message was not received by this node. No action is required.

**MATE CLOCK THINKS IT'S MASTER: SWITCHING TO THE MATE FUNCTION**

Both STPs are performing the master clock function. The first point code listed in the clkdata file switches to the mate function when it receives the hourly time message from what it thinks is the mate clock node. No action is required.

**UNEXPECTED FORCED SWITCH MESSAGE RECEIVED FROM pc**

The forced switch message was received by the master clock node from the mate clock node, the forced switch message was received by the mate clock node from what it thought was the master clock node, or the forced switch message was received by a slave node from a clock node other than the one it thought was the mate clock node. For all of these cases, no action is required.

ID ..... REPT:CMMSDP  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

REPT CMMSDP  
a

## 2. REASON FOR OUTPUT

CMMSDP is a user level process which accumulates the measurement data into the history files as specified in the MOC history file descriptor table and generates the reports as specified in the MOC schedule table. Messages are output when a system error is encountered or when an unexpected problem arises.

## 3. VARIABLE FIELD DEFINITIONS

a                      The field labeled a represents the body of the message.

## 4. ACTION TO BE TAKEN

### MEASUREMENT REPORTS ARE INHIBITED

Simply means that measurement reports that would normally be generated by CNI will not be generated. This message results if the user previously input the command to manually inhibit these reports. See the INH:REPORT command in the IM. This message will print about once every 30 minutes from the time the reports are inhibited. Note that CNI measurements will continue to be collected, only the reporting of them is inhibited.

### IMS MEASUREMENTS ARE CURRENTLY INHIBITED

Certain IMS measurements will not be collected or accumulated during the period that IMS measurements are inhibited. The IMS measurement inhibit flag may be turned on or off using the INH:IMSMEAS input message.

### CAN'T ATTACH TO PT\_CMMSDP PORT

Was unsuccessful in connecting to the CMMSDP port. Seek assistance from field support group.

### GOT AN ABORT SIGNAL

Received an abort request or a fatal error occurred and CMMSDP should abort. Other output displayed on the ROP will detail the reason. Action to be taken depends on the cause of the abort.

SEE PROPRIETARY NOTICE ON COVER PAGE

**BAD DISP FIELD IN HFDT FOR history\_file\_name**

The disposition field in the history file descriptor table for the history file name record is not HFDT\_STOP or HFDT\_CONT. Use recent change to restore the table to its proper value or call technical support for assistance.

**BAD ACTION FIELD IN HFDT FOR history\_file\_name**

The action field in the history file descriptor table for the history file name record is not HFDT\_ADD or HFDT\_COPY. Use recent change to restore the table to its proper value or call technical support for assistance.

**ACTION FIELD IN HFDT FOR history\_file\_name MUST BE COPY**

The action field in the history file descriptor table for a non-repeatable history file must be ADD\_COPY. Use recent change, to change the record setting the action to "copy" or call technical support for assistance.

**CANNOT FORK FOR report\_name**

CMMSDP cannot fork a copy of itself. This error usually occurs if memory space is limited and there is not enough left for a copy of CMMSDP. Seek technical assistance.

**INVALID SCHD ENTRY report\_name**

A history file table (HFDT) entry for the history file name in the source field of the schedule report record (in the scheduler table SCHD) does not exist. Use recent change to add the history file entry or call technical support for assistance.

**THE FILE file\_name IS NOT UPDATED**

The file named in the message could not be created and the measurements could not be accumulated. This indicates that disk space did not exist for the file. Seek technical assistance.

**FCODE fault\_code**

The fault code received by the fault handler was not FLT\_SINIT. Seek technical assistance.

**UPDATE TE: BAD PROTO protocol LINK link\_no TE NOT UPDATED**

The protocol for the link specified was not 7 (CCS 7), 8 (D Channel), or 9 (SADC). Verify the link data and recent change if necessary. Call technical support for additional assistance.

**OUT OF PER NODE MEAS BLOCK**

The match blocks are all in use. This is a critical error. Seek technical assistance.

**BAD PROTO protocol IN file\_name RNA ring\_node**

The protocol of the link specified as read from the file was not 7 (CCS 7), 8 (D Channel), or 9 (SADC). Verify the link data and recent change if necessary. Call technical support for additional assistance.

**CANNOT CREATE file\_name WITH MODE mode**

The file name specified could not be created and the data could not be accumulated. The disk space is not sufficient for the data to be stored. Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

**CANNOT EXECUTE file\_name**

The CMMSDP process forked off could not be overlaid with its child process CMNRGEN to produce a measurement report. This indicates there is not enough memory swap space available. Seek technical assistance.

**CANNOT GET PID CONNECTED TO PORT port\_number**

The process ID for the CNIINIT process could not be retrieved. Therefore, the required event could not be sent to CNIINIT which should time out. Seek technical assistance.

**CANNOT OPEN file\_name MODE mode**

The file specified could not be opened. If the priority of action is MAJOR, the file should exist and technical assistance should be sought. If the priority of action is NONE, the file will be created.

**CANNOT LOCK PROCESS IN MEM. FLAG flag\_number**

The CMMSDP process could not be locked in memory (flag\_number is 1) for dart purposes. No action is required.

**CANNOT READ file\_name**

The file specified could not be read. Seek technical assistance.

**CANNOT SEND TO PID process\_id EVENTS Xevent\_number**

An event could not be sent to the CNIINIT process which should time out. Seek technical assistance.

**CANNOT SET TRAP FOR SIGNAL signal\_number**

CMMSDP failed to set a trap for the specified signal. Should this signal be received, the process would terminate. Seek technical assistance.

**CANNOT WRITE file\_name**

The file specified could not be written. Seek technical assistance.

ID ..... REPT:CMRCV  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

This message has six output formats:

- [1] REPT CMRCV  
PROCESSING RC ORDER OF TYPE a
- [2] REPT CMRCV  
RC ORDER COMPLETE
- [3] REPT CMRCV  
UNABLE TO PCREAT CMRCVK, ERRNO = b
- [4] REPT CMRCV  
CAN'T OPEN c DISK FILE
- [5] REPT CMRCV  
RESPONSE = OPEN FAIL
- [6] REPT CMRCV  
CMRCV IS ABORTING

## 2. REASON FOR OUTPUT

Format 1 indicates that the CNI is beginning to activate the recent change request.

Format 2 is a completion report for recent change activation.

Format 3 indicates an error occurred during an attempt to create the process CMRCVK.

Format 4 indicates an error occurred during an attempt to open a disk file.

Format 5 indicates the recent change failed because of errors during attempts to open disk files.

Format 6 indicates that CMRCV is terminating due to the receipt of a SIGTERM signal.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Type of recent change requested:
- 55 — Add entries to the Critical Event Table.
  - 56 — Delete entries from the Critical Event Table.
  - 57 — Update entries in the Critical Event Table.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 58 — Add entries to the History File Descriptor Table.
  - 59 — Delete entries from the History File Descriptor Table.
  - 60 — Update entries in the History File Descriptor Table.
  
  - 61 — Add entries to the Scheduler Table.
  - 62 — Delete entries from the Scheduler Table.
  - 63 — Update entries in the Scheduler Table.
  
  - 64 — Add an entry to the Exception Table.
  - 65 — Delete an entry from the Exception Table.
  - 66 — Change an entry in the Exception Table.
  
  - 67 — Add an entry to the User View Descriptor Table.
  - 68 — Delete an entry from the User View Descriptor Table.
  - 69 — Add measurements to an entry in the User View Descriptor Table.
  - 70 — Delete measurements from an entry in the User View Descriptor Table.
  
  - 94 — Update the Critical Event Table on disk.
  - 95 — Update the Exception Table on disk.
  - 96 — Update the History File Descriptor Table on disk.
  - 97 — Update the Scheduler Table on disk.
  - 98 — Update the User View Descriptor Table on disk.
- b Error number as described in the System Error Codes Appendix, APP:SYSERR.
- c The disk file which could not be opened:
- /datamp/cni/odata/cet — Critical Event Table.
  - /datamp/cni/odata/excp — Exception Table.
  - /datamp/cni/odata/hfdt — History File Descriptor Table.
  - /datamp/cni/odata/schd — Scheduler Table.
  - /datamp/cni/odata/uvdt — User View Descriptor Table.

#### 4. ACTION TO BE TAKEN

If the output message has Format 3, 4, or 5, the recent change order has failed. The error messages can be examined via the **error** option of the **adm** command under the recent change system. For Format 3, also refer to the error code as described in the System Error Codes Appendix, APP:SYSERR.

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT COAMS CAU ABORTING CORE DUMP  
ETABLE: a

## 2. REASON FOR OUTPUT

A total of 128 LIBC buffers are allocated when a COAMS CAU session comes up. LIBC 0 buffer is used by the RTR IODRV. LIBC buffers 1 through 127 are used by the session. Each time a message is read or written, a LIBC buffer is allocated. If the read/write buffer descriptor is not marked "DONE" by the RTR IODRV, that particular LIBC buffer is lost forever. If LIBC buffers 1 through 127 are all still outstanding, all system resources are gone for this particular session. The session has to be torn down. A core dump is requested in order to verify that all LIBC buffers for the session were in fact still outstanding.

## 3. VARIABLE FIELD DEFINITIONS

a RTR system explanation

## 4. ACTION TO BE TAKEN

To dump data for the start of the LIBC buffers, enter the following:

DUMP:UID X'726,ADDR X'660A04,L 128!

Redial to start another session if necessary.

GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT COAMS CAU IO WRITE BUF (a) LOST

## 2. REASON FOR OUTPUT

Before the COAMS CAU session can process the next output message, it must check to see if the write buffer descriptor is marked done by the RTR operating system. If a write buffer descriptor is still outstanding, then the next output message will not get processed until the time exceeds one minute or the write buffer descriptor is marked done, whichever comes first. If the time exceeds one minute and the write buffer descriptor is still outstanding, the write buffer descriptor is idled by COAMS CAU. This allows the next output message to be received and processed. Note, when a write buffer descriptor is not marked done, that buffer descriptor is lost for the length of the session.

## 3. VARIABLE FIELD DEFINITIONS

a LIBC asynchronous write buffer descriptor number (1-127).

## 4. ACTION TO BE TAKEN

None.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

**1. FORMAT**

REPT COAMS CAU OUTPUT MSG TOO LONG

**2. REASON FOR OUTPUT**

Because the COAMS CAU session collects multiple lines of output to build an output message, a check is made to see if a threshold has hit. If the output message buffer has exceeded 1024 characters, then no more lines will be collected for the particular output message. At most, 1023 characters will get sent to the CAU CS because the EOM character has to be included as part of the output message.

## 1. FORMAT

REPT COAMS OUTDIR NSC a ERR b(c) UCB d(e)

## 2. REASON FOR OUTPUT

OUTDIR receives a failure from a DLNSC read command. This message conveys the type of read failure experienced. Every fourth read failure is reported to process INDIR. INDIR may remove/restore the datalink if five failures occur. If the DLNSC is not active, the OUTDIR process terminates. If the DLNSC is active, the link is closed, reopened, and processing continues.

## 3. VARIABLE FIELD DEFINITIONS

- a                   Frame number ranging from 1 - 127.

APPLICATION .. 4E  
TYPE ..... Output

### 1. FORMAT

REPT COAMS OUTDIR NSC a OUTPUT BLOCKED  
DATALINK RESTORED

### 2. REASON FOR OUTPUT

This message prints whenever OUTDIR receives part of an NSC user output message and has waited more than 30 seconds for additional output from the TN74 board. A timer is set to check for this particular error condition every five minutes. The data link for this NSC is restored in an attempt to clear the problem. The NSC output message that was hung up on the TN74 board is lost forever.

### 3. VARIABLE FIELD DEFINITIONS

a                      NSC frame number.

### 4. ACTION TO BE TAKEN

If too many of these error messages print out, the TTYC (controller) for the NSC frame data link can be removed to repump the TN74 board by entering the following:

RMV:TTYC a[;UCL]!  
where a = 18 through 31

SEE PROPRIETARY NOTICE ON COVER PAGE

TTYC mapping table for NSC frame data links:

| TTYC    | DATA LINK | LOGICAL CHANID | FRM TYPE |

SEE PROPRIETARY NOTICE ON COVER PAGE

|         |          |   |      |
|---------|----------|---|------|
| TTYC 29 | DLNSC 71 | W | DSDC |
|         | DLNSC 69 | U | DSDC |
| TTYC 31 | DLNSC 67 | 8 | DSDC |
|         | DLNSC 65 | 9 | DSDC |

**NOTE:** NSC frame data links are protected from inadvertent removal because each TTYC controls a pair of NSC frame data links. If either NSC frame data link of a pair is active, the remove input message is not allowed. The UCL is optional and can be used **ONLY** when absolutely necessary, because NSC user output message processing will get disrupted if its frame data link mate is active.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT COAMS OUTDIR a b c SIG d(e) UCB f(g)

## 2. REASON FOR OUTPUT

OUTDIR receives an asynchronous system signal associated with an NSC datalink. An analysis routine is called to determine the state of the datalink. The input director (INDIR) is notified only if the signal is associated with a datalink. If the datalink is not active, the OUTDIR process terminates.

## 3. VARIABLE FIELD DEFINITIONS

- a Frame name (e.g., NSC).
- b Frame number ranging from 1 - 127.
- c DIES if variable g is not equal to ACT, else variable c does not print.
- d System signal number.
- e System signal name for common signals:

| String        | Signal                                        |
|---------------|-----------------------------------------------|
| HANGUP        | 1 The datalink has been removed from service. |
| INTERRUPT     | 2 An interrupt (break).                       |
| QUIT          | 3 An ASCII "quit" character was received.     |
| SHELL RELEASE | 23                                            |
| ACK TO        | 24 Ack timeout - 5 seconds.                   |
| INTER CHAR TO | 25 Inter-character timeout - 45 seconds.      |
| ABANDON       | 26 An ASCII "abandon" character was received. |
| UNK SIG       | Other values of d.                            |

- f DLNSC unit control block status from the incore ECD:
  - 0 — Active.
  - 1 — Stand-by.
  - 2 — Unavailable.
  - 3 — Offline.
  - 4 — Out of service.
  - 5 — Unequipped.
  - 6 — Initializing.
  - 7 — Growth.

## 1. FORMAT

REPT COAMS OUTDIR a b TOSS FAILURES  
NSC\_TO\_OSM Q SUCC: c  
NSC\_TO\_OSM Q FAIL: d

## 2. REASON FOR OUTPUT

This message prints whenever a TOSS message cannot be forwarded to process NSC\_TO\_OSM, but no faster than once every five minutes. When the report is printed, the counters are zeroed. When the datalink is restored, the counters are zero (a new OUTDIR process is started).

Process NSC\_TO\_OSM is started by AIM and should be on software port PT\_OSM (94). Queue failures for NSC\_TO\_OSM could indicate the process is either not in core or is locked up and must be restarted.

## 3. VARIABLE FIELD DEFINITIONS

- a UCB name (eg., NSC).
- b UCB number (eg., 4).
- c Number of successful TOSS messages queued to NSC\_TO\_OSM.
- d Number of TOSS messages that failed to be queued to NSC\_TO\_OSM (this could indicate that process NSC\_TO\_OSM is not running or is locked up).

## 4. ACTION TO BE TAKEN

OP:STATUS:PORTS! to see if port number 94 is busy.  
OP:STATUS:PROCESS,ALL! to see if process NSC\_TO\_OSM is running.  
OP:AIM;PROC "nscosm"! to see if process NSC\_TO\_OSM is running.  
EXC:AIM;PROC "nscosm"! to start process NSC\_TO\_OSM.

## 1. FORMAT

This message has nine output formats:

- [1] REPT CNIDBA  
PROCESSING RC ORDER OF TYPE a
- [2] REPT CNIDBA  
RC ORDER COMPLETE
- [3] REPT CNIDBA  
RC DISK UPDATE COMPLETE
- [4] REPT CNIDBA  
RC DISK UPDATE FAILED
- [5] REPT CNIDBA  
RC UPDATE FAILED
- [6] REPT CNIDBA  
RC ERROR CHECKS FAILED
- [7] REPT CNIDBA  
RC DISK ERROR CHECKS FAILED
- [8] REPT CNIDBA  
b
- [9] REPT CNIDBA  
CNIDBA IS ABORTING

## 2. REASON FOR OUTPUT

Format 1 indicates that the CNI is beginning to activate the recent change request.

Formats 2 and 3 are completion reports for recent change activation in the 3B and disk files, respectively.

Format 4 is a report of failure to activate the recent change request in the disk file. It is followed by output message(s) of Format 8.

Format 5 is a report of failure to activate the recent change request in the 3B file. It is followed by output message(s) of Format 8.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 6 and 7 are reports of failed error checks for recent change activation in the 3B and disk files, respectively. It is followed by output message(s) of Format 8.

Format 8 is a report which describes the cause of the failed recent change activation. This failure may be caused by failed error checks or problems with the disk files.

Format 9 is a report of the successful termination (by the application) of an old CNIDBA process. Output messages of Format 9 should occur quite infrequently.

### 3. VARIABLE FIELD DEFINITIONS

- a                      Type of recent change requested:
- 100 — Link data recent change (3B computer and nodes).
  - 101 — Adding a virtual link assignment (3B computer).
  - 102 — Deleting a virtual link assignment (3B computer).
  - 103 — Changing the office ID data (3B computer and nodes).
  - 104 — Adding the office ID data (3B computer and nodes).
  - 121 — Updating a member in a local populated cluster (3B computer).
  - 122 — Adding a local populated cluster (3B computer).
  - 123 — Updating a remote populated cluster (3B computer).
  - 124 — Use linkset routing for a PC (3B computer).
  - 125 — Use combined linkset routing for a pc (3B computer).
  - 127 — Update the subsystem tables (3B computer and node).
  - 128 — Delete a subsystem (3B computer and nodes).
  - 129 — Adding permanent relations (3B computer).
  - 130 — Removing permanent relations (3B computer).
  - 131 — Deleting a pc and associated permanent relations (3B computer).
  - 132 — PBX link data recent change on node basis (3B computer and nodes).
  - 133 — PBX link data recent change on a per link basis (3B computer and nodes).
  - 137 — Update the broadcast list table.
  - 138 — Adding international routing data.
  - 139 — Removing international routing data.
  - 140 — Changing international routing data.
  - 141 — Adding a network identifier.
  - 142 — Deleting a network identifier.
  - 143 — Updating a combined linkset.
  - 144 — International link data recent change (3B computer and nodes).
  - 145 — Changing the global title translation table.
  - 146 — Deleting entries from the global title translation table for a particular service.
  - 147 — Adding/Deleting entries for small network populated cluster.
  - 201 — Copy the logical physical tables to disk
  - 202 — Update the office id data on disk
  - 203 — Update the link data on disk for a given link

SEE PROPRIETARY NOTICE ON COVER PAGE

- 209 — Copy the cluster/ member routing info to disk.
- 210 — Update the subsystem disk files.
- 211 — Update the permanent relations disk file.
- 212 — Update the broadcast list disk file.
- 213 — Update the international link data on disk for a given link.
- 214 — Update the network interconnect data on disk.
- 215 — Updates the global title translation data on disk.

b                      Text string describing the failed error checks.

#### **4. ACTION TO BE TAKEN**

For Formats 1, 2, and 3, no action is required.

For Formats 4, and 5, the problem should be corrected and the recent change reentered.

For Formats 6, and 7, no action is required if the recent change was originated from a remote site. However, if the recent change was originated locally, the erroneous data should be corrected and the recent change reentered.

Format 8 describes the cause of the failed recent change activation noted by an output message of Format 4, 5, 6, or 7.

For Format 9, no action is required.

## 1. FORMAT

- [1] REPT CNIER  
CRITICAL EVENTS LOST BY CE BUFFER OVERFLOW:a
- [2] REPT CNIER  
CRITICAL EVENTS LOST BY CONTENTION:b
- [3] REPT CNIER  
CRITICAL EVENTS LOST  
CE BUFFER OVERFLOW:a;CONTENTION:b

## 2. REASON FOR OUTPUT

**NOTE:** At intervals of five minutes, the CNIER process issues one of these messages if, in the interval just past, at least one attempt to generate a Critical Event (CE) message failed. The length of an interval can exceed five minutes; the interval continues past the five minute mark until the next time the CNIER process runs.

Format 1. One or more attempts by the SLMK process to generate a critical event message failed because the critical event buffer was full.

Format 2. One or more attempts by an application process to generate a critical event message failed because the SLMK process had a lock on the critical event buffer for the purpose of writing a critical event message of its own.

Format 3. Both of the events occurred.

## 3. VARIABLE FIELD DEFINITIONS

- a Number of times in a 5-minute interval that an attempt to generate a critical event message failed because the critical event buffer was full.
- b Number of times in a 5-minute interval that an attempt to generate a critical event message failed because the SLMK process had a lock on the critical event buffer.

SEE PROPRIETARY NOTICE ON COVER PAGE

## **2. REASON FOR OUTPUT**

The REPT:CNIINIT message originates from the CNIINIT process. This message may be output because of errors in CNI detected by CNIINIT, errors internal to CNIINIT itself, or status information.

Format 1 identifies the current CNI generic.

Format 2 is output when all CNIINIT child processes have been created. It should be considered a benchmark during initialization. Note that this message is not used in later generics.

Format 3 is output when the user fails to send CNIINIT the message to begin the Non-critical initialization. CNIINIT has "timed out" and started the Non-critical initialization on it's own.

Format 4 provides state information about CNIINIT when a UNIX®-RTR system fault is received by CNIINIT. These values are assigned and defined by UNIX®-RTR system.

Format 5 provides additional state information following a UNIX®-RTR fault.

Format 6 is printed when the CNIINIT process receives a UNIX®-RTR system message in which the message type is not recognized.

Format 7 is printed when the CNIINIT process receives a UNIX®-RTR system acknowledgement message that contains an error. Acknowledgement messages are expected following process creations.

Format 8 is printed when CNIINIT has nearly completed an abort sequence. CNIINIT has requested the termination of all it's child processes and is about to request termination of its self from the operating system.

Formats 9-12. Some combination of these messages can be printed when CNIINIT is dumping state information. The information concerns state and status information kept by CNIINIT about its child processes. In general, these messages will appear very rarely.

Format 13 is printed when CNIINIT is unable to detect a CNI USER Process at boot time. CNIINIT makes the assumption that it is in a lab and follows through with the initialization on its own. This message should not appear in a field site, if it does, it should be considered an error.

Either format 14 or 15 can be printed when CNIINIT is having difficulty recreating a child process. Typically, CNIINIT will reschedule another attempt for later. In some cases, the message will indicate the minimum amount of time that must pass before another attempt can be made.

Either format 16 or 17 can be printed when CNIINIT times out while (re)creating a child process. Typically, CNIINIT will reschedule another attempt for later. However, if the process that was being (re)created was of a critical nature, then a boot initialization may occur.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 18 is printed when CNIINIT is beginning some form or level of initialization. The meaning of the message should be self-evident.

Format 19 is printed when CNIINIT completes some form or level of initialization. The meaning of the message should be self-evident.

Format 20 is printed when CNIINIT is unable to complete some form or level of initialization. This could mean that initialization and recovery activities are considered complete, but call handling may not be working.

Format 21 is printed when the Non-critical initialization sequence was interrupted for some other level of initialization. The Non-critical initialization will be completed at a later time.

Information output by CNIINIT may not be useful to the user. This information is intended for use by development/support personnel when diagnosing CNIINIT errors or faults.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                                  |
|---|--------------------------------------------------------------------------------------------------|
| a | Present CNI Generic.                                                                             |
| b | Value of the realtime clock at the time the message was generated.                               |
| c | The UNIX® RTR fault code.                                                                        |
| d | The location (relative address) CNIINIT was executing at when the fault occurred.                |
| e | A value representing the event flags (kevent) at the time the fault occurred.                    |
| f | A value representing the contents of the CNIINIT process Program Status Word (PSW).              |
| g | A value representing the contents of the CNIINIT process Primary Segment Base Register (PSBR).   |
| h | A value representing the contents of the CNIINIT process Secondary Segment Base Register (SSBR). |
| i | General purpose registers (regs 0 - 11).                                                         |
| j | The Process ID (PID) of the process that sent the message to CNIINIT.                            |
| k | The Process ID (PID) of the receiving process. (CNIINIT)                                         |
| l | The message flags.                                                                               |
| m | The message type.                                                                                |
| n | The message status field.                                                                        |
| o | The old message type.                                                                            |
| p | The identification field.                                                                        |

SEE PROPRIETARY NOTICE ON COVER PAGE

|    |                                                                                                                                                                       |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| q  | The "state" that CNIINIT's finite state machine was in at the time the message was printed.                                                                           |
| r  | The "state" that CNIINIT's finite state machine was in PRIOR to the current state.                                                                                    |
| s  | Index into CNIINIT's child process table. It points to the entry of one of CNIINIT's child processes.                                                                 |
| t  | Full pathname of the child process pointed to by s.                                                                                                                   |
| u  | Timeout value 1, used by all child processes, this is the primary timer value for each process. It is used for process creation timing and general handshake timing.  |
| v  | Timeout value 2, used only by the child process "imsdrv.p". It guards the entire boot sequence (early generics) or the critical portion of the boot (later generics). |
| w  | Timeout value 3, used only by the child process "imsdrv.p". It guards the non-critical boot sequence.                                                                 |
| x  | The PID of the child process identified by s.                                                                                                                         |
| y  | A value representing the timer id or tid of the process identified by s.                                                                                              |
| z  | The "process state" of the process identified by s.                                                                                                                   |
| a1 | A forward link or index in the process table that points to the next process to be created.                                                                           |
| b1 | A forward link or index in the process table that points to the next process to receive the "START_PROC" event.                                                       |
| c1 | A forward link or index in the process table that points to the next process to receive the "STOP_PROC" event.                                                        |
| d1 | A value the represents the "recreation type" of the process.                                                                                                          |
| g1 | The p-name of the child process pointed to by s.                                                                                                                      |
| e1 | A forward link or index in the process table that points to the next CRITICAL process to be created.                                                                  |
| f1 | A forward link or index in the process table that points to the next NON-CRITICAL process to be created.                                                              |
| h1 | A forward link or index in the process table that points to the next process to receive the "STOP_PROC" or "START_PROC" event.                                        |
| i1 | The utility ID of the process identified by s.                                                                                                                        |
| j1 | A value representing the "track flags" of the process identified by s.                                                                                                |
| k1 | One of the phrases:<br>will retry later<br>Retry in l1 s                                                                                                              |

SEE PROPRIETARY NOTICE ON COVER PAGE

Will retry in l1 seconds

l1           The minimum number of seconds until the process is retried.

m1           Is some combination of the following words and phrases:

                    CRITICAL  
                    NON-CRITICAL  
                    [MINMODE]  
                    level 0  
                    level 1  
                    level 2  
                    level 3  
                    level 4

#### 4. ACTION TO BE TAKEN

Formats 1,2,3: Informational only, take no action.

Formats 4,5,6,7,8,9,10,11,12,13: Valuable information pertaining to the fault or error that just occurred. This information should be submitted to technical support personnel at AT&T Bell Laboratories in Columbus, Ohio, for further analysis.

Formats 14,15,16,17,18,19: Verify that the process in question (k1) is eventually recreated.

Format 20: Appropriate tests should be made to see if call handling is functional. If it is, then the message can be ignored. If call handling is not functional, then the next higher level of initialization should be manually initiated. In any case, the information should be submitted to technical support personnel at AT&T Bell Laboratories in Columbus, Ohio, for further analysis.

Format 21: Insure that the Non-critical initialization eventually completes. This can be determined by the presence of the "COMPLETES NON-CRITICAL" message, by full functionality of the CNI display pages and CNI measurements. If the non-critical sequence does not complete, then the next higher level of initialization should be initiated during a period of low traffic.

MSG i: j k l m n o p q r s  
MSG i: j k l m n o p q r s

## 2. REASON FOR OUTPUT

Format 1 reports the occurrence of an internal problem or bug.

Format 2 reports that a fault message was received by the IMS driver process. This message will normally be associated with a REPT:IMSDRV-FLT message and some versions of the REPT:FAULT message.

Format 3 reports details of a FLT\_QMSAUD fault received by the IMS driver process. This message will normally follow a Format 1 message.

This fault type complains of UNIX® RTR message buffers held for an unreasonable length of time.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                          |
|---|------------------------------------------------------------------------------------------|
| a | Name of the process which experienced the trouble.                                       |
| b | Name of the source code file where trouble occurred.                                     |
| c | Source code line number where trouble occurred.                                          |
| d | Short statement describing the trouble or conditions existing when the trouble occurred. |

| f | Device UCB record identification.                                                               |
| g | Error number passed from Error Interrupt Handler (EIH).                                         |
| h | Old message count.                                                                              |
| i | A consecutively assigned number starting from 1 to associate the continuations in proper order. |
| j | Sending process number.                                                                         |
| k | Receiving process number.                                                                       |
| l | Message size (including header) in blocks.                                                      |
| m | Message header flags. (See UNIX® RTR msghdr.h.)                                                 |
| n | Message type.                                                                                   |
| o | Message status.                                                                                 |
| p | Message size (including header) in bytes specified by sender.                                   |
| q | Original message type of an acknowledgement message.                                            |
| r | Message sequence number.                                                                        |
| s | Message identification used by sender.                                                          |

#### 4. ACTION TO BE TAKEN

If the message does not match Format 2 or 3, technical assistance should be requested.

Format 2 supplements the REPT:IMSDRV-FLT message and should be analyzed with that message and the accompanying REPT:FAULT message.

Format 3 indicates software problems. Seek technical assistance.

Each line identified by MSG shows the contents of the report message header of a message which was held too long. The nature of these messages may implicate particular software modules.

ID ..... REPT:CONFIG  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT CONFIG FAULT TYPE a UNIT = b PID = c ASSERT = d
- [2] REPT CONFIG FAULT TYPE a INACCESSIBLE RID = e PID = c  
ASSERT = d

## 2. REASON FOR OUTPUT

To report a fault condition in the configuration (CONFIG) library.

Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

## 3. VARIABLE FIELD DEFINITIONS

- a One or more fault types:
- AMB — Could not allocate a message buffer.
  - CI — CONFIG internal failure.
  - EA — Equipment Configuration Database (ECD) access problem.
  - ED — ECD data invalid.
  - FSM — Could not fault a process or send a message to a process.
  - IA — Possible invalid argument.
  - PA — Plant measurements database access problem.
  - PS — Unit in protected state.
- b Name and number of unit.
- c Process number of the process which called the CONFIG function.
- d Identification number (ASSERT number) of the fault in CONFIG.
- e Record ID (RID) of the Unit Control Block (UCB) record in the ECD of the unit.

## 4. ACTION TO BE TAKEN

Consider bootstrapping for fault types EA, ED, and PA. Fault types AMB and FSM suggest that the system is in overload. In all cases, save a copy of the output message and seek technical assistance.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT CONFIG RECONFIGURATION TYPE a UNIT b PID = c

## 2. REASON FOR OUTPUT

To report a successfully executed reconfiguration requested by CONFIG when the indicated unit has exceeded an error threshold and cannot be removed or replaced.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Reconfiguration type (or action):  
                             SWCU — Softswitch.
- b                      Name and number of the unit causing reconfiguration.
- c                      Process Identification (ID) of the process calling CONFIG.

## 4. ACTION TO BE TAKEN

The softswitch will eliminate the errors associated with the indicated unit only if the error sources are in the Direct Memory Access (DMA) or the Dual Serial Channel (DSCH) subunits of the now standby Control Unit (CU), or in the Duplex Dual Serial Bus Selector (DDSBS) of the unit. If this is the case repair the appropriate DMA, DSCH, or DDSBS.

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has six formats.

- [1] REPT COPY PBUF (dmptable) COMPLETED  
PBUF INCORE HASHSUM = a
- | TYPE | UID | PID | VADDR | PADDR | PHY_DATA | OLD_DATA | NEW_DATA |
|------|-----|-----|-------|-------|----------|----------|----------|
| b    | c   | d   | e     | f     | g        | h        | i        |
- [2] REPT COPY PBUF ABORTED - j
- [3] REPT COPY PBUF COMPLETED
- [4] REPT COPY PBUF (rptable) CANNOT OPEN k
- [5] REPT COPY PBUF (rptable) OUTDATED OWBUFFER DATE = l
- [6] REPT COPY PBUF (rptable) INVALID OWBUFFER

## 2. REASON FOR OUTPUT

Format 1 indicates the data values resulting from successful copy of data in 3B diskfile.

Format 2 is a general format of information due to errors detected. This information is meant to be self-explanatory.

Format 3 indicates completion of command.

Formats 4 through 6 indicate that a problem exists in reading the DISKFILE or a problem exists with the data entries.

## 3. VARIABLE FIELD DEFINITIONS

- a Calculated hashsum over all overwrite entries.
- b Overwrite type (UID, PID, PMEM, or KERN).
- c Utility ID of process overwritten.
- d Process ID of process overwritten.
- e Virtual address to be overwritten, corresponding to overwrite type.
- f Physical address to be overwritten, corresponding to overwrite type.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                           |
|---|---------------------------------------------------------------------------|
| g | Physical data value; actual data value of address before overwrite.       |
| h | Old data value; default value is (ffffff) if OLDDATA option was not used. |
| i | New data value.                                                           |
| j | Supplemental data describing the problem found.                           |
| k | Indicates DISKFILE name.                                                  |
| l | Indicates date of outdated owbuffer.                                      |

#### **4. ACTION TO BE TAKEN**

All DISKFILE failures should be reported to the Technical Support Organization.

## 2. REASON FOR OUTPUT

To report errors detected by the spooler during initialization.

When formats having no key value are printed, other output messages may then appear in primitive mode.

Format 1 is printed if the Equipment Configuration Database (ECD) contains inconsistent device definitions.

Formats 2 and 9 are printed if the ACKDB failed to initialize from disk, or could not be added to the invoking process' address space.

Formats 3, 16, and 21 are printed if Coordinator Of Spooler Output Processes (CSOP) cannot access the plant measurements database.

Formats 4, 5, 7 through 10, 13, 14, 15, 17, and 18 are printed if errors occur while trying to read an Output Message Data Base (OMDB) into memory.

Format 6 is printed if there is an inconsistency in the ECD device definition. Either the terminal should be a dialogue device and is not, or the SOP should be temporary and is not.

Format 11 is printed if CSOP fails to save the stack in preparation for handling a phase 1.

Format 12 is printed if CSOP is unable to create a dialogue shell.

Format 19 is printed if CSOP cannot remove the output file associated with Format 21.

Format 20 is printed if CSOP cannot send a message to SOP process Identification (ID) listed.

Formats 22 and 27 are printed if CSOP cannot open or write the output file.

Format 23 is printed when CSOP creates a new spooler output process.

Format 24 is printed when a device record is deleted in the ECD.

Formats 25 and 29 are printed when CSOP is unable to create a new spooler output process.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 26 is printed if CSOP is unable to print to the Read Only Printer (ROP).

Format 28 is printed if CSOP is unable to remove a file.

Format 29 is printed if CSOP is unable to fork a SOP process.

Formats 30, 43, 44, and 59 indicate a SOP work queue error. In the case of 43, the locations and addresses of the message headers are printed.

Format 31 is printed if memory cannot be allocated for CSOP's master work queue. This is a fatal error since no messages can be stored internally for later output.

Formats 32, 45 and 46 are printed when CSOP is unable to queue incoming messages; therefore, messages will be lost.

Format 33 is printed when the overload condition has been cleared.

Format 34 is printed if CSOP is unable to enable the reception of messages.

Format 35 is printed when a new device record is defined in the ECD.

Format 36 is printed if a class is defined that contains no output devices.

Format 37 is printed when there was no entry in the work queue for a.

Formats 38 and 41 are printed when a dialogue shell is terminated.

Format 39 is printed if port 1 is not free. CSOP will attempt to kill the process that is attached to port 1 and connect itself.

Format 40 is printed when the ECD record for a device or class is changed.

Format 42 is printed when a dialogue shell is created.

Format 47 is printed if the queue size for a device changed and it is not large enough to hold all the current outstanding messages.

Format 48, 49, and 57 indicate ECD record problems.

Format 50 is printed if CSOP cannot get enough memory to store the definition of an output device.

Format 51 is printed when CSOP does not have enough memory to store the definition of a class.

Format 52 is printed if CSOP is unable to allocate memory for the work queue associated with a particular SOP.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 53 is printed if CSOP was unable to attach to the ECD. If this appears before CSOP initializes the master work queue, the message will go to the spooler log until CSOP is restarted.

Formats 53, 57, and 58 indicate ECD access and/or update errors.

Format 54 is printed when the common segment to exchange work queue information between CSOP and SIP cannot be created.

Format 55 is printed when CSOP is unable to allocate space to store information about a new tty entry.

Format 56 is printed when a tty entry is requested to be removed from CSOP's internal tty list, and CSOP cannot find an entry for the specified device or class.

Format 59 is printed by CSOP when it is cleaning up after a dead SOP if it cannot find a tty entry associated with the SOP.

Format 60 is printed when CSOP finds that the output file is not empty. This is done to ensure that existing files are not destroyed or inappropriately changed.

Formats 61 and 62 indicate that a state change has occurred in the system; output is redirected to the spooler log. Format 61 indicates that the system is in the SIMPLEX mode, and Format 62 indicates that the system is in DUPLEX mode.

Format 63 indicates that CSOP has run out of common segment space. This space is used to store output messages that are being formatted or formatted messages that have not yet been output.

Format 64 indicates that CSOP cannot retrieve the name of a file from its common segment. CSOP needs the filename so that the file can be removed.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                            |
|---|------------------------------------------------------------|
| a | Name of an output device or class.                         |
| b | Reason a device could not be added to CSOP's device table. |
| c | File name.                                                 |
| d | Process Identification (ID) of SOP.                        |
| e | System error number.                                       |
| f | String containing additional information.                  |

|   |                                                                                     |
|---|-------------------------------------------------------------------------------------|
| k | String identifying where data is stored. NO TEXT indicates there is no data stored. |
| l | Address in CSOP's common segment.                                                   |
| m | Error number assigned by CSOP.                                                      |
| n | Spooler output class.                                                               |
| o | Maximum number of active OMDB segments.                                             |
| p | Utility ID.                                                                         |
| q | OMDB key of the report.                                                             |

#### 4. ACTION TO BE TAKEN

For messages appearing on the Receive-Only Printer (ROP), in the event of a fatal fault, CSOP will be restarted, thus clearing the problem. No action should be taken unless the message is repeated. If the message is repeated, seek technical assistance to restore system sanity.

Messages written to the spooler log are informational only and no action should be taken.

If Format 19 is printed, the file should be removed manually.

If Format 60 is printed, determine the input command that specified this output file and retry that command with a different filename option.

If Format 64 is printed, if /tmp space is limited, check for files of the form "/tmp/OM\*" and remove any of these that do not have a time stamp within the last 6 hours. Note: there is one report of format 64 for each file to be removed.

#### 5. REFERENCES

##### OMDB Keys

Format 1 has an OMDB key of 599.

Formats 2, 4 through 11, 13, 14, 15, 17, 18, 31 through 34, 39, 45, 46, 50 through 54 and 63 do not have OMDB keys.

These are output messages that cannot be formatted and spooled due to the state of the system at the time of printing.

Formats 3, 12, 16, 21, 23, 24, 25, 28, 29, 35, 36, 38, 40, 41, 47, 49, and 55 through 58, 61 and 62 have an OMDB key of 201.

Formats 19, 22, 26, 27, 30, 44, 59, and 60 have an OMDB key of 202.

Format 20 has an OMDB key of 203.

Format 37 has an OMDB key of 204.

Format 42 has an OMDB key of 205.

Format 43 has an OMDB key of 206.

Format 64 has an OMDB key of 745.

## 2. REASON FOR OUTPUT

To report that an error has occurred during the formatting of a format-and-spool request.

All variables for REPT:CSOP-FORM messages are taken from the information passed by the requesting (client) process.

SEE PROPRIETARY NOTICE ON COVER PAGE

### **3. VARIABLE FIELD DEFINITIONS**

- a                      The key that was requested.
- b                      The process ID of the requesting process.
- c                      The utility ID of the requesting process.

### **4. ACTION TO BE TAKEN**

Formats 1 through 5 indicate a problem in requesting process code. Seek technical assistance.

Format 6 indicates that CSOP is unable to store the formatted text. CSOP will attempt to store the text in a file in /tmp if CSOP's common segment is full. This message indicates that the attempted use of a file failed.

Format 7 indicates a software problem with the Output Message Database (OMDB). Seek technical assistance.

Format 8 indicates a software error in the language passed to CSOP. Currently, there are two valid values, English and National, with English as the default. Seek technical assistance to resolve.

Format 9 indicates a failure in CSOP to allocate memory while processing the output message. This indicates that memory resources are temporarily unavailable resulting in the loss of the requested output message.

### **5. REFERENCES**

OMDB Key

Formats 1 through 9 have an OMDB key of 11.

## 1. FORMAT

REPT CSOP IN SERVICE  
OMDB SEGMENTS:  
TOTAL        ACTIVE  
a            b

## 2. REASON FOR OUTPUT

To report initialization of the Coordinator of Spooler Output Processes (CSOP) process.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                            |
|---|----------------------------------------------------------------------------|
| a | Total number of segments that the Output Message Database (OMDB) requires. |
| b | Number of segments that are active (incore).                               |

**NOTE:** The number of segments is variable depending on the current state of the system and the Equipment Configuration Database (ECD) setup. When the system is in DUPLEX mode, the number of active segments will be determined from the splrinfo record information in the ECD. When the system is in SIMPLEX mode, the number of active segments will be the total number of output buffer segments required by the OMDB.

## 4. ACTION TO BE TAKEN

None.

## 5. REFERENCES

## 1. FORMAT

REPT CSOP PRIMITIVE MODE FOR KEY a  
0xbbbb: cccccccc [cccccccc cccccccc cccccccc]

## 2. REASON FOR OUTPUT

To report that the Output Message Database (OMDB) cannot be accessed and therefore a message cannot be formatted. Variables passed by the requesting process are given in the form of a hexadecimal dump.

## 3. VARIABLE FIELD DEFINITIONS

|          |                                                                                                                                        |
|----------|----------------------------------------------------------------------------------------------------------------------------------------|
| a        | The key that is requested.                                                                                                             |
| bbbb     | The offset of the first byte of the line.                                                                                              |
| cccccccc | A hexadecimal dump of one memory word. (Due to limits of the primitive mode buffer, this may not be a complete dump of all variables.) |

## 4. ACTION TO BE TAKEN

Primitive mode indicates a problem in accessing the incore OMDB. Examine the current status of the file /cft/spl/omdb and disk availability. If the file exists and the disk is ACTIVE, execute the ACTV:OMDB input message. If this is not successful, the problem may be insufficient memory available to bring the OMDB incore; contact the next level of technical support.

**NOTE:** A cross reference file, *omdb.xref*, located on development support processors, is needed to translate the hexadecimal dump. Support personnel should refer to the *UNIX® RTR Programmer's Manual*, Volume 2, for instructions on translating hexadecimal OMDB dumps.

ID ..... REPT:CU  
WORK CENTER.. MOC  
GENERIC ..... 4AP16 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT CU a b
- [2] REPT CU a ERROR INTERRUPT c d
- [3] REPT CU a MAINTENANCE INTERRUPT d

## 2. REASON FOR OUTPUT

To indicate the status of the specified Control Unit (CU).

Format 1 is printed as the result of a change in the major state of the CU.

Formats 2 and 3 indicate that an error interrupt has occurred.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number (0-1).
- b Major state:
  - ACTIVE — Processor is on-line and not in a recovery state.
  - INITIALIZING — Processor has undergone an initialization, and the initialization interval has not elapsed.
  - OUT OF SERVICE — Processor is available for use, but its memory is not up-to-date.
  - REMOVED — Processor state has been changed to OUT OF SERVICE or UNAVAILABLE.
  - STANDBY — Processor is updated and available for use.
  - UNAVAILABLE — Processor is unavailable under any circumstance (for example, forced off-line).
- c Interrupt type, in hexadecimal notation:
  - 2 — Emergency Action Interface (EAI) error
  - 8 — Noncorrectable parity failure in main store (my store C)
  - 0B — Invalid maintenance channel order
  - 0C — Other store controller error (other store A)
  - 0D — Other store refresh or correctable parity failure (other store D)
  - 0E — Other store noncorrectable memory failure (other store C)
  - 0F — Other store timeout
  - 10 — Channel error
  - 11 — Input/Output (I/O) response error

SEE PROPRIETARY NOTICE ON COVER PAGE

- 12 — IO addressing error
- 13 — Parity divert error
- 14 — Refresh or correctable parity memory failure (my store D)
- 15 — Protection violation
- 16 — Virtual address out of range (VLMM only)
- 17 — Out-of-range memory reference
- 18 — Out-of-range memory reference (other store)
- 19 — Privilege violation
- 1A — Bad alignment on memory reference
- 1B — Illegal operand
- 1C — Illegal instruction
- 1D — Illegal stack switch
- 1E — No interrupt source set when microcode interrupt handler entered
- 20 — Direct Memory Access (DMA) detected fatal hardware fault in on-line main store
- 21 — DMA detected out-of-range memory reference
- 22 — DMA detected noncorrectable parity failure in main store
- 25 — DMA error: bad parity on Direct Input / Output (DIO) bus
- 26 — DMA error: bad parity on read
- 27 — DMA error: DMA Random Access Memory (RAM) parity failure
- 28 — DMA error: DMA incrementer parity failure
- 29 — DMA error: DIO ready failure
- 2A — DMA error: DIO all seems well failure
- 2B — DMA error: DIO acknowledge failure
- 2C — DMA error: Central Control Input/Output (CCIO) data parity failure
- 2D — DMA error: CCIO message failure
- 2E — DMA error: DMA Read Only Message (ROM) sequencer parity failure
- 2F — DMA error: Address error
- 30 — DMA error: Channel request error
- 32 — Processor error interrupt but no bits are set in error registers
- 33 — Bad Operating System Trap (OST) detected by the kernel

d If supplemental data is gathered for this error, it will be placed in the appropriate log file. This identification flag can be used to find the entry in the log file.

For format 2, the error data will be in either the ERLOG or MEMLOG log file. The log file name is given in the action to be taken for each interrupt type.

For format 3, the entry is always in the PMLOG file.

Items can be extracted from a log file using the OP:LOG input message, where ERLOG or MEMLOG is the log file being searched and the Keyword (KW) argument is the value of the sequence number given in this variable.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

If a Format 2 message is output, follow the appropriate instructions for the specified interrupt type as given:

- 2 — This interrupt occurs only on 3B21D machines. It indicates that an error has occurred on the on-line CC EAI circuitry. Analyze the accompanying REPT:ERSLOT output message and take appropriate action as stated.
- 8 — This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board.

Run all of the phases of the Main Store Controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

- 0B — If this is an isolated failure, no action is required. If repeated failures occur, the maintenance channel may have a fault. Check the cabling and run diagnostics. The error entry is in ERLOG.
- 0C — This error may implicate the store controller or a store array. Calculate the faulty store array and run diagnostics as for interrupt type 8. If there is no fault, restore the unit to service.
- 0D — This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board.

Run all of the phases of the Main Store Controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

- 0E — This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board.

Run all of the phases of the Main Store Controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

- 0F — Check the update cables and run diagnostics on the off-line main store and update circuits. The error data is in ERLOG.
- 10 — Get the channel number and channel address from the corresponding entry in ERLOG.

If the address corresponds to a 3x6 code, but the channel is unequipped, the database may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the database. If the error occurs on one

SEE PROPRIETARY NOTICE ON COVER PAGE

processor and not the other, run diagnostics on the processor that encounters the fault.

- 11 — Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as: channel address = (hardware status register).

If the address corresponds to a 3x6 code, but the channel is unequipped, the database may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the database. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.

- 12 — Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as: channel address = (hardware status register).

If the address corresponds to a 3x6 code, but the channel is unequipped, the database may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the database. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.

- 13 — Get the hardware status register from the corresponding entry in ERLOG. The channel address can be determined as: channel address = (hardware status register).

If the address corresponds to a 3x6 code, but the channel is unequipped, the database may contain an incorrect entry. If the address corresponds to a valid channel, run diagnostics on that channel and check the cabling. If the address does not correspond to a valid 3x6 code, check the database. If the error occurs on one processor and not the other, run diagnostics on the processor that encounters the fault.

- 14 — This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board.

Run all of the phases of the Main Store Controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

- 15 — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, program address (PA) and program status word (PSW), should be reported according to local procedures, including the error log data.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 16 — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 17 — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data. T}
- 18 — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 19 — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 1A — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 1C — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 1D — This is a software error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 1E — If repeated failures occur, run diagnostics on the processor encountering the fault. The error data is recorded in ERLOG.
- 20 — This error can occur only if hardware checks are blocked. The corresponding ERLOG entry contains the Direct Memory Access (DMA) store data register. This can be used to determine the bad memory location. Diagnose the main store if there are multiple errors of this type.
- 21 — This is a software error that was detected by the DMA and is a fatal DMA error. Obtain the entry from ERLOG concerning the error. Persistent errors, those implicating the same process as determined by utility ID, PA and PSW, should be reported according to local procedures, including the error log data.
- 22 — This error typically implicates a memory array board detected by the DMA and is a fatal DMA error. The error data is recorded in ERLOG. This error typically implicates a memory array board. Refer to the Error Analysis section of the *System Maintenance Manual*, to determine the faulty memory array board.

Run all of the phases of the Main Store Controller (MASC) diagnostics, including the demand phases. If a failure occurs, replace the faulty pack. If there is no

SEE PROPRIETARY NOTICE ON COVER PAGE

failure, but there are repeated errors, try rotating the pack to another slot to see if the error follows the pack.

- 25 — This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
- 26 — This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
- 27 — This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
- 28 — This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
- 29 — This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
- 2A — This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
- 2B — This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
- 2C — This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
- 2D — This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
- 2E — This is a DMA internal error. The corresponding entry in ERLOG contains data which may help in determining the error. Run diagnostics on the indicated DMA.
- 2F — This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
- 30 — This error is in a channel under the DMA, but is detected by the DMA. The corresponding entry in ERLOG indicates the channel which caused the error and gives the contents of its status register when the error occurred. Diagnose the channel if there are multiple errors.
- 32 — If this problem persists, diagnose the faulty CU. This can be an improperly wired interrupt source register. The error data is recorded in ERLOG.
- 33 — The kernel has detected a bad operating system trap. Identification of the offending process is possible by examining the ERLOG log file or the corresponding error data printed on the Receive-Only Printer (ROP).

SEE PROPRIETARY NOTICE ON COVER PAGE

For format 3 errors, refer to the *System Maintenance Manual* for analysis of maintenance interrupt data. The analysis is done similarly to the post mortem analysis with the additions:

- The source will always be software or hardware.
- For software sources, the utility ID and panic code determine the cause.
- For hardware sources, examine the MICROCODE SAVE STATE for
  - Stop and switch errors in the error register.
  - A one (1) in bits 6 or 7 of the Timer Register (TMR), indicating the sanity timer fired.
  - A micro-interrupt error with either the interrupts blocked (System Status Register [SSR]) or the execution at level 15 (PSW).

Any hardware error implicates the sanity of the faulty CU while, in general, software errors are caused by program malfunctions. However, any recurring error on one CU implicates that CU. Run diagnostics, including demand phases, if necessary.

| b | Name and number of unit.                                                                                                                  |                                                                      |
| c | Identification number (ASSERT number) of the fault in the CURSTRMV process. Useful only to 3B development seeking to resolve the problem. |                                                                      |
| d | Starting address of the memory block.                                                                                                     |                                                                      |
| e | Record ID (RID) of the Unit Control Block (UCB) record in the ECD.                                                                        |                                                                      |
| f | Microstore slot number of failing checksum.                                                                                               |                                                                      |

#### 4. ACTION TO BE TAKEN

Messages referring to a microstore pump failure, a physical memory pump failure, or an update failure generally indicate hardware problems with the off-line CU. If the message indicates the off-line CU is forced, clear the force from the Emergency Action Interface (EAI) page on the maintenance terminal. For the EMM type message, make sure the EMM straps are either on or off on both CUs. For other cases, save a copy of the output message and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

This message has two formats.

[1] REPT DADC SDL a CODE b

[2] REPT DADC MONITOR CODE b

## 2. REASON FOR OUTPUT

This message is output in response to an error in the DADC monitor process called DAmaster and DADC handler process called DAhandler.

## 3. VARIABLE FIELD DEFINITIONS

a SDL unit number.

b Abort code 1xx from DAmaster and 3xx from DAhandler:

- 103 — The API is not on its port.
- 104 — The open to the API failed three times.
- 105 — A release message was sent with a bad link number.
- 106 — DADC trying to send a message to a nonexistent process.
- 107 — PAS 10-second wait list is zero.
- 108 — PAS 4-second wait list is zero.
- 109 — Call Reference Number not in 4-second list.
- 303 — Message is not on the 4 or 10-second list.
- 304 — Message not on the 10-second list.
- 398 — The freelist is empty.
- 399 — The freelist element is out of range.

## 4. ACTION TO BE TAKEN

Seek technical assistance.

U\_DID NUMBER c OUT OF RANGE - b
- [6] REPT DB INIT ERR  
DUPLICATED U\_DID NUMBER c - b, d
- [7] REPT DB INIT ERR  
DUPLICATED PNI e - b, d

## 2. REASON FOR OUTPUT

A discrepancy was noted in the contents of the ECD records for equipped ring nodes during a system-wide initialization. The specific reason for each output format is as follows:

Format 1:Fields 9 and 10 of the MDCT record identified in the output message contains no identity to its associated UCB record.

Format 2:A UCB record containing the entry RPC in the device\_type field has been assigned a member number other than 0 in the unit\_number field. RPC member numbers must be 0.

Format 3:A UCB record containing the entry RUN in the device\_type field has been assigned the member number 0 in the unit\_number field. IUN member numbers must not be 0.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 4:The last two characters entered in the UCB record unit\_name field are not numbers or are out of range, and/or the member number entered in the the unit\_number field is out of range.

Format 5:The entry in the internal\_device field of a RPC UCB record is out of range.

Format 6:The entry in the internal\_device field of a RPC UCB record is a duplicate of the entry in another equipped RPC UCB record. All equipped RPC UCB records must contain different internal\_device values.

Format 7:The last two numbers in the UCB record unit\_name field and the member number in the unit\_number field are identical to those of another equipped ring node UCB record.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                       |
|---|---------------------------------------------------------------------------------------|
| a | Identifies the MDCT record name (e.g., rpcn00m0).                                     |
| b | Identifies the ring node group and member (e.g., RPCN00 0).                           |
| c | A decimal value representing the internal_device field entry found in the UCB record. |
| d | Same as for b.                                                                        |
| e | The converted physical node identifier.                                               |

### 4. ACTION TO BE TAKEN

The detection of any discrepancies will cause the IMS system-wide initialization to abort. The discrepancy in the ECD must be corrected as follows before a successful system-wide initialization can be performed:

Format 1:The name of the associated UCB record should be entered into fields 9 and 10 of the MDCT record via UNIX® RTR Recent Change and Verify (RCV).

Formats 2-4:The UCB record defined by b in the output message should be deleted from the ECD via UNIX® RTR RCV. The discrepancy in the UCB should be determined and a corrected version inserted back into the ECD.

Format 5:The UCB record defined by b in the output message should be updated to the correct device\_id value via UNIX® RTR RCV.

Format 6:Determine whether the UCB record defined by b or d is incorrect and update this record to the correct device\_id value via UNIX® RTR RCV.

Format 7:Determine whether the UCB record defined by b or d is incorrect and delete this UCB record from the ECD via UNIX® RTR RCV. A corrected version of the UCB record should then be inserted back into the ECD.

## 2. REASON FOR OUTPUT

Format 1 - To report that a D-Channel (DCHAN) node has become active.

Format 2 - To report DCHAN defensive check failures. The failure data is delivered from the DCHAN to 3B process Arts for spooler output. The message always prints to the maintenance printer and the CNILOG.

## 3. VARIABLE FIELD DEFINITIONS

- a DCHAN group number.
- b DCHAN member number.
- c DCHAN error code:
- 0x1000 — Send event failed
  - 0x1001 — Call to \_im\_s\_tmr() failed
  - 0x1002 — Call to \_im\_k\_tmr() failed
  - 0x1003 — Source match or Returned message
  - 0x1004 — Timer was not found
  - 0x1005 — Bad timer requested to set CCV timers
  - 0x1006 — Call to \_ioctl() failed
  - 0x1007 — Call to \_ims\_hdr() failed
  - 0x1008 — Call to \_ims\_write() failed
  - 0x2000 — Data block allocation failed
  - 0x2001 — Data Block link to CRV Table failed
  - 0x2002 — Invalid User CRV

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x2003 — Invalid Network CRV
- 0x2004 — Data block pointer out of range
- 0x2005 — Index to data blocks out of range
- 0x2006 — Invalid call state
- 0x2007 — Backup buffer pointer out of range
- 0x2008 — Data block allocation failed on backup node
- 0x2009 — Data Block link to CRV Table failed on backup node
- 0x200a — Invalid link number
- 0x3000 — CO-SCCP did not accept TSC request
- 0x3001 — Data request failed to transmit through TSC connection
- 0x3002 — SCCP allocation request failed
- 0x4000 — Invalid Idle Data Block List index
- 0x5001 — Invalid audit number
- 0x5002 — Invalid audit mode
- 0x5003 — Invalid audit message type
- 0x5004 — Process out of Ring Write Buffers

RR: AAAAA BBBB CCC CCDDDD EEEEE FFFFF GGGGG HHHHH  
SS: IIIII JJJJJ KKKKK LLLLL MMMM NNNNN OOOOO PPPPP

## 2. REASON FOR OUTPUT

To specify the error condition detected by the Dual Serial Channel / Computer Interconnect (DCI) driver.

Format 13 report consists of up to three segments of data giving a frequency list of job response times in intervals of one second. Each output segment consists of three lines. The first line gives the time range of the job response times for that segment in fields t through u, the maximum job response time recorded (v), the current segment number (w) and the last segment to be printed (x). The next two lines give the frequency distribution. The beginning of the line (RR or SS) is the time value in seconds corresponding to the first entry in the line. The next eight numbers (AAAAA-HHHHH or IIIII-PPPPP) are the frequency of job responses occurring in consecutive time intervals one second apart.

SEE PROPRIETARY NOTICE ON COVER PAGE

A sample output is shown in Examples 1 and 2. In Example 1, line 1 indicates that DCI 1 had some job responses between 0 and 16 (15+1) seconds, with a maximum reported response time between 21 and 22 seconds and that this is the first of two segments that will be reported. Line 2 shows the job responses received between 0-8 seconds; it indicates that there were 16 job responses received between 0 and 1 second and one response received between 4 and 5 seconds. Line 3 shows the job responses received between 8-16 seconds; it indicates that there was one job response received between 13 and 14 seconds.

In Example 2, line 1 indicates that DCI 1 had some job responses between 16 and 32 (31+1) seconds, with a maximum reported response time between 21 and 22 seconds and that this is the second of two segments that will be reported. Line 2 shows the job responses received between 16-24 seconds; it indicates that there was one job response received between 21 and 22 seconds. Line 3 shows the job responses received between 24-32 seconds; there were no job responses received in this period.

#### Example 1

=====

| REPT | DCI | 1  | JOB | RESP | TIMES | 0-15 | MAX | 21 | SEGMENT | 1 | OF | 2 |
|------|-----|----|-----|------|-------|------|-----|----|---------|---|----|---|

| 8:   |     | 0  | 0   | 0    | 0     | 0    | 1   | 0  | 0       |   |    |   |

#### Example 2

=====

| REPT | DCI | 1 | JOB | RESP | TIMES | 16-31 | MAX | 21 | SEGMENT | 2 | OF | 2 |
|------|-----|---|-----|------|-------|-------|-----|----|---------|---|----|---|
| 16:  |     | 0 | 0   | 0    | 0     | 0     | 1   | 0  | 0       |   |    |   |
| 24:  |     | 0 | 0   | 0    | 0     | 0     | 0   | 0  | 0       |   |    |   |

### 3. VARIABLE FIELD DEFINITIONS

- a An error code or information code number. For the meaning of error or information code, see Output Appendix A APP:DCI-A.
- b Supplemental data for previous REPT:DCIDRV message.
- c Supplemental data for previous REPT:DCIDRV message.
- d DCI unit name
- e DCI unit number
- f One word completion report. It contains information like command completion code, job ID (DMA job number), size of data.
- g Error type:  
BIC REGISTER  
CHAN  
DBS
- h Supplemental data for the previous message.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the error type is CHAN, see DCI Output Appendix C, APP:DCI-C.

If the error type is DBS, see DCI Output Appendix D, APP:DCI-D.

If the error type is BIC REGISTER, see DCI Output Appendix E, APP:DCI-E.

|---|--------------------------------------------------------------------------------------------------------------------------|
| i | Fault code, in hexadecimal notation. See DCI Output Appendix H, APP:DFC-H.                                               |
| j | In case of software faults in the fault code given, it contains the program address where fault occurred.                |
| k | One word completion report. It contains information like command completion code, job ID (DMA job number), size of data. |
| l | BIC status in hexadecimal notation. See Output Appendix E, APP:DCI-E.                                                    |
| m | Mask.                                                                                                                    |
| n | Expected value of BIC status after being masked with mask listed.                                                        |
| o | Autonomous response special completion code. See Output Appendix B, APP:DCI-B.                                           |
| p | Channel number on which error occurred.                                                                                  |
| q | Type of channel code:<br>ERROR<br>INFO                                                                                   |
| r | The unit name of the device which received unknown message.                                                              |
| s | The number of message in hexadecimal notation.                                                                           |
| t | The beginning of the time range indicator.                                                                               |
| u | The end of the time range indicator.                                                                                     |
| v | The maximum job response time to be printed.                                                                             |
| w | The segment number of this report (1, 2 or 3.)                                                                           |
| x | The largest segment number of this report (1, 2, or 3.)                                                                  |
| R | Starting time value.                                                                                                     |
| S | Ending time value+8                                                                                                      |
| A | The number of job timeouts received in the one second time period RR to RR+1 seconds.                                    |
| B | The number of job timeouts received in the one second time period RR+1 to RR+2 seconds.                                  |
| C | The number of job timeouts received in the one second time period RR+2 to RR+3 seconds.                                  |

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                           |
|---|-------------------------------------------------------------------------------------------|
| D | The number of job timeouts received in the one second time period RR+3 to RR+4 seconds.   |
| E | The number of job timeouts received in the one second time period RR+4 to RR+5 seconds.   |
| F | The number of job timeouts received in the one second time period RR+5 to RR+6 seconds.   |
| G | The number of job timeouts received in the one second time period RR+6 to RR+7 seconds.   |
| H | The number of job timeouts received in the one second time period RR+7 to RR+8 seconds.   |
| I | The number of job timeouts received in the one second time period RR+8 to RR+9 seconds.   |
| J | The number of job timeouts received in the one second time period RR+9 to RR+10 seconds.  |
| K | The number of job timeouts received in the one second time period RR+10 to RR+11 seconds. |
| L | The number of job timeouts received in the one second time period RR+11 to RR+12 seconds. |
| M | The number of job timeouts received in the one second time period RR+12 to RR+13 seconds. |
| N | The number of job timeouts received in the one second time period RR+13 to RR+14 seconds. |
| O | The number of job timeouts received in the one second time period RR+14 to RR+15 seconds. |
| P | The number of job timeouts received in the one second time period RR+15 to RR+16 seconds. |

#### 4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

Format 13 is produced when the DCI/VDCI unit e has exceeded the threshold for heartbeat timeouts and will be removed from service, or if the DCI driver receives a signal E\_USR6. When it receives the E\_USR6 signal, it also clears the accumulated job response times after printing the list. The format 13 report provides data about the distribution of DCI/VDCI job response times which is used for determining the network performance and delay characteristics and diagnose network problems. This data can be used to guide the setting of appropriate heartbeat timeout ECD parameters to prevent DCI/VDCI timeouts in consultation with Customer Technical Support.

## 1. FORMAT

REPT DCIDIP ERROR a [b]

## 2. REASON FOR OUTPUT

To report an error condition encountered by the DCIDIP process.

## 3. VARIABLE FIELD DEFINITIONS

- a Process step or reason.
- f00 — sendw( ) failed to send message to Display Administration Process (DAP).
  - f06 — Received invalid message type.
  - f0c — Failed to open the Equipment Configuration Database (ECD).
  - f12 — Failed to attach the ECD.
  - f18 — Failed to get Minor Device Chain Table (MDCT) record for physical Teletypewriter (TTY).
  - f1e — MDCT rid for physical TTY not known.
  - f24 — Failed to get Unit Control Block (UCB) record.
  - f2a — UCB rid for physical TTY not known.
  - f30 — No Record Identification (RID) in message from Dual Serial Channel/Computer Interconnect (DCI) driver.
  - f36 — Failed to get UCB record.
  - f3c — Unit not supported by DCIDIP.
  - f42 — Out of range DCI unit number.
  - f48 — Failed to get Dual Serial Channel/Computer Interconnect Operator Position Terminal (DCIOPT) record.
  - f4e — Invalid UCB RID for DCI.
  - f4f — Failed to get Adjunct UCB record.
  - f54 — Invalid UCB RID for physical TTY.
  - f6a — No data in poke message.
  - f70 — Too many arguments in poke message.
  - f76 — Poke number is not supported.
  - f7c — Option not supported by remove TTY.
  - f82 — Invalid option for restore TTY.
  - f88 — Failed to execute craft shell.
- b System error code number. See System Error Codes Output Appendix, APP:SYSERR.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

This message indicates that the DCIDIP process encountered an error condition either during initialization or when processing a clients request. If the error condition persists, contact the next level of technical assistance.

FROM LNh i in AUget\_msg()
- [13] REPT DCNAP RECEIVED UNKNOWN MSG TYPE  
FROM LNh i in AUret\_msg()

## 2. REASON FOR OUTPUT

Format 1 - Connect to DCNAP port failed.

Format 2 - Enable message failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 - Attach to pas failed.

Format 4 - Received unknown message type from the CRAFT.

Format 5 - Failed to read an IMS channel.

Format 6 - RINGINIT process is not alive.

Format 7 - Failed to open an IMS channel.

Format 8 - Failed to get message buffer.

Format 9 - Failed to build an IMS message header.

Format 10 - Failed to write an IMS message.

Format 11 - Failed to open a file.

Format 12 - Received unknown message type from the D-Channel Node (DCN).

Format 13 - Received unknown message type in returned or source match message.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                              |

ID ..... REPT:DCNAUDSTAT  
WORK CENTER.. MOC  
GENERIC ..... 4AP14 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT DCNAUDSTAT LNb c  
AUDIT AUDIT  
NUMBER INHIBITED  
a d

## 2. REASON FOR OUTPUT

If D-Channel Node (DCN) audit is inhibited in routine and software mode, DCN sends status report every fifteen minutes.

## 3. VARIABLE FIELD DEFINITIONS

- a Audit member. One of the following:
- 1 — Data Blocks audit.
  - 2 — User call reference value (CRV) Table audit.
  - 3 — Network CRV Table audit.
  - 4 — Channel ID Table audit.
  - 5 — Idle Data Blocks List audit.
- b DCN group number.
- c DCN member number.
- d Audit inhibit status for all audits controlled by DCN. One of the following:
- Y — Inhibited
  - N — Not Inhibited

## 4. ACTION TO BE TAKEN

Format 1 indicates if the audit status is inhibited the DCN cannot execute an audit in routine and software mode.

The ALW:DCNAUD input message should be used to allow an inhibited audit unless there is a strong reason not to.

| i  | Bus selector status, in hexadecimal notation. See DFC Output Appendix E, APP:DFC-E.                                                                                                                                           |
| j  | BIC status, in hexadecimal notation. See DFC Output Appendix F, APP:DFC-F.                                                                                                                                                    |
| k  | BIC status, in hexadecimal notation. See DFC Output Appendix F, APP:DFC-F.                                                                                                                                                    |
| l  | Mask.                                                                                                                                                                                                                         |
| m  | Expected value of BIC status after being masked with mask given.                                                                                                                                                              |
| n  | Supplemental data for previous REPT:DKDRV output message.                                                                                                                                                                     |
| o  | Fault code, in hexadecimal notation. See DFC Output Appendix I, APP:DFC-I.                                                                                                                                                    |
| p  | First word of an unidentifiable completion report. This would normally be the command completion word.                                                                                                                        |
| q  | Second word of an unidentifiable completion report. This would normally be the device status word.                                                                                                                            |
| r  | The hexadecimal digit provides the reason for the autonomous response. See Table 3 in DFC Output Appendix B, APP:DFC-B.                                                                                                       |
| s  | The Small Computer System Interface (SCSI) Host Adapter (HA) shadow register status, in hexadecimal notation. See DFC Output Appendix P, APP:DFC-P.                                                                           |
| t  | Information code. See DFC Output Appendix A, APP:DFC-A.                                                                                                                                                                       |
| u  | DMA job ID number.                                                                                                                                                                                                            |
| v  | Job ID in use indicator:<br>Y — Indicates valid job ID.                                                                                                                                                                       |
| w  | Message buffer indicator:<br>N — Indicates a message buffer was not found and PID through SEG_SZ fields are not valid.<br>Y — Indicates a message buffer was found and PID through SEG_SZ fields are from the message buffer. |
| x  | Process ID of the process requesting Input / Output (I/O).                                                                                                                                                                    |

SEE PROPRIETARY NOTICE ON COVER PAGE

|    |                                                                  |
|----|------------------------------------------------------------------|
| y  | Utility ID of the process requesting I/O.                        |
| z  | Page table address of I/O memory segment provided by the client. |
| a1 | Offset into the memory segment.                                  |
| b1 | Number of bytes requested by the client for I/O transfer.        |
| c1 | Page table address of I/O memory segment used by the driver.     |
| d1 | Number of bytes used by the driver for I/O transfer.             |
| e1 | Client's I/O memory segment size.                                |

#### 4. ACTION TO BE TAKEN

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages which provide useful data may be output.

## 1. FORMAT

- [1] REPT DFC a AUTO PUMP NOT STARTED
- [2] REPT DFC a AUTO PUMP STARTED
- [3] REPT DFC a AUTO PUMP IN PROGRESS
- [4] REPT DFC a AUTO PUMP ABORTED
- [5] REPT DFC a AUTO PUMP COMPLETED
- [6] REPT DFC a AUTO PUMP INHIBITED
- [7] REPT DFC a PUMPCODE REMOVED

## 2. REASON FOR OUTPUT

To report the result of Disk Driver (DKDRV) automatically downloading the pumpcode to the Disk File Controller (DFC) or the removal of the pumpcode from the Small Computer System Interface Host Adapter (SCSI HA).

## 3. VARIABLE FIELD DEFINITIONS

a                      Member number of the DFC.

## 4. ACTION TO BE TAKEN

If a termination report specifies that the pump could not be completed, see DKDRV's error messages to determine the reason for the failure. If the problem is caused by the resource limitation, the limitation should be cleared so that the pump can be successfully completed. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

Format 6 indicates that the DKDRV will not try to initiate any more pumpcode downloading on this DFC. The DFC pump must be manually requested.

Format 7 indicates that the pumpcode has been removed from the SCSI HA and the SCSI DFC is running with the operational firmware. This occurs, because the SCSI DFC has operational problem(s) with the running pumpcode. The pumpcode residing on disk should be verified and redownloaded manually.

## 2. REASON FOR OUTPUT

To print the Enhanced Information Report (EIR) provided by the Disk File Controller (DFC).

Format 1 prints when the short form of the EIR is requested.

Format 2 prints when the long form of the EIR is requested.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit number.
- r Number of segments of information report.
- s Sequence number for this report.
- b Data flags. Bit field definitions for `df flags` word are:
- X'8000 — Defect table in memory flag (1-in, 0-out).
  - X'4000 — REX allowed flag (1-ALW, 0-INH).
  - X'2000 — Drive in-service indicator (1-out, 0-in).
  - X'1000 — Optimization bit (1-on).
  - X'0800 — Uncorrectable data error.
  - X'0400 — Defect management update write job.
- c Drive table status word 0. Bit field definitions for `dtstat` word 0 are:
- X'8000 — Disk access required flag.
  - X'4000 — Seek only command flag.
  - X'2000 — Non-disk access command present flag.
  - X'1000 — Defect table setup only - no disk access.
  - X'0800 — Seek required flag.
  - X'0400 — Call to `dtsetp` required.
  - X'0200 — Seek pending flag.
  - X'0100 — Do not enter defect management if set (for DGN).
  - X'0080 — No work.
- d Drive table status word 1. Bit field definitions for `dtstat` word 1 are:
- X'8000 — Go indication flag.
  - X'4000 — Not used.
  - X'2000 — DMA operation completed successfully.
  - X'1000 — DMA operation detected error.
  - X'0800 — Marker read flag.
  - X'0400 — Boot request active flag.
  - X'0200 — Segment break flag.
  - X'0100 — Enable segment breaks.
  - X'0080 — 0-read, boot, verify 1-write, init.
  - X'0040 — Verify command flag.
  - X'0020 — Init command flag.
  - X'0010 — No marker read-wait for index flag.
  - X'0008 — DMA required flag.
  - X'0004 — Address mismatch flag (read only).
  - X'0004 — Write gate off flag (write only).

SEE PROPRIETARY NOTICE ON COVER PAGE

- X'0002 — Skip defect management check.  
X'0001 — First sector flag for read.
- e ID plug number.
- f Command completion code. Different values for autonomous and non-autonomous completion codes.

Values for autonomous completion codes are:

- X'0000 — Instrumentation data.
- X'0100 — Diagnostic failure.
- X'0200 — MHD exerciser failure.
- X'0300 — SYSGEN response.
- X'0400 — Boot complete response.
- X'0500 — DFC idle response.
- X'0600 — Illegal command/parameters.
- X'0700 — High temperature.
- X'0800 — Not used.

Values for non-autonomous completion codes are:

- X'0000 — Successful completion code
- X'0400 — Verify completed - errors detected, however.
- X'8100 — PIC RAM boundary error.
- X'8300 — Seek error on disk.
- X'8500 — No index detected on disk.
- X'8900 — MHD status error.
- X'8B00 — Uncorrectable data error.
- X'8D00 — Disk boundary overflow.
- X'8F00 — Head-sector mismatch error.
- X'9100 — Wrong disk selected.
- X'9300 — No disk selected.
- X'9500 — Head positioning error.
- X'9700 — Head selection error.
- X'9900 — BIC parity error.
- X'9B00 — BIC-PIC soft error.
- X'9D00 — PIC error.
- X'9F00 — DMA setup overwrite.
- X'A100 — Early EOT from DMA.
- X'A300 — No EOT from DMA.
- X'A700 — PSDI FIFO parity error.
- X'A900 — PSDI FIFO underflow error.
- X'AB00 — PSDI FIFO overflow error.
- X'AD00 — PSDI acknowledge failure.
- X'AF00 — Extra data in PSDI FIFO.
- X'B100 — Disk data buffer error.
- X'B300 — Main store address error.
- X'B500 — Disk time out error.
- X'B700 — DMA time out error.
- X'BB00 — Uncorrectable data error in MFGR defect table.
- X'BD00 — Defect table overflow.

SEE PROPRIETARY NOTICE ON COVER PAGE

X'BF00 — Command for defective disk.  
X'C100 — Unable to create our defect table on the disk.  
X'C300 — Manufacturer specified more than the maximum number of defects allowed.  
X'C500 — Uncorrectable data error on area that is guaranteed to be error free.  
X'C700 — Invalid data in defect table.  
X'C900 — Invalid data in RAM.  
X'CB00 — Invalid MFGR defect table.  
X'CD00 — Uncorrectable data error in defect table.  
X'CF00 — Unable to read defect table.  
X'E100 — Bad version information in pump file.  
X'E500 — Pump timeout.  
X'D100 — Unable to read MFGR's defect table.  
X'D300 — Unable to write defect table on the disk.  
X'D500 — ramreg has incorrect value.  
X'D700 — Uncorrectable data error and read TEMP list failed.  
X'D900 — Uncorrectable data error and TEMP list overflow.  
X'DA00 — Uncorrectable data error and the attempt to write the TEMP list failed.

g

Error code status flag:

X'0 — Instrumentation data has not been saved.  
X'4 — Instrumentation data has been saved.  
X'8 — Autonomous response.  
X'C — Autonomous response with instrumentation data saved.

h

Internal DFC error code:

X'001 — REX verify not inserted.  
X'002 — DGN drive number out of range.  
X'003 — Defect table read not inserted.  
X'004 — Read not inserted.  
X'005 — Seek not inserted.  
X'006 — Verify not inserted.  
X'007 — Write not inserted.  
X'008 — DFC online when DGN requested.  
X'009 — MHD online when DGN requested.  
X'00A — Run on board over run.  
X'00B — Invalid DGN command pointer.  
X'00C — Invalid system requested DGN command.  
X'00D — Invalid routine exercise command.  
X'00E — Invalid DGN command type.  
X'00F — No subroutine requested by diagnostic.  
X'010 — Invalid put response table pointer.  
X'011 — putrsp in wrong state.  
X'012 — RAM board failure.  
X'013 — No response from RAM board.  
X'014 — Invalid divide masks detected by axlate.  
X'015 — Invalid current state for putrsp.  
X'016 — Invalid return code from oncyldp.

SEE PROPRIETARY NOTICE ON COVER PAGE

X'017 — Invalid return code from skcylnd.  
X'018 — Invalid return code from skcylnd.  
X'019 — Invalid return code from skcylnd.  
X'01A — Invalid data in DTSTAT0.  
X'01B — Invalid return code from skcylnd.  
X'01C — Invalid input to dtsetp.  
X'01D — schdlr detected invalid DFC state.  
X'01E — Error detected by dtsetp.  
X'01F — Read RAM boundary error.  
X'020 — Write RAM boundary error.  
X'021 — Attempt to cmsmhd when DFC offline.  
X'022 — Attempt to cmsmhd to online-unit not ready.  
X'023 — Select drive in priority SEL/REL failed.  
X'024 — Unit not ready - priority release.  
X'025 — Unclearable fault - priority release.  
X'026 — Defect table not in memory (dfctmg).  
X'027 — Disk maximum address exceeded - axlate.  
X'028 — No end code in RAM defect table (dfctmg).  
X'029 — Bad cylinder translation (dfctmg).  
X'02A — Bad sector for MFGR head (dmngmt).  
X'02B — Bad sector for TEMP head (dmngmt).  
X'02C — Bad head for copy request (dmngmt).  
X'02D — Bad dtstat0 options (dmngmt).  
X'02E — Update defect table write failed (dmngmt).  
X'02F — TEMP defect table write failed (dmngmt).  
X'030 — Not defect management job (dmngmt).  
X'031 — No defects for this drive (cpyupd).  
X'032 — Max head exceeded in MFGR table (cpyupd).  
X'033 — Max cylinder exceeded in MFGR table (cpyupd).  
X'034 — Max sector exceeded in MFGR table (cpyupd).  
X'035 — No end code for MFGR defect table (cpyupd).  
X'036 — Bad defects order in MFGR table (cpyupd).  
X'037 — No end code for TEMP defect table (cpytmp).  
X'039 — Bad TEMP defect table start code (cpytmp).  
X'03B — No end code for COMB defect table (prcdfj).  
X'03C — Defect hash code does not match (prcdfj).  
X'03D — Bad COMB defect table start code (prcdfj).  
X'03E — Read defect table failed (drdchk).  
X'03F — Bad version information in pump data.  
X'050 — Missing routine.  
X'051 — Time-out no sector/index intr in 600us.  
X'052 — On-cylinder could not select disk.  
X'053 — On-cylinder detected seek time-out.  
X'054 — Maximum cylinder number exceeded.  
X'055 — Cylinder mismatch (expected != read).  
X'056 — Head/sector mismatch (expected != read).  
X'057 — Physical address not updated in time.  
X'058 — PSDI FIFO time-out (first address word).  
X'059 — PSDI FIFO time-out (second address word).  
X'05A — PSDI FIFO time-out (reading data).

SEE PROPRIETARY NOTICE ON COVER PAGE

X'05B — PSDI status error during read.  
X'05C — Read gate turn off time out.  
X'05D — Data buffer pointer error (diff > size).  
X'05E — Missed an ECC interrupt.  
X'05F — Uncorrectable data error.  
X'060 — ECC / Address buffer full.  
X'061 — Address update done too late (during write).  
X'062 — Data buffer pointer error (diff > size).  
X'063 — No disk acknowledgment received.  
X'064 — Multiple disk responded (first select).  
X'065 — Wrong or multiple disks responded.  
X'066 — Can't clear drive fault.  
X'067 — Seek error in disk status set.  
X'068 — Seek did not start.  
X'069 — PSDI did not start during a read.  
X'06A — PSDI did not start during a write.  
X'06B — Seek time-out (detected by skcy lnd).  
X'06C — Sector / index interrupt time-out (read).  
X'06D — Sector / index interrupt time-out (write).  
X'06E — Seek error on new cylinder.  
X'06F — Index time out on new cylinder.  
X'070 — PSDI FIFO error during write.  
X'071 — PSDI FIFO unload time before head select.  
X'072 — Job start sector / index interrupt time out.  
X'073 — Time-out waiting for ECC (new cylinder).  
X'074 — Time-out waiting for write to go off.  
X'075 — Uncorrectable data error during verify.  
X'076 — Address mismatch failure during verify.  
X'077 — Disk access job aborted due to DMA error.  
X'078 — Seek error detected by select routine.  
X'079 — Drive fault during write operation.

i

Status flags. Bit field definitions are:

X'01 — Multiple drives responded.  
X'02 — Wrong drive responded.  
X'04 — No drive responded.  
X'08 — Cannot clear drive fault.  
X'10 — Seek error set when drive was selected.  
X'20 — Cannot make selected drive "ready".  
X'40 — Fatal error during drive select.  
X'80 — Some kind of drive select error occurred.

j

Disk status register. Bit field definitions are:

X'01 — Heads have not been loaded.  
X'02 — On cylinder.  
X'04 — Unit ready.  
X'08 — High temperature warning.  
X'10 — Seek error.  
X'20 — Fault flag.  
X'40 — Sector mark flag.

| r1 | Port number associated with this drive.                                    |
| s1 | Current direction of heads.                                                |
| t1 | Next cylinder for routine exercises.                                       |
| u1 | Next head for routine exercises.                                           |
| v1 | Pointer to initialization pattern.                                         |
| w1 | ECC buffer.<br><b>NOTE:</b> There may be from 1 to 16 fields in segment 9. |
| v1 | Pointers into ECC table.                                                   |
| w1 | Cylinder from disk.                                                        |
| x1 | Track from disk.                                                           |
| y1 | Sector from disk.                                                          |
| z1 | Expected cylinder.                                                         |
| a2 | Expected track.                                                            |
| b2 | Expected sector.                                                           |
| c2 | Block.                                                                     |
| d2 | Word.                                                                      |
| e2 | Correction code.                                                           |

#### 4. ACTION TO BE TAKEN

This report provides supplemental data associated with a response returned to the computer. The messages printed on the Receive-Only Printer (ROP) around the report should be checked to determine the significance of the report.

A two-segment report is generated after a SYSGEN command has been received from the computer and before the response for the SYSGEN command is returned to the computer. All of the data in this particular report should be ignored.

## 2. REASON FOR OUTPUT

To print the Enhanced Information Report (EIR) provided by the Small Computer System Interface (SCSI) Disk File Controller (DFC).

Format 1 prints when the short form of the EIR is requested.

Format 2 prints when the long form of the EIR is requested.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit number.
- b Completion code. See DFC Output Appendix B, APP:DFC-B, Tables 1 and 2.

|   |                                                                                                                                                                                                                                                                                                                    |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c | Number of blocks read/written on short failure of read/write command.                                                                                                                                                                                                                                              |
| d | Bus/Device ID number of the device associated with the activity identified by this response. If the activity references the Host Adapter (HA), this field is not used by the DFC.                                                                                                                                  |
| e | Autonomous completion code. See DFC Output Appendix B, APP:DFC-B, Table 3. Only valid when Job Identification (ID) number is zero.                                                                                                                                                                                 |
| f | Job ID number.                                                                                                                                                                                                                                                                                                     |
| g | Device status word. See DFC Output Appendix C, APP:DFC-C.                                                                                                                                                                                                                                                          |
| h | Operational firmware version. See DFC Output Appendix O, APP:DFC-O.                                                                                                                                                                                                                                                |
| i | Pumpcode version. See DFC Output Appendix O, APP:DFC-O.                                                                                                                                                                                                                                                            |
| j | Enhanced completion code. See DFC Output Appendix B, APP:DFC-B, Table 4.                                                                                                                                                                                                                                           |
| k | Target controller command status byte.<br><br>0x00 — Good.<br>0x02 — Check condition.<br>0x04 — Condition met.<br>0x08 — Busy.<br>0x10 — Intermediate.<br>0x14 — Intermediate - condition met.<br>0x18 — Reservation conflict.<br>0x22 — Command terminated.<br>0x28 — Queue full.<br>0xFF — Status not available. |
| l | Firmware/Driver communications register. See DFC Output Appendix B, APP:DFC-B, Table 5.                                                                                                                                                                                                                            |
| m | HA status register. See DFC Output Appendix N, APP:DFC-N.                                                                                                                                                                                                                                                          |
| n | BIC status register. See DFC Output Appendix F, APP:DFC-F.                                                                                                                                                                                                                                                         |
| o | Previous command received from the 3B. See DFC Output Appendix M, APP:DFC-M. This information may not be useful when pumpcode is running.                                                                                                                                                                          |
| p | Failing command received from the 3B. See DFC Output Appendix M, APP:DFC-M.                                                                                                                                                                                                                                        |
| q | Extended sense data. See DFC Output Appendix J, APP:DFC-J.                                                                                                                                                                                                                                                         |
| r | Number of segments of information report.                                                                                                                                                                                                                                                                          |
| s | Sequence number for this report.                                                                                                                                                                                                                                                                                   |

|    |                                                                                                                                     |
|----|-------------------------------------------------------------------------------------------------------------------------------------|
| m1 | Device busy condition at time of job termination.<br>0 — Device was not in a busy condition.<br>1 — Device was in a busy condition. |
| n1 | Timer ID associated with busy condition.                                                                                            |
| o1 | Host Adapter data buffer address.                                                                                                   |
| p1 | Slow job function pointer.                                                                                                          |
| q1 | Sequential Access Device record information.                                                                                        |
| r1 | Data transfer control information.                                                                                                  |
| s1 | Reserved for future use.                                                                                                            |

**NOTE:** There are normally 1, 6, or 11 segments of data output.

The task entry data does not contain any information that is helpful to a user. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers.

The SCSI commands do not contain any information that is helpful to a user. The information is useful to the developer/maintainer of the firmware/pumpcode. The information may be useful to the Technical Assistance centers. The detailed explanation of this data is in the Lucent Small Computer System Interface (SCSI) definition.

#### 4. ACTION TO BE TAKEN

An information report provides additional information about a condition that could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages that provide useful data may be output.

## 1. FORMAT

REPT DFRMVRST ERROR a b

## 2. REASON FOR OUTPUT

To report an error condition in the DFRMVRST user process.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Function call failure type:
- 1 — Message enable.
  - 2 — Receive wait.
  - 3 — Send to port.
- b                      System error code. See System Error Codes Output Appendix,  
APP:SYSERR.

## 4. ACTION TO BE TAKEN

An operating system function call is failing. Obtain technical assistance to clear the trouble.

ONLINE CU CRITICAL REGISTERS

PSW = q    HSR = r    SSR = t    ER = s

[WARNING: THE OFFLINE CU HAS INITIALIZED ]

## 2. REASON FOR OUTPUT

To report an error encountered by the Control Unit (CU) diagnostic programs. Critical registers are displayed for error codes marked.

If the message WARNING: READ PROBLEMS - SOME REGISTERS MAY BE INCORRECT appears, maintenance channel failures were encountered while reading some of the offline CU registers. Although the registers involved are not indicated, registers containing all zeroes are particularly suspect.

If the message WARNING: THE OFFLINE CU HAS INITIALIZED appears, the ten temporary registers indicated under the variable s field will contain a snapshot taken at the time of the reset (maintenance reset function).

## 3. VARIABLE FIELD DEFINITIONS

- a                      Error code, in hexadecimal notation.
- 41 —    The test count specified at the end of the phase does not agree with number of tests actually executed.
  - 42 —    Offline diagnostic microcode timed out.
  - 43 —    There is an error in a setarg command at the indicated data table location in the phase where the abort occurred.
  - 44 —    Offline main store code execution timed out.
  - 45 —    The verify failed after a pump to the offline microstore by the mcexec data table command.
  - 46 —    The object file specified in an excofl data table command could not be opened for reading or it is not the proper type of file for running offline main store code. Also, file I/O function (lseek) might not have been able to seek to the desired location in the object file.
  - 47 —    Offline main store object file could not be copied from online processor to offline processor.
  - 48 —    Could not set stack register or argument register in offline CU for offline main store execution.
  - 49 —    Cannot setup stack argument count and program counter or address pointer in offline main store.
  - 4A —    The test routine loaded in the offline main store did not execute properly.
  - 4B —    The test routine loaded in the online microstore and/or mainstore did not execute properly.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 4C — The Equipment Configuration Database (ECD) manager could not be opened for a special unit control block request.
- 4D — Illegal helper unit requested.
- 4E — The member version or equipage fields of the ECD for the main store are incorrect.
- 4F — Could not setup UCB for maintenance driver access. Appears only when the host is a UNIX® RTR machine.
- 50 — An invalid parameter was input when running diagnostics using the interactive mode of operation.
- 52 — The special ECDMAN function (ursvucb) could not reserve the specified UCB.
- 53 — Cannot release a previously reserved Unit Control Block (UCB) via the special ECDMAN function urelucb.
- 54 — Cannot find Unit Control Block (UCB) for helper unit.
- 56 — Illegal instruction signal received from operating system.
- 57 — Bus error signal received from operating system.
- 58 — Segment violation signal received from operating system.
- 59 — Error on system call signal received from operating system.
- 5A — The ECD Manager failed to fill in the special device file path name.
- 5B — Could not open the special device file used to talk with the hardware.
- 5C — The ECD manager failed to release a special device file used for communication with the peripheral hardware.
- 61 — The control unit diagnostic controller failed to open Processor Control Process Maintenance Driver (PCPMD).
- 62 — A write to the diagnostic driver ,PCPMD, has failed.
- 63 — This code is an indication to the diagnostic monitor that a phase of the diagnostic completed normally.
- 64 — Could not open data table file or micro code program file.
- 65 — The diagnostic control buffer could not be shared by cudiagc from the diagnostic monitor.
- 66 — The diagnostic control program has encountered an invalid index or argument in a data table.
- 67 — The diagnostic control program was spawned by the diagnostic monitor with the wrong number of arguments.
- 68 — The diagnostic control program could not setup the spooler control string for buffered output to the TTY from which the diagnostic request was input.

|      |                                                                                                                                      |
|------|--------------------------------------------------------------------------------------------------------------------------------------|
| 69 — | The histogram format print file for the main store diagnostic failed to be opened.                                                   |
| 6A — | An illegal option was input while running diagnostics in the interactive mode (that is, EX command).                                 |
| 6B — | Offline register could not be read back to online processor.                                                                         |
| 6C — | Cannot open file for trouble location process.                                                                                       |
| 6D — | The offline Control Unit (CU) has reset via the Maintenance Reset Function (MRF).                                                    |
| 6E — | The datatbl file contains instructions which are not supported on this hardware platform.                                            |
| b    | Index into PCP table.                                                                                                                |
| c    | Error number returned from Processor Control Process Maintenance Driver (PCPMD). See System Error Codes Output Appendix, APP:SYSERR. |
| d    | Left half of instruction to PCPMD, in hexadecimal notation.                                                                          |
| e    | Right half of instruction to PCPMD, in hexadecimal notation.                                                                         |
| f    | Online maintenance channel status, in hexadecimal notation.                                                                          |
| g    | Offline maintenance channel status, in hexadecimal notation.                                                                         |
| h    | Last test executed.                                                                                                                  |
| i    | Data table address.                                                                                                                  |
| j    | Data table statement number.                                                                                                         |
| k    | Task routine index.                                                                                                                  |
| l    | Maintenance channel buffer.                                                                                                          |
| m    | Maintenance channel status.                                                                                                          |
| n    | Bidirectional gating bus.                                                                                                            |
| o    | Microstore data register high half.                                                                                                  |
| p    | Microstore data register low half.                                                                                                   |
| p1   | Microstore address register.                                                                                                         |
| q1   | Microstore address stack entry.                                                                                                      |
| q    | Processor status word.                                                                                                               |
| r    | Hardware status register.                                                                                                            |
| s    | Error register.                                                                                                                      |
| t    | System status register.                                                                                                              |
| u    | Destination bus.                                                                                                                     |
| v    | Source bus.                                                                                                                          |

#### 4. ACTION TO BE TAKEN

An explanation for the appropriate action to be taken are listed according to the error code. Critical registers are displayed for error codes marked with an asterisk (\*).

- 41 — Either an errant transfer was taken during the execution of the phase or the phase data table has been mutilated. Rerun the phase. If the problem remains, the data table file may be corrupted; seek technical assistance.
- \*42 — A specified time limit is set for running microcode to prevent infinite loops. Problems could be due to the microstore not being loaded properly, an offline Maintenance Reset Function (MRF) occurred, or the microcode got stuck in an infinite loop. Usually a retry will correct any microcode timeout problem. If the Central Control (CC) diagnostic was not run before the abort occurred, running it might find the problem.
- \*43 — The number of arguments passed to the offline main store routine does not match the number declared in the setarg command. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
- \*44 — The calling phase sets a specified time limit in which this offline code should execute. Problems can occur if the halt bit was not set when the code finished executing, or if hardware problems prevent running offline code, or a MRF occurred in the offline CU. If the CC and main store diagnostic was not run previous to where the abort occurred, running them might find the problem. If any other offline main store code ran successfully, the offline code file on the disk might be bad. Rerun the phase. If the problem remains, the indicated data table file may be corrupted; seek technical assistance.
- \*45 — After the microcode pump is completed, the code is pumped back to the online for verification. This error means the returned file did not match the file sent. Problem could be in microstore or in the communication between online and offline processors. If the CC diagnostic was not run previous to where the abort occurred, running it might find the problem.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 46 — This can be due to mutilation of the specified object file. Rerun the phase. If the problem remains, the indicated object file may be corrupted; seek technical assistance.
- \*47 — The maintenance driver library function pcpyto is used to do the copy. The online or offline maintenance channel could be faulty. The PCPMD error code, which appears under the heading DRIVER DATA, could help determine the cause of the problem.
- \*48 — Failure to connect to the Equipment Configuration Database (ECD), Unit Control Block (UCB) record ID points to the online Control Unit (CU), or CU was not OUT OF SERVICE. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed.
- \*49 — Some of the things to look for are: The offline CU was not OUT OF SERVICE, the pointer to the UCB is not valid or does not point to a CU UCB in the ECD database, the UCB record ID was pointing to the online processor, or the maintenance channel did not execute the expected number of bytes. Make sure the maintenance request is for the offline CU and that the offline CU is out-of-service. If this is not the problem, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. Also, run CC diagnostic phases 1 through 4 to verify communication between the online and offline maintenance channels.
- \*4A — The PCPMD function pexecothr is used to start execution. The pointer passed to it from cudiagc was not recognized as a valid pointer or did not point to a CU UCB in the ECD. Retry the maintenance request.  
  
If the problem remains, use the RCV command to examine the ECD paying particular attention to the UCB for the unit being diagnosed. The file may be corrupted; seek technical assistance.
- \*4B — The PCPMD function pexeconl is used to start online execution. Retry the maintenance request, and if the problem remains, use the number printed in ERRNO to look up the source of the problem in the System Error Codes Output Appendix, APP:SYSERR.
- 4C — Verify that file /dev/ecd exists.
- 4D — Not used.
- 4E — Use the RCV command to examine the UCD for the mainstore being diagnosed. Verify that there is 1 equipage bit set (starting at bit 0) for each memory array equipped. Also, verify that the low order nibble (4-bits) of the MV field has one of the values:  
1 - TN07; 3 - TN14; 4 - TN28; 5 - TN56; 6 - TN2012 and bit 5 of the MV field should be: 0 - UN39, UN40; 1 - UN59.
- 4F — Function psetup failed to pass a pointer to the top of the UCB to PCPMD. Use RCV to verify ECD is consistent and up to date for the control unit under test.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 50 — The interactive mode is used for main store phase 95. Three types of input errors could cause this problem. (1) The starting address is larger than the ending address. (2) The starting address is larger than the highest possible address. (3) The refresh rate is invalid. The valid refresh rates are from 2 to 16 milliseconds in steps of 2 and 32 to 60 milliseconds in steps of 4. See the EX command in the input message.
- 52 — Check that the `u_admin` field of the UCB is 1 (not reserved). If it is reserved, see the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
- 53 — Display the contents of the UCB for the unit being diagnosed. If the `u_admin` variable is a 0, the UCB is still reserved. See the REPT-MIRA output message (reason 2). If it is not reserved, rerunning the diagnostic should clear the problem.
- 54 — The `getucb` function could not find the UCB for helper unit. Verify that the helper unit was specified correctly in the input command. Use RCV to verify that helper unit UCB exists and is correct. If the problem remains, the data table file may be corrupted; seek technical assistance.
- 56 — Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file `/diag/dgnc/cudiagc` may be corrupted; seek technical assistance.
- 57 — Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file `/diag/dgnc/cudiagc` may be corrupted; seek technical assistance.
- 58 — Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file `/diag/dgnc/cudiagc` may be corrupted; seek technical assistance.
- 59 — Rerun the diagnostic phase which caused this error. If the problem remains, the data table file for the indicated phase or the file `/diag/dgnc/cudiagc` may be corrupted; seek technical assistance.
- 5A — Use the RCV command to verify that the special device file exist in the LOGDEV.
- 5B — The ECD manager must be reinitialized. This ECD function is used only in peripheral (IOP or DFC) units where the unique field in the UCB is ON. Other units may still be diagnosed in the face of this problem.
- 5C — If the special device file was already released, a retry of the request should correct the problem. A second abort means the ECD manager has an internal software problem that can only be corrected by restoring the ECD manager.
- 61 — Verify that file `/dev/cu` exists.
- \*62 — The function `endblk` in `cudiagc` sends a buffer of maintenance channel commands to the offline maintenance channel via the PCPMD function `pexmch`. `pexmch` has failed. The PCPMD error code, that appears under the heading DRIVER DATA, will indicate the cause of the problem. Run CC diagnostic phases 1 through 4 to verify operation of the maintenance channel.
- 63 — This is not an error code and will not cause an abort.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 64 — Verify the existence of the file being opened. If the Statement (S) is zero, a data table file could not be opened. The name of the file (relative to directory /diag/dgnc) is specified in the (P+1)th line in the file /diag/dpt/cu/<file> where P = the phase that aborted, file is selected by the "dgn" line(s) in /diag/util/cu/<unit> and possibly the "mv" field of the UCB, and unit = the name of the unit being diagnosed. If the Index (I) is 17 or 2a, the name of the file is /diag/offcode/mic/<file>.u where file = the file name specified at statement S in the listing of the phase which aborted.
- 65 — The connseg system call has failed. The ERRNO item will indicate the system error reason.
- 66 — Rerun the phase. If the problem remains, the data table file for the indicated phase may be corrupted; seek technical assistance.
- 67 — Rerun the diagnostic.
- 68 — Rerun the diagnostic. If the problem remains, reinitialize the craft interface (key 15 on the Emergency Action Interface (EAI) page at the maintenance terminal).
- 69 — This file should be located in the directory /diag/dgnc under the name dgnff. Verify that this file does exist and has read permission.
- 6A — Verify that the input command syntax is correct. See the EX command in the input message.
- \*6B — This is probably due to a maintenance channel error. Rerun the diagnostic. If the problem remains, run CC diagnostic phases 1 through 4 to test the maintenance channel.
- 6C — The problem could be that there is not enough file space in /tmp. Rerun the diagnostic.
- \*6D — Examine the error register to determine if a hardware error occurred and, if so, its cause. The MSA, MSA1, MSA2 and MSA3 registers form a push-down stack with MSA at the top. The highest register that does not contain 0 or 2b is the microstore address being executed when the MRF occurred. The Program Address (PA) contains the mainstore address being executed when the MRF occurred.
- 6E — Verify that the umodel field in the unit's top-level UCB record is correct. Otherwise, the datatbl file is incorrect or the wrong datatbl file is being invoked. Seek technical assistance to correct these problems.

## 2. REASON FOR OUTPUT

Format 1 is used to report a peripheral driver error encountered by the peripheral diagnostic programs.

Format 2 is used to report a peripheral diagnostic error encountered by the peripheral diagnostic programs.

Format 3 is used to report a LEXEC function failure encountered by the peripheral diagnostic programs.

## 3. VARIABLE FIELD DEFINITIONS

- a Diagnostic reporting the error for the Disk File Controller (DFC), Input/Output Processor (IOP), and Dual Serial Channel/Computer Interconnect (DCI).

SEE PROPRIETARY NOTICE ON COVER PAGE

b

Reason for audit, in hexadecimal notation:

- 41 — Open special device file failed.  
For SMD MHDs with UCB device\_id field = 0 (first MHD on DFC, usually MHD 0 or 1), MHD type read from DFC backplane may not agree with MHD UCB equipage field or may not be read correctly by DFC TN65 or UN64 board.
- 42 — SETIO failed.
- 43 — makeseg failed.
- 44 — sendpw failed.
- 45 — Read PC pump file failed.
- 46 — Driver operation failed.
- 47 — Open PC pump file failed.
- 48 — msgenab failure.
- 49 — msgdisab failure.
- 4A — Open Processor Control Process Maintenance Driver (PCPMD) failed.
- 4B — Write to PCPMD failed.
- 4C — excofl timed out.
- 4D — Open ECD manager failed.
- 4E — Function ugucbn failed.
- 4F — Peripheral Interface Controller (PIC) microstore size not in UCB.
- 50 — Receive wait failed.
- 51 — LEXEC function failed.
- 52 — e\_host of UCB not initialized.
- 53 — lseek function failure.
- 54 — Drive size not 5 or 19 tracks.
- 55 — makeseg failed for disk read / write buffer.
- 56 — Write / read segment too small.
- 57 — Function ugetucb failed.
- 58 — DFC not active.
- 59 — IOP not active.
- 61 — SCSI bus not active.
- 64 — Cannot open data table file or micro program file.
- 65 — Cannot share DCB from DIAMON.
- 66 — Error in the data table.
- 67 — Invalid number of parameters from DIAMON.
- 68 — Open spooler failed.
- 6A — Invalid interactive mode command.
- 6C — Open tlpfile failed.
- 6D — Signal - illegal instruction.
- 6E — Signal - bus error.
- 6F — Signal - segment violation.
- 70 — Signal - software termination.

c

Peripheral driver information/error code, in hexadecimal notation. For DFC and DCI diagnostics, dkdrv interfaces with diagc. For IOP diagnostics, the maintenance handler interfaces with diagc. The DFC information/error codes are in DFC Output Appendix A, APP:DFC-A. The IOP error codes (from the maintenance handler) are in IOP Output

ID ..... REPT:DIAMON-A  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT DIAMON ERROR = a ERRNO = b

## 2. REASON FOR OUTPUT

To report that the Diagnostic Monitor (DIAMON) has aborted one or more diagnostic control processes due to an error condition.

For additional, application-specific information about format or field values, refer to appropriate, application-specific documentation.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code, in hexadecimal notation:
- 41 — A manual request to terminate the maintenance request was entered at the Maintenance Terminal (MCRT).
  - 42 — The diagnostic monitor could not send an event to the diagnostic controller.
  - 43 — Could not find Trouble Locating Procedure (TLP) pathname in the util file.
  - 44 — UNIX® system call (lcall) could not find the Trouble Location Process, or there is no execute permission on the file.
  - 45 — The diagnostic monitor failed to receive a message from the remove process.
  - 46 — The diagnostic monitor could not create a segment of memory to be shared with the diagnostic controller.
  - 47 — The messages queue, maintained by the operating system, was not available for diagnostic usage.
  - 48 — The input message from the Maintenance Input Request Administrator via the operating system to the diagnostic monitor failed.
  - 49 — The diagnostic monitor could not set up the spooler control string for buffered output to the TTY that originated the request.
  - 4A — The diagnostic monitor format file for the maintenance output process has an invalid spooler tag.
  - 4B — An error occurred when trying to open the Equipment Configuration Database (ECD).

SEE PROPRIETARY NOTICE ON COVER PAGE

- 4C — The input request had valid syntax, but one or more fields were found to be incorrect.
- 4D — DIAMON could not find the location of the remove process in the diagnostic utility file.
- 4E — Could not find the location of the restore process in the diagnostic utility file.
- 4F — Failed to spawn the process for removing a unit from service.
- 50 — Failed to spawn the process for restoring a unit to service.
- 51 — An invalid return value was received from the remove process.
- 52 — An invalid return value was received from the restore process.
- 53 — The remove process failed to receive a message.
- 54 — The restore process failed to receive a message.
- 55 — An illegal maintenance input request was received from the maintenance input administrator.
- 56 — The unit requested to be restored is not a restorable unit.
- 57 — The utility file for the remove, restore, diagnose, or trouble location process could not be opened.
- 58 — The unit control block could not be released by the ECD manager.
- 59 — The result of the diagnostic could not be sent from DIAMON to MIRA.
- 5A — The tag in the utility file for the remove, restore, diagnose, or the trouble location process could not be found.
- 62 — Error in the request message. The repeat counter has a value greater than 0 but the RPT option was not specified.
- 63 — A death of child signal was received by the diagnostic monitor, but the diagnostic monitor could not determine which child process was active.
- 64 — A death of child signal was received for the diagc process indicating an exec failure.
- 65 — A death of child signal was received by the diagnostic monitor; however, no child process was being monitored.
- 66 — Incorrect version specification in utility file.
- 67 — Could not remove specified unit or subunit. Error return received from remove process.
- 68 — Could not restore specified unit or subunit.
- 69 — No Trouble Locating Procedure (TLP) process exists for the unit requested.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 6A — No diagnostic exists for the unit requested.
- 6B — The ECD manager failed to write the `u_util` field in the UCB.
- 6C — The ECD manager failed to release a special device file used for communication with the peripheral hardware.
- 6D — Diagnostic monitor could not open the format file for the maintenance output process.
- 6E — Could not open the Diagnostic Phase Table (DPT) file for the requested unit.
- 6F — DIAMON failed to open the ECD manager.
- 70 — The Unit Control Block for the unit under test was not found.
- 71 — Could not get the next unit control block in the diagnostic hierarchy from the ECD manager.
- 72 — The Diagnostic Phase Table (DPT) file could not be read.
- 73 — The diagnostic monitor could not spawn the Diagnostic Control Process (DIAGC) for the unit specified in the input request.
- 74 — An illegal phase number was specified in the diagnostic input request.
- 75 — The UCB for the unit to be diagnosed is already reserved by another maintenance client not under the control of MIRA, or a previous maintenance request failed to release the UCB.
- 76 — Could not open special device file used to talk with hardware.
- 77 — An invalid message was sent from the Maintenance Input Request Administrator or the Diagnostic Controller.
- 78 — The diagnostic monitor was sent an invalid type of request.
- 79 — The diagnostic controller returned an invalid result after a diagnostic phase completed.
- 7A — The diagnostic controller returned an invalid result after a unit diagnostic completed.
- 7B — A request to the ECD manager to update the minor device state has failed.
- 7C — The user has attempted to execute diagnostics on an IOP tape device. This is valid for only DFC tape devices.
- 7D — The user has attempted to diagnose CSU or SAT. These units are part of the CC on this hardware platform.

b

System error code number. See System Error Codes Output Appendix, APP:SYSERR. A system error code of zero means that no system error was reported.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

The error encountered determines the appropriate action to be taken:

- 41 — Rerun the maintenance request.
- 42 — The UNIX® system call sendev believes the diagnostic controller process does not exist. Check that this process exists in the directory /diag/dgnc under the name cudiagc for a control unit diagnostic, dfdiag for a DFC or MHD diagnostic, or iodiag for a DUIC, IOP, MTC, MTTYC, SCSDC, SDLC, or TTYC diagnostic.  
  
Verify line one of the DPT file identifies a valid diagc process. The DPT file is /diag/dpt/<type>/<unit> where unit = the unit type specified in the input request; type = cu if the unit is within a CU, or pu if the unit is within an IOP or DFC. Restore files from the backup file system.
- 43 — A TLP file should be specified in the file /diag/util/ cu/unit\_name for a control unit diagnostic or /diag/util/ pu/unit\_name for a peripheral unit diagnostic. For an example of a util file, refer to error code 5A. Restore file from backup file system.
- 44 — Verify that the file /diag/dgnc/tlp exists and has execute permission. Restore file from backup file system.
- 45 — Errors may occur if the remove process has not enabled message reception, or the requested type or size is invalid. Retry the request.
- 46 — The problem could be insufficient swap space or address space in the user's address space for the segment. Retry the diagnostic until enough user space is free to create a segment.
- 47 — Too many messages are being input at this time for the operating system to handle. Retry the request until the message queue frees up.
- 48 — Retry the request.
- 49 — If the input came from the Maintenance TTY (MCRT), the problem may be correctable by initializing the craft interface (EAI page, key 15).
- 4A — Retry the request. If the problem remains, the file /diag/dgnc/fmat has been mutilated and must be restored from a backup file system.
- 4B — Verify that file /dev/ecd exists.
- 4C — Check the input command for correctness. Perhaps a nonexistent unit type or phase number was specified. Retry the request. Refer to the *Input Message* for a description of the maintenance commands.
- 4D — An RMV file should be specified in the file /diag/util/cu/unit\_name for a control unit diagnostic or /diag/util/pu/unit\_name for a peripheral unit diagnostic. For an example of a util file, refer to error code 5A. Restore file from backup file system.
- 4E — An RST file should be specified in the file /diag/util/cu/unit\_name for a control unit diagnostic or /diag/util/pu/unit\_name for a peripheral unit diagnostic. For an example of a util file, refer to error code 5A. Restore file from backup file system.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 4F — The file was either not found or it did not have execute permission. To verify the remove process for a control unit diagnostic, use the `OP:ST-LISTDIR` command with the filename `/unixutil/cu/curstrmv`. For a peripheral unit diagnostic, the same command with the file name `/diag/dgnc/iormv` or `/diag/dgnc/dfrm` will verify the remove process. If the remove process exists and has execute permission, the system might be out of space. Retry the request until the system process space frees up.
- 50 — The file was either not found, or it did not have execute permission. Refer to error code 4F for the action to be taken since the restore and remove use the same process.
- 51 — Retry the request.
- 52 — Retry the request.
- 53 — The remove process did not enable message reception, the type specified is not valid, or most likely, the remove process has an excessive amount of messages outstanding on its queue. Retry the request.
- 54 — The restore process did not enable message reception, the type specified is not valid, or most likely, the restore process has an excessive amount of messages outstanding on its queue. Retry the request.
- 55 — Check the input command for correctness. Retry the request. Refer to the *Input Message* for a description of the maintenance commands.
- 56 — Check the input command for correctness. Retry the request. If the unit is being falsely taken as unrestorable, use the `RCV` command to update the `u_restorable` field in the Unit Control Block (UCB) for the unit from OFF to ON.
- 57 — Verify the utility file exists with read permission. The file is named `/diag/util/<type>/<unit>` where `unit` = the unit specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore file from backup file system.
- 58 — Either the UCB was not reserved, or an error occurred when trying to release it. Retry the request.
- 59 — Errors can occur if MIRA did not enable message reception, an invalid message was sent, or MIRA has an excessive amount of messages outstanding on its queue. Retry the request.
- 5A — Examine the utility file for the unit specified in the input request. It should look like the example of the Central Control utility file:

```
dgn :../dpt/cu/cc
rst :/unixutil/cu/curstrmv
rmv :/unixutil/cu/curstrmv
tlp :tlp
```

The file named `/diag/util/ <type>/<unit>` where `unit` = the unit specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore file from backup file system.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 62 — This is a warning; the phase will run, but not in repeat mode. Identify the process sending the request. Retry the request manually.
- 63 — This error indicates an internal problem in the diagnostic monitor. Retry the request.
- 64 — The `diagc` process could not be executed. Retry the request. If the error continues to occur, restore the `diagc` process from the backup file system. The `diagc` processes are found in the directory `/diag/dgnc`. The names of the `diagc` processes are `cudiagc` (for CU diagnostics) `dfdiag` (for DFC diagnostics) and `iodiag` (for IOP diagnostics). Verify line one of the DPT file identifies a valid `diagc` process. The DPT file is `/diag/dpt/<type>/<unit>` where `unit` = the unit type specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore files from the backup file system.
- 65 — Retry the request.
- 66 — Examine the multiple version lines of the appropriate utility file for incorrect version number representations like octal 8 (08). Also, verify that each tag has a multiple version line that has a value that is less than or equal to the MV in the UCB for that subunit. Multiple version utility file lines look like: `tlp :0x0:tlp`
- 67 — Verify correctness of input unit specification. For example: CU 0, CC 0 is not valid. Further information can be obtained from remove process output messages.
- 68 — Verify correctness of input unit specification. For example: CU 0, CC 0 is not valid. Further information can be obtained from restore process output messages.
- 69 — Do not use the TLP option for this unit.
- 6A — Do not use the DGN or EX commands with this unit.
- 6B — Use the RCV command to verify that the `u_util` field in the UCB for the unit specified in the input request is of the form `cu/<unit>` or `pu/<unit>`.
- 6C — If the special device file was already released, a retry of the request should correct the problem. A second abort means the ECD manager has an internal software problem that can only be corrected by restoring the ECD manager.
- 6D — Verify the file `/diag/dgnc/fmat` exists with read permission.
- 6E — Verify the DPT file exists with read permission. The file is named `/diag/dpt/<type>/<unit>` where `unit` = the unit specified in the input request; `type` = `cu` if the unit is within a CU, or `pu` if the unit is within an IOP or DFC. Restore file from backup file system.
- 6F — Verify that file `/dev/ecd` exists.
- 70 — An invalid equipment ID was entered in the input request, or a ECD problem exists. Check the input command for correctness. Retry the request. Refer to the input messages for a description of the maintenance commands. Verify the database correctness using the recent change and verify command `RCV:MENU;BROWSE`.
- 71 — Verify the database correctness using the recent change and verify command `RCV:MENU;BROWSE`.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 72 — Verify the DPT file exists with read permission. The file is named /diag/dpt/<type>/<unit> where unit = the unit specified in the input request; type = cu if the unit is within a CU, or pu if the unit is within an IOP or DFC.
- 73 — Verify the DIAGC file exists with the execute permission. The file is named /diag/dgnc/<name> where name = cudiagc if the unit is within a CU, iodiag if the unit is within an IOP, or dfdiag if the unit is within a DFC. Restore file from backup file system. The system may be at its process limit. Retry the request when the system process space frees up.
- 74 — Check the input request for correctness. Retry the request. Refer to the input messages for a description of the maintenance commands. Verify the DPT file has active phases. The DPT file is /diag/dpt/<type>/<unit> where unit = the unit type specified in the input request; type = cu if the unit is within a CU, or pu if the unit is within an IOP or DFC. Restore file from the backup file system.
- 75 — Refer to the REPT:MIRA output message.
- 76 — The ECD manager must be reinitialized. This ECD function is used only in peripheral ,IOP or DFC, units where the unique field in the UCB is ON. Other units may still be diagnosed in the face of this problem.
- 77 — Retry the request.
- 78 — Retry the request.
- 79 — Retry the request.
- 7A — Retry the request.
- 7B — Seek technical assistance.
- 7C — The unit name or number is incorrect. If the tape device is an IOP sub-device the MTC should be diagnosed. If the tape device is a DFC sub-device the unit number is incorrect. Correct the input command and retry the request.
- 7D — Use the DGN:CU input message to diagnose the CC.

## 1. FORMAT

REPT DIAMON ERROR = a ERRNO = b

## 2. REASON FOR OUTPUT

Reports that the diagnostic monitor (DIAMON) has aborted one or more diagnostic control processes due to an error condition.

**NOTE:** It is important to note that this output document message merely supplements the corresponding UNIX® RTR output document message. This document message expands on the definitions of some values of the a field when a ring node is the target of the diagnostic request that resulted in this output message.

## 3. VARIABLE FIELD DEFINITIONS

- a (41 - 7A) - Error code, in hexadecimal notation.
- b System error code number. See System Error Code Numbers in output appendix APP:SYSERR.

## 4. ACTION TO BE TAKEN

An explanation of the error encountered and the appropriate action to be taken is shown in the following table ONLY FOR THOSE ERROR CODES that require a definition that expands on the definition found in the corresponding UNIX® RTR output document when a ring node is the target of the diagnostic request that resulted in this output message. These definitions SUPPLEMENT the UNIX® RTR output document definitions. For other error codes, the UNIX® RTR output document contains the full definition.

TABLE 1

| a  | Explanation                                                                               | Action to be taken                                                                                                                                                                                                                                                                                                                                                                      |
|----|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 42 | The diagnostic monitor could not send an event to the controller.                         | Check that the diagnostic controller exists in the directory /cmp/ims/diag/dgnc under the name imsdia.                                                                                                                                                                                                                                                                                  |
| 4D | DIAMON could not find the location of the remove process in the diagnostic utility file.  | An RMV file should be specified in the /diag/util/pu/iun file for an LN diagnostic, or in the /diag/util/pu/rpc file for an RPC diagnostic. For an example of a util file, refer to error code 5A.                                                                                                                                                                                      |
| 4E | DIAMON could not find the location of the restore process in the diagnostic utility file. | An RST file should be specified in the /diag/util/pu/iun file for an LN diagnostic, or in the /diag/util/pu/rpc file for an RPC diagnostic. For an example of a util file, refer to error code 5A.                                                                                                                                                                                      |
| 4F | Failed to spawn the process for removing a node from service.                             | The file was either not found or it had no execute permission on it. To verify the remove process for a ring node, use the OP:ST,LSTDIR command (of the OP:ST,LSTDIR input message) with the filename /cmp/ims/diag/dgnc/imsrmvrst. If the remove process exists and has write permission, the system might be out of space. Retry the request until the system process space frees up. |
| 50 | Failed to spawn the process for restoring a node to service.                              | The file was either not found or it did not have execute permission. Refer to error code 4F for the action to be taken, since restore and remove use the same process.                                                                                                                                                                                                                  |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (cont'd)

| a  | Explanation                                                                                                        | Action to be taken                                                                                                                                                                                                                                                                                                                                                                                  |
|----|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 53 | The remove process failed to receive a message.                                                                    | The remove process did not enable message reception, the type specified is not valid, or most likely, the remove process has excessive amount of messages outstanding on its queue. Retry the request.                                                                                                                                                                                              |
| 57 | The utility file for the type of node specified in the input request could not be opened.                          | Verify the utility file exists with read permission. The file is named /diag/util/put/iun for an LN node, and is named /diag/util/put/rpc for an RPC node.                                                                                                                                                                                                                                          |
| 5A | The tag in the utility file for the remove, restore, diagnose, or the trouble location process could not be found. | Examine the file named /diag/util/put/iun if the input request specified an LN node, or the file named /diag/util/put/rpc if the input request specified an RPC node. It should look like the following example of the RPC utility file.<br><br>dgn :.../cmp/ims<br>/diag/dpt/rpc<br><br>rmv :.../cmp/ims<br>/diag/dgnc/imsrmvrst<br><br>rst :.../cmp/ims<br>/diag/dgnc/imsrmvrst<br><br>tlp :notlp |
| 64 | Diagc was running when Diamon received a death of child signal.                                                    | Verify that the imsdv.p process is active (See the OP:RING input command), then retry the diagnostic.                                                                                                                                                                                                                                                                                               |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (cont'd)

| a  | Explanation                                                                                               | Action to be taken                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----|-----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6E | Could not open the data phase table (DPT) file for the type of node specified in the input request.       | Verify the DPT exists with read permission. The file is in the /cmp/ims/diag/dpt directory and is named rpc for an RPC node, iun for an application link node, and ims for an IMS only link node.                                                                                                                                                                                                                                          |
| 72 | The diagnostic phase table (DPT) file could not be read.                                                  | See error code 6E for the action to be taken.                                                                                                                                                                                                                                                                                                                                                                                              |
| 73 | The diagnostic monitor could not spawn the diagnostic control process (DIAGC) for a ring node diagnostic. | Verify that the DIAGC file exists with execute permission. The file is named /cmp/ims/diag/dgnc/imsdiag.                                                                                                                                                                                                                                                                                                                                   |
| 76 | Could not open special device file. This is used to limit the concurrency of imsdia processes to one.     | This will occur if multiple ring node diagnostics (DGN or conditional RST) are in the active MIRA queue. These multiple requests can involve multiple RPC nodes, or concurrent requests on an RPC node and an LN node. Retry the request when no other ring node diagnostics are in progress. See the OP:DMQ and STOP:DMQ input commands. If this does not clear the problem, see the corresponding UNIX® RTR document message error code. |

## 1. FORMAT

- [1] REPT DIOP DIOPNKILL UNSWAP FAILURE a
- [2] REPT DIOP DIOPNKILL SWAP FAILURE a
- [3] REPT DIOP SIMPLEX UNSWAP FAILURE a  
REPT DIOP SIMPLEX PROCESSING FAILURE
- [4] REPT DIOP SIMPLEX PROCESSING COMPLETED
- [5] REPT DIOP DUPLEX SWAP FAILURE a
- [6] REPT DIOP DUPLEX PROCESSING COMPLETED
- [7] REPT DIOP ALL NONESSENTIAL IMS PROCESSES TERMINATED

## 2. REASON FOR OUTPUT

Format 1 reports that a process has requested that it be made Disk Independent Operation (DIOP) essential while the computer disks are simplex, but the kernel cannot swap it in or make it nonswappable.

Format 2 reports that a process has requested that it be made disk independent operation nonessential, but the kernel cannot make it swappable.

Format 3 reports a swappable disk independent operation essential process cannot be made nonswappable in the computer disk simplex mode.

Format 4 reports the successful execution of the disk simplex operation. All swappable disk simplex essential processes have been swapped in and made nonswappable.

Format 5 reports that while attempting to re-enter computer disk duplex operation, a process that was made nonswappable because it was disk independent operation essential cannot be made swappable.

Format 6 reports that computer disk duplex operation has been restored. All processes that were made nonswappable because of Administrative Module (AM) disk simplex operation have been made swappable.

Format 7 reports that the switch has been placed in the DIOP mode. All nonessential Interprocess Message Switch (IMS) processes have been terminated. This message is reported every 15 minutes as long as IMS is in the DIOP mode.

SEE PROPRIETARY NOTICE ON COVER PAGE

### **3. VARIABLE FIELD DEFINITIONS**

- a pcode portion of the process's utility Identification (ID).

### **4. ACTION TO BE TAKEN**

For Formats 1, 2, 3, and 5, report the failure message to a technical support person.

For Formats 4 and 6, no action is necessary.

For Format 7, an IMS level 3 or level 4 initialization is required to bring the IMS out of the DIOP mode and restore its full capabilities.

### **5. REFERENCES**

OMDB Key

Formats 1 through 7 have an OMDB key of 334.

## 1. FORMAT

REPT DIOP  
ALL NONESSENTIAL IMS PROCESSES TERMINATED.

## 2. REASON FOR OUTPUT

UNIX® RTR has placed the system in the Disk Independent Operation (DIOP) mode. All nonessential IMS processes have been terminated. This message is reported every 15 minutes, as long as IMS is in the DIOP mode.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

An IMS level 3 or level 4 initialization is required to bring the IMS out of the DIOP mode and restore its full capabilities.

## 1. FORMAT

- [1] REPT DKDIP MESSAGE  
REPT DKDIP ERROR a [b]
- [2] REPT DKDIP MESSAGE  
c

## 2. REASON FOR OUTPUT

Format 1 reports an error condition encountered by the DKDIP process.

Format 2 reports the status of a poke request invoked from the DFSA display page during Disk Independent Operation (DIOP).

## 3. VARIABLE FIELD DEFINITIONS

- a Process step or reason:
- d04 — DKDIP was restarted due to phase 1
  - d18 — received invalid message type - message ignored
  - d22 — failed to get DAP's PID
  - d30 — failed to open the ECD
  - d34 — failed to attach to the ECD
  - d38 — failed to initialize ackdb segment
  - d50 — failed to get UCB record by RID
  - d60 — failed to get UCB record by RID
  - d63 — UCB returned is not a DFC UCB
  - d66 — invalid DFC UCB model field
  - d67 — performance updates stopped because of message overload
  - d68 — sendw() failed to send message to DAP
  - d70 — virtual address translation failure
  - d80 — failed to get UCB record by RID
  - d83 — invalid DFC sub-device type
  - d86 — failed to get UCB record by RID
  - d89 — invalid peripheral device type
- b System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- c Reference to another output message in the output message document.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

Format 1 is printed when the DKDIP process encounters an error condition either during initialization or when processing a client request. If the error condition persists, contact the next level of technical assistance.

For Format 2, appropriate actions can be found under the appropriate output message in the output message document.

#### 5. REFERENCES

##### OMDB Keys

Format 1 has an OMDB key of 259.

Format 2 has OMDB keys of 154, 253, 254, 255, 256, 257, 258, 266,  
267, 268, 574, 575, 576, 609, 653, 654.

ID ..... REPT:DKDRV  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT DKDRV INFO CODE a
- [2] REPT DKDRV ERROR DATA b
- [3] REPT DKDRV RECEIVED UNKNOWN RCV MESSAGE c d e
- [4] REPT DKDRV WARNING, MHD d PARTITION f IS WRITE RESTRICTED,  
VIOLATING PID g
- [5] REPT DKDRV WARNING, MHD d EXCEEDS LONG TERM FAILURE THRESHOLD

## 2. REASON FOR OUTPUT

Format 1 reports a Disk File Controller (DFC) or Disk Driver (DKDRV) related error condition.

Format 2 is used to provide additional data for a preceding REPT:DKDRV message. For technical assistance organization use only.

Format 3 reports the DKDRV received notification from Recent Change and Verify (RCV) that the Equipment Configuration Database (ECD) has changed, but the change type is not recognized.

Format 4 reports the Process Identification (PID) of the violating process that tries to access the write-restricted partition.

Format 5 is output when the disk exceeds the failure threshold. Action may be necessary to prevent a system outage.

## 3. VARIABLE FIELD DEFINITIONS

- a DKDRV information code. See DFC Output Appendix A, APP:DFC-A.
- b Supplemental data for previous REPT:DKDRV message.
- c Unit name.
- d Unit number.
- e RCV operation code.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f Partition number.
- g PID of the violating process.

#### 4. ACTION TO BE TAKEN

If Format 1 prints, look up the reason for the information code or data in the DFC Output Appendix A, APP:DFC-A. If hardware is implicated, replace the faulty hardware using standard maintenance procedures. If a software or data malfunction is indicated, then try to correct the problem, if possible.

If Formats 2, 3, or 4 print, save the Receive-Only Printer (ROP) output, then contact your technical assistance organization.

If Format 5 prints, see the *System Maintenance Manual*, handling disk media access errors section.

ID ..... REPT:DLGGETTY  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT DLGGETTY UNABLE TO ACCESS ECD FOR a
- [2] REPT DLGGETTY CANNOT READ GETTY RECORD FOR a
- [3] REPT DLGGETTY UNABLE TO CHANGE DIRECTORY TO b
- [4] REPT DLGGETTY FAILED TO EXECUTE c
- [5] REPT DLGGETTY FAILED TO OPEN d
- [6] REPT DLGGETTY CHANID FOUND IN LOGDEV RECORD a
- [7] REPT DLGGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT

## 2. REASON FOR OUTPUT

To report that the DLGGETTY process has encountered an error while trying to process initialization information for a device. The message will appear on the originating device only.

## 3. VARIABLE FIELD DEFINITIONS

- a Teletypewriter (TTY) device against which the `dlggetty` is executing.
- b The directory which the `dlggetty` could not access.
- c Pathname of the process to be executed.
- d Special device file which could not be opened.

## 4. ACTION TO BE TAKEN

If Format 1 or 2 is printed, verify that the getty record in the Equipment Configuration Database (ECD) for the indicated TTY device is correct.

If Format 3 is printed, verify that the directory indicated in the getty record exists.

If Format 4 is printed, verify that the process which could not be executed exists and is executable.

If Format 5, 6, or 7 is printed, or the errors persist after taking actions indicated, seek technical assistance.

FILE

## **2. REASON FOR OUTPUT**

To report a Dialogue Shell (DLGSHL) related occurrence or error.

Format 1 indicates that the DLGSHL cannot receive messages.

Format 2 indicates that the DLGSHL cannot create or open a segment.

Format 3 indicates that a call to `setio()` failed.

Format 4 indicates that the DLGSHL cannot open the specified device.

Format 5 indicates that the DLGSHL cannot read from the specified device.

Format 6 indicates that the DLGSHL cannot write to the specified device.

Format 7 is printed when the DLGSHL encounters an unknown error, such as an illegal enumeration value.

Format 8 is printed when the synchronous DLGSHL fails to fork the Character Special Device Interface Process (CSDIP).

Format 9 is printed when the synchronous DLGSHL fails to execute the CSDIP.

Format 10 indicates that a call to `gettrap()` failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 11 indicates that a call to `settrap()` failed.

Format 12 indicates that a call to `statio()` failed.

Format 13 indicates that the CSDIP process on the specified device has died.

Format 14 indicates that the DLGSHL cannot access the Equipment Configuration Database (ECD).

Format 15 indicates that the DLGSHL cannot access information relating to terminal and personal authority.

Format 16 indicates that the DLGSHL cannot retrieve information relating to input message authority groups.

Format 17 indicates that communication between the Coordinator Of Spooler Output Processes (CSOP) and the DLGSHL Spooler Output Function (SOF) have been corrupted.

Format 18 is printed when the DLGSHL cannot retrieve the LCHAN environment variable.

Format 19 indicates that the DLGSHL has been terminated.

Format 20 indicates that the DLGSHL has been initiated. A dialogue request character must be typed and, possibly, a password entered before the DLGSHL is ready to accept input messages (see the *System Maintenance Manual*).

Format 21 indicates that a message has requested a change to an environment that does not exist in the `.pname` file (see the *System Maintenance Manual*).

Format 22 indicates that a request to change an execution directory as a result of an environment change has not been honored.

Format 23 indicates that an attempt to change the group Identification (ID) of the DLGSHL failed. This usually occurs as a result of attempts to change the environment.

Format 24 indicates that an attempt to change the user ID of the DLGSHL failed. This usually occurs as a result of attempts to change the environment.

Format 25 indicates that the DLGSHL cannot access the `splrinfo` record in the ECD.

Format 26 indicates that the DLGSHL cannot attach to the *Input Message Catalog*.

Format 27 indicates that the DLGSHL attached to the Maintenance Teletypewriter (MTTY) cannot read the `.pname` file and will, therefore, use a default `.pname` file containing the:  
`0: . . . /cmds1:/cft/shl/cmds.`

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                 |
|---|-------------------------------------------------|
| a | Device name.                                    |
| b | DLGSHL capability mode:<br>FULL<br>LIMP<br>PART |
| c | Input message syntax:<br>MML<br>PDS             |
| d | Label of line.                                  |
| e | Name of the requested directory.                |
| f | Name of the requested group ID.                 |
| g | Name of the requested user ID.                  |

### 4. ACTION TO BE TAKEN

For Format 21, either the message or the .pname file is in error and must be corrected.

ID ..... REPT:DLN-AP  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

```
REPT DLN AP LNa b ERR X'c SEQ d
FILE e LINE f ACTION g h AUX DATA WDS (X')
 iiii iiii iiii iiii
 iiii iiii iiii iiii
```

## 2. REASON FOR OUTPUT

To report DLN AP defensive check failures. The failure data is delivered from the DLN to 3B process DLNCM as input stimulus for DLNCM fault recovery. DLNCM forwards the error message to 3B process ARTS for spooler output. The message always prints to the CNILOG and optionally to the maintenance printer using input message:

SET:DLNAP!

The input message CLR:DLNAP! stops these messages from printing on the maintenance printer (ie., the messages are routed only to the CNILOG).

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

ID ..... REPT:DLN-CNGST  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

This message has two formats.

- [1] REPT DLN CNGST  
DLN a b CNGST SUMMARY  
CNI c d e f  
APP g h i j
- [2] REPT DLN CNGST  
DLN a b CNGST ABATED

## 2. REASON FOR OUTPUT

These messages are used to report that a DLN is or has been in congestion.

Format 1 is printed five minutes after DLN congestion was first detected. The severity and source of the congestion are indicated by the fields in the third and fourth lines of the message. The third line indicates the CNI level of congestion, and the fourth line indicates the application level of congestion. The application congestion level supersedes the CNI congestion level and it determines how much traffic is throttled by the link nodes. The severity of the congestion is determined by the number of seconds in the congestion levels. Congestion level 4 is the most severe level of congestion and level 1 the least severe.

Format 2 is printed five minutes after a Format 1 congestion summary message to indicate that DLN congestion has abated. If DLN congestion has not abated since the last congestion summary report, another congestion summary report will be printed five minutes after the preceding summary report.

## 3. VARIABLE FIELD DEFINITIONS

- a DLN's group number (0-63).
- b DLN's member number (1-15).
- c The number of seconds of CNI level 1 congestion.
- d The number of seconds of CNI level 2 congestion.
- e The number of seconds of CNI level 3 congestion.
- f The number of seconds of CNI level 4 congestion.
- g The number of seconds of application level 1 congestion.
- h The number of seconds of application level 2 congestion.

SEE PROPRIETARY NOTICE ON COVER PAGE

- i                    The number of seconds of application level 3 congestion.
- j                    The number of seconds of application level 4 congestion.

#### **4. ACTION TO BE TAKEN**

This report is purely informational. It indicates that the DLN is at or near processing capacity and attempting to shed load. If this message appears consistently, seek technical assistance.

#### **5. REFERENCES**

None.

| a | Audit name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| b | Audit member number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| c | Value of request acknowledgement error. Possible values:<br><br>2 — request started, printout follows.<br><br>3 — audit system initialization in progress.<br><br>4 — audit system initialization failed.<br><br>5 — access to audit record in the ECD failed.<br><br>6 — requested audit is running.<br><br>7 — another kernel process requested audit is running.<br><br>8 — maximum number of supervisory audits are running.<br><br>9 — requested audit instance is blocked.<br><br>10 — attempt to init or dispatch audit failed.<br><br>11 — an audit with the same name is running.<br><br>12 — audit running in demand mode, cannot block.<br><br>13 — audit running requested, cannot stop and block.<br><br>14 — requested audit or instance is inhibited.<br><br>15 — System Integrity Output Formatter is dead. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- 19 — invalid audit specified.
- 20 — invalid audit instance specified.
- 21 — mode of request not permitted.
- 22 — cannot stop an audit that is not running.
- 23 — cannot stop a non-segmented kernel audit.
- 30 — request resulted in no change.
- d Text explanation of request acknowledgement error. Possible values:
- null string.
  - (ALREADY RUNNING) — audit already running.
  - (OTHER KP AUD RUN) — other kernel audit running.
  - (AUD IS BLKD) — audit blocked.
  - (SAME GRP AUD RUN) — another audit in the same group running.
  - (AUD IS INH) — audit inhibited.
- x DLN group number.
- y DLN member number.

#### 4. ACTION TO BE TAKEN

Seek technical assistance if error occurs.

CALLER: z
- [2] REPT DLNCM PROC (Rsperror): LNx-y DMA RSP UNK  
CALLER: z  
X'b X'c X'd X'e

## 2. REASON FOR OUTPUT

A DMA command was given to a DLN and the DLN responded unexpectedly. This output reports the DLN DMA command response error. The first form is output when the DMA command field job\_stat is equal to 32 (D\_ERROR), variable field a is taken from DMA command field 3 (v\_fld3). The second form is given for all other values of the job\_stat field.

## 3. VARIABLE FIELD DEFINITIONS

- x DLN group number.
- y DLN member number.
- z Address within process DLNCM that received the unknown DMA response.
- a Error code:  
INV\_DATA — The DLN was unhappy with the command data field.  
INV\_JOB — The DLN was unhappy with the command job field.  
INV\_STAT — The DLN was unhappy with the command status field.  
UNKNOWN — The DLN error is unknown to process DLNCM.
- b Data (first word of DLN DMA response buffer).
- c Data (second word of DLN DMA response buffer).
- d Data (third word of DLN DMA response buffer).
- e Data (fourth word of DLN DMA response buffer).

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For every stream fault there is an associated action with the same level and stream error.  
No corrective action is performed if the stream level is 0.

### 1. FORMAT

REPT DLNCM PROC (Stopdln): NO ACTIVE OR STANDBY DLN

### 2. REASON FOR OUTPUT

To report that the DLN side of the stream could not be stopped because there is no active or standby DLN.

### 3. VARIABLE FIELD DEFINITIONS

None.

### 4. ACTION TO BE TAKEN

Restore the DLN(s) unconditionally.

## 1. FORMAT

- [1] REPT DLNCM PROC (Stopstrm): UNKNOWN STREAM DIRECTION a
- [2] REPT DLNCM PROC (Stopstrm): [API | LNb c] DIR a STOP\_SCAN\_NACK
- [3] REPT DLNCM PROC (Stopstrm): [API | LNb c] ERR CODE [d | e ]

## 2. REASON FOR OUTPUT

To report stop stream errors for the Direct Link Node (DLN) or API.

## 3. VARIABLE FIELD DEFINITIONS

- a Stream direction:
  - 1AIN — 1B incoming.
  - 1AOUT — 1B outgoing.
  - BOTH — Both 1B incoming and outgoing unknown integer value.
- b DLN group number.
- c DLN member number.
- d Failure to send STOP SCAN to DLN (see Output Appendix APP:DLNCM-07).
- e Failure to send STOP SCAN to API (see Output Appendix APP:DLNCM-08).

## 4. ACTION TO BE TAKEN

Seek technical assistance if error occurs.

## 5. REFERENCES

## 2. REASON FOR OUTPUT

To report status of retrieving "new" 1B ACI translator office data and correcting the data in all Direct Link Node (DLN)(s). This activity occurs when a 1B system update is in progress. All DLNs are taken offline and get repumped with the 1B ACI translator. This activity must take place to synchronize the location of the active 1B ACI translator with that of what the system is actively running on. If this step fails, calls most likely will be mis-routed by the DLN. If the active and new 1B files are the same, the DLNs will not be pumped.

## 3. VARIABLE FIELD DEFINITIONS

- a DLN group number.
- b DLN member number.
- c CNI state:
  - ??? — Unknown CNI state.
  - ACT — Active.
  - OFL — Offline.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 00S — Out of service.
- STBY — Standby.
- d 1B file name:
- ??? — Unable to determine the 1B file name.
- /dev/1afile0 — 1B file 0.
- /dev/1afile1 — 1B file 1.
- e Error code:
- 0 — No errors encountered.
  - 1 — Pump failed (\_repump).
  - 2 — Pump took too long (\_repump).
  - 3 — Unable to send DLN map (\_repump).
  - 5 — Pump in unknown state (\_repump).
  - 10 — DLN/stream configuration in progress.
  - 20 — Unable to retrieve 1B data, after trying 3 times.
  - 40 — Unable to send DLN map, cannot change.
- f Error code (see Output Appendix APP:DLNCM-18).
- f Code add +10 to the error code then see Output Appendix APP:DLNCM-05.
- g Retry count (range of 1 through 3).

#### 4. ACTION TO BE TAKEN

Seek technical assistance if error occurs. WARNING, if this step fails, calls most likely will be mis-routed by the DLN.

GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT DLNCM PROC (Trafstrt): a [ERR CODE b]

## 2. REASON FOR OUTPUT

To report the stream status after the traffic start sequence has begun.

## 3. VARIABLE FIELD DEFINITIONS

a Explanation of stream status. Possible values:

UNABLE TO START API SIDE OF STREAM  
UNABLE TO START STREAM  
STREAM IS UP (in CNILOG file only)  
API SCANNING STREAM (in CNILOG file only)

b Error code.

For UNABLE TO START API SIDE OF STREAM — (see Output Appendix APP:DLNCM-15).

For UNABLE TO START STREAM — (see Output Appendix APP:DLNCM-13).

## 4. ACTION TO BE TAKEN

If either device is not scanning the stream and the DLN and API are active, start the stream.

- [2] REPT DLNCM PROC (Update): LNa b NOT UPDATED -> BINKMAP CLEAN
- [3] REPT DLNCM PROC (Update): LNa b Update FAILED ERR CODE d
- [4] REPT DLNCM PROC (Update): LNa b Update COMPLETE IN e MSEC

## 2. REASON FOR OUTPUT

To report the status of a Direct Link Node (DLN) update.

## 3. VARIABLE FIELD DEFINITIONS

- a DLN group number.
- b DLN member number.
- c Error message:  
UNABLE TO RETRIEVE DATA FROM 1A DISK FILE
- d Update failure code (see Output Appendix APP:DLNCM-17).
- e Time in milliseconds for DLN update to complete.

## 4. ACTION TO BE TAKEN

Check with the machine administration center to confirm abnormal translation update activity. If DLN update fails, request DLN audit 1 for both the active and standby DLN.

**NOTE:** Only one audit instance can run at a time.

- [2] REPT DLNCM PROC (\_update): LNa b d CMD ERROR e
- [3] REPT DLNCM PROC (\_update): LNa b BAD BINK BLOCK f

## 2. REASON FOR OUTPUT

To report update interface errors between DLNCM and the RTR operating system, a particular DLN, or trap function.

## 3. VARIABLE FIELD DEFINITIONS

- a DLN group number.
- b DLN member number.
- c Disk read error (see Output Appendix APP:DLNCM-06).
- d Type of DLN Pump command:
  - D\_READ D\_STRT — DMA read start.
  - D\_UPDATE D\_STRT — Update start.
  - D\_UPDATE D\_COMP — Update complete.
- e Unable to send DLN command (see Output Appendix APP:DLNCM-07).
- f Bink block number.

## 4. ACTION TO BE TAKEN

Check with the machine administration center to confirm abnormal translation update activity. Seek technical assistance if error occurs.

## 1. FORMAT

- [1] REPT DMQ INHIBIT a ACTIVE  
[, REMAINING TIME b MIN.]
- [2] REPT DMQ ATTEMPT TO DISABLE INHIBIT a FAILED

## 2. REASON FOR OUTPUT

Format 1 reports inhibited maintenance request sources. The source may have been disallowed for an infinite time span, or a finite time span.

Format 2 reports that inhibited maintenance request source listed reached the end of its inhibited time, but the clear of the inhibit failed.

## 3. VARIABLE FIELD DEFINITIONS

- a Source of maintenance requests; for example, Automatic Diagnostic Process (ADP).
- b Time, in minutes, left until requests will be allowed from source listed.

## 4. ACTION TO BE TAKEN

Format 1 requires no action.

For Format 2, use the ALW:DMQ input message to manually allow the inhibited request source a. Seek technical assistance for the cause of the problem.

ID ..... REPT:DUI  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT DUI a {ERROR b [COMPL CODE c] |  
UNIDENTIFIED RESPONSE WD1=d WD2=e}
- [2] REPT DUI a STARTED
- [3] REPT DUI a STOPPED

## 2. REASON FOR OUTPUT

Format 1 reports a Direct User Interface (DUI) subdevice-related software or hardware error.

Format 2 reports that the DUI has changed state from STBY to ACT. A DUI will change to ACT state when the level 2 connection is established, and the data link is in information transfer state.

Format 3 reports that the DUI has changed state from ACT to STBY. A DUI will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies, in hexadecimal notation, the point within the Input/Output Driver (IODRV) where a software or hardware error was detected. See IOP Output Appendix F, APP: IOP-F.
- c Hardware error type. See IOP Output Appendix A, APP: IOP-A.
- d First word of an unidentified completion report.
- e Second word of an unidentified completion report.

## 4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the DUI has changed states. No action is necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

## 1. FORMAT

This message has three formats.

[1] REPT DUMP PBUF (dmptable) COMPLETED  
PBUF INCORE HASHSUM = a

| TYPE | UID | PID | VADDR | PADDR | PHY_DATA | OLD_DATA | NEW_DATA |
|------|-----|-----|-------|-------|----------|----------|----------|
| b    | c   | d   | e     | f     | g        | h        | i        |

[2] REPT DUMP PBUF COMPLETED

[3] REPT DUMP PBUF BUFFER EMPTY

## 2. REASON FOR OUTPUT

Format 1 indicates the data values resulting from successful copy.

Format 2 is command completion message.

Format 3 indicates no entries in overwrite buffer.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                           |
|---|---------------------------------------------------------------------------|
| a | Calculated hashsum over all overwrite entries.                            |
| b | Overwrite type (UID, PID, PMEM, or KERN).                                 |
| c | Utility ID of process overwritten.                                        |
| d | Process ID of process overwritten.                                        |
| e | Virtual address to be overwritten, corresponding to overwrite type.       |
| f | Physical address to be overwritten, corresponding to overwrite type.      |
| g | Physical data value; actual data value at address before overwrite.       |
| h | Old data value; default value is (ffffff) if OLDDATA option was not used. |
| i | New data value.                                                           |

MHD = g STATUS = h [X'i]  
DIFFERS FROM CURRENT DUPLEXED BOOT DISK PAIR  
PLEASE REMOVE THIS SELECTION UNLESS PREPARING TO BOOT

## 2. REASON FOR OUTPUT

Format 1 reports that the sanity timers are inhibited.

Formats 2, 3, and 4 report that root, backup root, or minimum configuration is selected and the system is not currently running in that mode. To avoid inadvertently booting the system in the wrong mode, these selections should only be made just prior to booting the system.

Formats 5 through 8 applies only for the 3B21D machines. The messages are output as a result of either inhibiting Emergency Action Interface (EAI) hardware error reporting via a craft command, or inhibiting EAI hardware error interrupt due to excessive errors.

Format 5 indicates that the error threshold was exceeded on the on-line Central Controller (CC) EAI hardware and an attempt to switch to the other CC failed.

Format 6 indicates that the error threshold was exceeded on the off-line CC EAI hardware. The machine has switched to the currently-active processor due to the error.

Format 7 indicates that EAI error reporting has been inhibited by a software command.

Format 8 indicates that the EAI error reporting has been inhibited by a software command for more than 24 hours. Fault recovery software within the system is automatically enabling this error reporting.

Format 9 reports that an application parameter has been entered, but not followed by a manual initialization. To avoid inadvertently performing a manual initialization with an unknown application parameter set, application parameters should only be input just prior to a manual initialization.

Format 10 reports EAI off-normal selections. One or more fields are displayed whenever an off-normal condition is detected. This message can only be displayed when the hardware platform is configured with the Recovery from the Alternate Boot Disk (ABD) Feature.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 11 reports an inconsistency between the MTTYC 0 and MTTYC 1 hardware or firmware. This message can only be displayed when the hardware platform is configured with the Recovery from the ABD Feature.

Formats 12 and 13 can only be displayed when the hardware platform is configured with the Recovery from Alternate Boot Disk Feature. These output messages report the status of selected MHDs following any change to the EAI page's Boot MHDs selection (Pokes 28 and 29) or following the successful execution of the CFR:DUPLEXDISKS command. These messages are periodically displayed until both selected disks are BOOTABLE and both selected disks are the same as the currently duplexed (mated) pair.

### 3. VARIABLE FIELD DEFINITIONS

|          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| h    | MHD status:<br><br>BOOTABLE — The MHD can be used as a boot disk.<br>NOT BOOTABLE — The MHD is not bootable.<br>RESERVED — The MHD is currently reserved by a system level process. This situation can occur when a maintenance action is in progress, for example, when an MHD is being restored.<br>UNKNOWN — The status of the MHD could not be obtained. Check the Read Only Printer (ROP) for error output messages that may help resolve the reason for this status occurring. |
| i    | Error code when MHD status is NOT BOOTABLE. The error code indicates why the unit was not marked as a valid boot disk. See Bootdiskchk Codes Appendix, APP:BOOTDISKCHK, Result Codes.                                                                                                                                                                                                                                                                                                |

#### 4. ACTION TO BE TAKEN

For Format 1, remove the inhibit sanity timer selection on the EAI page of the maintenance terminal.

For Formats 2, 3, and 4, remove the root, backup root, or minimum configuration selection on the EAI page of the maintenance terminal.

For Format 5, restore the other CU and switch to that CU. Run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output, to the next level of support.

For Format 6, run diagnostics on the faulty CU. If the diagnostic fails, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output, to the next level of support.

For Format 7, re-enable reporting of the EAI hardware errors.

For Format 8, the Type 4 message is for information only, and no action is needed.

For Format 9, clear the application parameter, using poke 43 (Clr Appl Param) or poke 14 (CLR EAI).

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 10, no action is necessary. This is an informational output message that displays one or more off-normal conditions into a single message.

For Format 11, MTTYC 0 and MTTYC 1 should be consistent in terms of the type of hardware circuit packs and the flash memory downloaded on the circuit packs. Determine which circuit pack is causing the inconsistency and either replace it with an MTTYC that supports the Recovery from Alternate Boot Disk (ABD) feature; or, if the circuit pack is the same type, execute diagnostics to download the flash memory. If the ECD contains an invalid equipage value, correct the ECD record.

For Format 12, take action based on the description of the error. If one of the disks is NOT BOOTABLE, it is essential to make that disk BOOTABLE again. If the description of the error is not self-explanatory, seek technical assistance.

For Format 13, re-boot the system so that the selected boot disks become the duplexed (mated) pair, or on the EAI page, enter the appropriate Boot MHD pokes so that the selected values are the same as the duplexed (mated) pair. To determine the duplexed pair, check the RTR 102 page or the MHD status page, then use the 28 or 29 EAI poke to correct the boot disk selection. In this latter case, it is not necessary to re-boot. For example, if MHD 0 and MHD 15 are the currently active disks (the duplexed pair) and the output message is reporting status for MHD 0 and MHD 1, on the EAI page, enter a '28', then '15', then 'y'.

## **5. REFERENCES**

### **OMDB Keys**

Format 1 has an OMDB key of 659.  
Formats 2 through 4 have OMDB keys of 629 and 647.  
Formats 5 through 8 have an OMDB key of 692.  
Format 9 has an OMDB key of 703.  
Format 10 has an OMDB key of 778.  
Format 11 has OMDB keys of 775 and 776.  
Format 12 and 13 have OMDB keys of 771 and 772.

## 1. FORMAT

- [1] REPT ECD BTPARM RECORD MODIFIED  
FIELD=a INCORE=b {[ROOT=c] [ROOTDMLY=d]}  
PLEASE RESTORE THIS FIELD UNLESS PREPARING TO BOOT
- [2] REPT ECD BTPARM RECORD RESTORED WITH VALUES AT LAST BOOT

## 2. REASON FOR OUTPUT

Format 1 reports changes to the `btparm` records in the root ECD and rootdmlly ECD.

Format 2 reports that the `btparm` records in the root ECD and rootdmlly ECD were updated to contain the same values as that which existed at the last boot.

## 3. VARIABLE FIELD DEFINITIONS

- a Field name in the ECD `btparm` record.
- b Value of a at the last boot is the current `incore` value.
- c ROOT ECD value of a. This field is only displayed if it differs from b.
- d ROOTDMLY ECD value of a. This field is only displayed if it differs from b.

## 4. ACTION TO BE TAKEN

With Format 1, take action as indicated in the report. Format 2 does not require any action.

## 5. REFERENCES

OMDB Key

Format 1 has an OMDB key of 717.

Format 2 has an OMDB key of 714.

### 1. FORMAT

REPT EMERGENCY DUMP PARTITION FULL

### 2. REASON FOR OUTPUT

To report that data has been written into the emergency dump partition on disk.

### 3. VARIABLE FIELD DEFINITIONS

See Reason For Output.

### 4. ACTION TO BE TAKEN

Use the OP:EMERSTAT command to learn the status of the data in the emergency dump partition.

Use the COPY:TAPE;EMERDMP command to copy the data to magnetic tape.

Use the CLR:EMERDMP command to zero the indicator flag that triggers this output message.

Send the tape and the status printout to a technical assistance center for analysis.

## 1. FORMAT

- [1] REPT ERRPORT OPEN FAILURE ERRNO a
- [2] REPT ERRPORT READ FAILURE ERRNO a
- [3] REPT ERRPORT b MESSAGES LOST
- [4] REPT ERRPORT PREPHASE MESSAGE

## 2. REASON FOR OUTPUT

Format 1 reports that the computer error logging process (errport) is not able to open its special file /dev/errport.

Format 2 reports that the computer errport has encountered an error in its special file /dev/errport.

Format 3 reports that the computer errport has received output messages after its internal queue was full. These messages have been lost.

Format 4 reports that a message existed in the low core First-In First-Out (FIFO) queue before the computer phased.

## 3. VARIABLE FIELD DEFINITIONS

- a File access error code. See System Error Codes Output Appendix, APP:SYSERR.
- b Number of messages lost.

## 4. ACTION TO BE TAKEN

For Formats 1 and 2, check the status of the file and seek immediate technical assistance. (/dev/errport should be present; it should be a FIFO special file and have read and write permissions.)

For Formats 3 and 4, no action is necessary.

## **2. REASON FOR OUTPUT**

To report error interrupts handled by the Error Interrupt Handler (EIH) that are not associated with the main memory. Among the errors handled are input/output errors, Direct Memory Access (DMA) errors, other Control Unit (CU) hardware errors, and software errors.

Format 1 indicates that the kernel determined that a process attempted an Operating System Trap (OST) with a bad argument.

Format 2 indicates that a faulty unit encountered a fatal error condition. The channel status and channel address are provided in the report.

Format 8 indicates that the maintenance channel is faulty, or a maintenance channel order has been sent to a processor that is not disabled or marked off-line.

Format 9 indicates the off-line CU memory controller has not responded to a memory access.

Format 10 indicates EIH was dispatched to handle an error, but no error bit in the error registers was set.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 11 indicates an error type which EIH does not recognize occurred.

Format 12 indicates that a non-correctable parity error has occurred during a DMA read of a memory location on the currently running CU.

Format 13 is for 3B21D machine only and indicates that a non-correctable parity error has occurred during a DMA read of a memory location on the currently running CU.

Format 14 indicates that an error has occurred because the memory controller of the mate processor had a store error A condition. This error occurs in the off-line CU, but is detected by the on-line CU.

Format 15 is for 3B21D machine only and indicates that an error has occurred because the memory controller of the mate processor had a store error A condition. This error occurs in the off-line CU, but is detected by the on-line CU.

Format 18 is for the 3B21D machine only. This indicates that an error has occurred in the Central Controller (CC) EAI hardware.

### 3. VARIABLE FIELD DEFINITIONS

|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | The sequence number of the report (in hexadecimal).                                                                                                                                                                                                                                                                 |
| b | CU member number.                                                                                                                                                                                                                                                                                                   |
| c | The date in the form mm/dd/yy, month/day/year.                                                                                                                                                                                                                                                                      |
| d | The time in the form hh:mm:ss, hours:minutes:seconds.                                                                                                                                                                                                                                                               |
| e | The program address at the time of error interrupt (in hexadecimal). For software-requested initializations, this is the address of the phase OST and not the address where the problem was detected.                                                                                                               |
| f | The Processor Status Word (PSW) (in hexadecimal). Among the information it contains are the execution level and the processor mode - the kernel mode, kernel process, supervisor process, or user process. See the Register Layouts section of the Error Analysis chapter of the <i>System Maintenance Manual</i> . |
| g | The contents of the primary segment base register (in hexadecimal).                                                                                                                                                                                                                                                 |
| h | The contents of the secondary segment base register (in hexadecimal).                                                                                                                                                                                                                                               |
| i | The contents, in hexadecimal, of the 16 general-purpose registers:<br>R9: — Argument pointer.<br>RA: — Frame pointer.<br>RB: — Stack pointer.                                                                                                                                                                       |
| j | Process utility Identification (ID) (in hexadecimal). See the Error Analysis chapter of the <i>System Maintenance Manual</i> , Process/Problem Table.                                                                                                                                                               |
| k | Process number (in hexadecimal).                                                                                                                                                                                                                                                                                    |

| z  | Internal DMAC register contents (in hexadecimal). This register contains the last main store memory accessed by DMA for either a read or a write.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| a1 | Internal DMAC register contents (in hexadecimal). This data represents the last data word either written or read from main store.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| b1 | Internal DMAC register contents (in hexadecimal). This data represents the value of the DMA incrementor which is a counter used by the DMAC to increment the physical address, map address, and the transfer count during the store operation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| c1 | Internal DMAC register contents (in hexadecimal). This register contains the data being passed between the DMAC and the channels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| d1 | Internal DMAC register contents (in hexadecimal). This register is used as a scratch register by microcode during the virtual to physical translation in a DMA access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| e1 | Internal DMAC register contents (in hexadecimal). This register contains the current channel mask setup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| f1 | Contents of the Channel Data Register (CDR), also known as the Central Control Input / Output (CCIO) bus data register (in hexadecimal).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| g1 | <p>A string defining one of six error types:</p> <p><b>BAD PARITY ON DIO BUS</b>—The DMAC received bad parity from named CHANNEL ADDRESS device on data destined for the main memory during a DMA transfer.</p> <p><b>DIO - ACKNOWLEDGE FAILURE</b>—Either more than one or no channel responded to the DMAC.</p> <p><b>DIO - READY FAILURE</b>—The named channel did not return a READY signal to the DMAC.</p> <p><b>DMA - ADDRESS ERROR</b>—During the virtual to physical address translation, the DMAC found that the requested input/output access was not permitted to physical memory, or, during the data transfer, the data would have been written beyond the end of a segment.</p> <p><b>DMA - ASW FAILURE</b>—The named channel did not return All Seems Well (ASW) to the DMAC.</p> |

SEE PROPRIETARY NOTICE ON COVER PAGE

- DMA - CHANNEL REQUEST ERROR— A device made a request with an invalid DMA RAM entry.
- h1 Status, in hexadecimal, of the channel under the DMAC that encountered the fault. See the Register Layouts section of the Error Analysis chapter of the *System Maintenance Manual*. For Model 1.
- i1 The contents, in hexadecimal, of the faulted channels data register. For Model 2.
- j1 A string defining one of eleven error types:
- BAD ALIGNMENT ON MEMORY REFERENCE— This indicates software fault - the instruction executed with the wrong address (for example, a full-word instruction executed with a half-word address).
- CCIO - COMMAND FAILURE— A second programmed input/output order was sent to the DMAC before the first one was completed.
- ILLEGAL INSTRUCTION— The data in the instruction buffer did not correspond to a valid instruction.
- ILLEGAL OPERAND— One of the operands specified in an instruction is invalid for the opcode.
- ILLEGAL STACK SWITCH— The program attempted to switch to a private stack while it was running on a private stack, or attempted to switch to the kernel stack while it was already running on the kernel stack.
- PARITY DIVERT ERROR— The named unit returned a word with bad parity.
- PRIVILEGED INSTRUCTION VIOLATION— The program tried to execute one of the special instructions without a corresponding privilege bit set in the PSW.
- PROTECTION VIOLATION— A program tried to execute from a segment that did not have execute permission, or tried to write into a segment that did not have write permission.
- OUT OF RANGE MEMORY REFERENCE— A program tried to access unequipped memory.
- OUT OF RANGE MEMORY REFERENCE (OTHER STORE)— The off-line main memory considered the address to be out of range while the on-line memory did not. This usually indicates a problem with the off-line memory.
- VIRTUAL ADDRESS OUT OF RANGE— Microcode has determined that a virtual address is not mappable in a process's address space.

|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| z1 | The contents of the UER1 (in hexadecimal). See the Register Layouts section of the Error Analysis chapter of the <i>System Maintenance Manual</i> .                                            |
| a2 | The invalid error number.                                                                                                                                                                      |
| b2 | If bit 27 of the main store controller 0 Trapped Address Register (TAR0) is set, TAR0 contains the address, in hexadecimal, where the fault occurred.                                          |
| c2 | The contents, in hexadecimal, of the main store controller 0 Error Register 1 (ER01). See the Register Layouts section of the Error Analysis chapter of the <i>System Maintenance Manual</i> . |
| d2 | The contents, in hexadecimal, of the main store controller 0 Error Register 2 (ER02). See the Register Layouts section of the Error Analysis chapter of the <i>System Maintenance Manual</i> . |
| e2 | The contents, in hexadecimal, of the main store controller 1 trapped address register (TAR1).                                                                                                  |
| f2 | The contents, in hexadecimal, of the main store controller 1 Error Register 1 (ER11). See the Register Layouts section of the Error Analysis chapter of the <i>System Maintenance Manual</i> . |
| g2 | The contents, in hexadecimal, of the main store controller 1 Error Register 2 (ER12). See the Register Layouts section of the Error Analysis chapter of the <i>System Maintenance Manual</i> . |
| h2 | Error data (in hexadecimal).                                                                                                                                                                   |
| i2 | Physical memory address (in hexadecimal).                                                                                                                                                      |
| j2 | The contents of the MCERT error address register. This is the address where the error occurred.                                                                                                |
| k2 | The contents of the MCERT error register. This register has all the relevant information that caused an error B.                                                                               |
| l2 | The contents of the MCERT status register. This indicates the banks that are present, the size of each bank and the result of the march test.                                                  |
| m2 | The contents of the MCERT command register.                                                                                                                                                    |
| n2 | The contents of the MCERT strobe shape register. This register encodes the timing requirements for various operations in the MCERT circuit.                                                    |
| o2 | The contents of the MCERT main memory register. This register has all the relevant error information.                                                                                          |
| p2 | The contents of the data path MCERT error data register. This register contains the data when the error occurred.                                                                              |
| q2 | The contents of the data path MCERT status register. This register contains information that caused the error A, C, or D.                                                                      |
| r2 | The contents of the MCERT data path command register. This register contains application specific information.                                                                                 |

| s2 | The bank number, in hexadecimal, corresponding to the physical memory address. A value of 0xFF is invalid. This indicates an error in accessing the MCERT (memory controller for the 3B21D machine).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| t2 | <p>A string defining one of four error types:</p> <p><b>MEMORY PARITY FAILURE</b> — Indicates a correctable memory failure occurred in the on-line processor (my store D).</p> <p><b>NONCORRECTABLE PARITY ERROR ON MEMORY REFERENCE</b> — Indicates noncorrectable memory parity failure in the on-line CU.</p> <p><b>OTHER STORE REFRESH PARITY ERROR</b> — Indicates a correctable parity error (other store D) in the mate processor. This type of error can only occur if the mate processor is in the standby state.</p> <p><b>OTHER STORE READ PARITY ERROR</b> — Indicates a noncorrectable memory error (other store C) in the mate processor. This type of error can only occur if the mate processor is in the standby state.</p> |
| u2 | Contents of the EAI error register. This indicates the actual error on the EAI hardware.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

#### 4. ACTION TO BE TAKEN

For Format 1, save the Read Only Printer (ROP) output, note the Utility ID (UID) of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 2, examine the DSCH channel status register layout to determine the error type, and run diagnostics on the unit.

For Formats 3 and 4, for all six error types, run diagnostics on the indicated unit.

For Format 5, for error types **PARITY DIVERT ERROR** and **CCIO - COMMAND FAILURE**, run diagnostics on the indicated unit.

For error types **PROTECTION VIOLATION**, **OUT OF RANGE MEMORY REFERENCE**, **PRIVILEGED INSTRUCTION VIOLATION**, **BAD ALIGNMENT ON MEMORY REFERENCE**, **ILLEGAL OPERAND**, **ILLEGAL INSTRUCTION** and **ILLEGAL STACK SWITCH**, forward the software log entry information from ERLOG to the next level of support.

For error type **OUT OF RANGE MEMORY REFERENCE (OTHER STORE)**, check the fuses in the off-line memory and replace as needed. Run diagnostics on the off-line memory.

For error type **VIRTUAL ADDRESS OUT OF RANGE**, save the information from ERLOG output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 6, run diagnostics on the processor encountering the fault.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 7, save the information from ERLOG output, note the UID of the process that was reported, and inform the next level of support. This is a software problem and requires no diagnostic or board replacements.

For Format 8, if the error occurs more than once in 24 hours, run diagnostics on the off-line processor. If no problem is found, switch processors and run diagnostics on the off-line processor.

For Format 9, check the update cables on both processors and run diagnostics on the off-line processor.

For Format 10, run diagnostics on the CU in which the error occurred and forward the information from ERLOG and ROP output to the next level of support.

For Format 11, if possible, switch processors so that the faulty CU can be diagnosed. Forward the diagnostic results and the information from ERLOG to the next level of support.

For Formats 12 and 13, if the processor switched as a result of the error, run diagnostics on the processor encountering the fault.

For Formats 14 and 15, diagnose the fault unit and forward the diagnostic results and the information from ERLOG to the next level of support.

For Formats 16 and 17, if the error occurred on the off-line CU, check the update cable on both the processors. In all cases, run diagnostics on the faulty processor.

**NOTE:** To run CU diagnostics, the CU that is being diagnosed should be out of service and the other CU active.

Format 18 indicates a fault in the EAI hardware of the CC pack.

Some classes of EAI faults will cause hard failures for which there is no automatic recovery of the EAI. An example of this type of error is a stuck microprocessor address/data bit which will cause indeterminate code execution and block internal recovery. Invalid error register contents reported in the error log (e.g. 00) is an indication that the EAI hardware has detected a fault but is not able to perform fault recovery functions for the EAI. As a result of this hard fault, RTR fault recovery code will not be able to access the EAI hardware, including the EAI error register. The main symptom of this problem is that the EAI hardware routinely report errors even after automatic recovery. When this type of error occurs and if the CUs are in ACT/STBY state, a CU switch will occur and the machine will continue to run on the non-faulty CU (a CU switch will NOT occur if the CUs are in ACT/OOS state). Also, all other system functions should continue as normal.

In any case ensure that the machine is running on the other (non-faulty) CU and run diagnostics on the faulty CU. If the diagnostics fail, replace the CC pack that contains the EAI circuitry and restore the CU. Forward the diagnostic results, the information from the ERLOG and ROP output to the next level of support.

- [6] REPT FAN INHIBIT TIMER HAS EXPIRED c CABINET
- [7] REPT FAN ALARM c CABINET
- [8] REPT FAN ALARM CLEARED c CABINET

## 2. REASON FOR OUTPUT

To report on fan alarm scan points.

Formats 1 and 4 indicate that the fan alarm scan points are no longer inhibited. This is a result of a 30-minute inhibit timer expiring.

Formats 2 and 5 report that the Power Switch Monitor (PSM) failed to remove scan point inhibits.

Formats 3 and 6 report that the inhibit timer has expired and the PSM is taking action to allow the points.

Format 7 reports a scan point transition which indicates a fan alarm in one of the cabinets of the 3B21D computer.

Format 8 reports a scan point transition which indicates the fan alarm in one of the cabinets of the 3B21D computer was cleared.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- |   |                          |
|---|--------------------------|
| a | Unit name.               |
| b | Unit number.             |
| c | Basic or growth cabinet. |

### 4. ACTION TO BE TAKEN

For Formats 1 through 6, if inhibits could not be cleared, information from the REPT:PSM output message will indicate the reason for the failure. Maintenance on the fan units may be required.

For Format 7, determine if the fan units in the indicated cabinet of the 3B21D computer need to be repaired. If all fan units are operational, then fan alarm is the result of the fan circuitry experiencing excessive heat. This causes the fan to run at high speeds. Seek technical assistance if needed.

For Format 8, no action is needed.

## 2. REASON FOR OUTPUT

Format 1 prints when a node hardware fault indication is dispatched to the fault module and the device has been identified. This message also reports the time stamp, the fault code, as well as the current 3B Interface (3BI) status. This information is for technical study purposes.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 2 reports that the Interprocessor Message Switch (IMS) driver received a fault sent from the config library. The time stamp is also printed.

Format 3 reports that the IMS driver received a fault sent from the config library. At the time of the fault arrival, the node involved was not in the Out Of Service (OOS) status.

Format 4 prints when a hardware fault indication is dispatched to the fault module while it was handling a fault on the same node.

Format 5 reports the return status from the Ring Peripheral Controller (RPC) Direct Memory Access (DMA) restart. In this case a bad RPC DMA sequence number is found when the restart process begins. This information is for technical study purposes.

Format 6 reports the return status from the RPC DMA restart. In this case the RPC has not completed its current DMA job when the restart process begins. This information is for technical study purposes.

Format 7 reports the return status from the RPC DMA restart. In this case the RPC has completed its current DMA job when the restart process begins. This information is for technical study purposes.

Format 8 reports that the IMS driver received a fault indication of type FLT\_Nhhhh. The user need not be concerned with this message; it is for technical study purposes only.

### 3. VARIABLE FIELD DEFINITIONS

|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RPCN | Prints for RPC.                                                                                                                                                                              |
| RPCD | Prints for Direct Link Node (DLN).                                                                                                                                                           |
| a    | Node group number (00-63).                                                                                                                                                                   |
| b    | Node member number. For RPC it is 0 and for a DLN it is not 0.                                                                                                                               |
| c    | Current real time clock stamp (in milliseconds).                                                                                                                                             |
| d    | Fault code in hexadecimal.                                                                                                                                                                   |
| e    | The current 3BI status in hexadecimal.                                                                                                                                                       |
| f    | The return code from the status sensing routing. Use reservation when interpreting the corresponding 3BI status if this code is not X'1 (SUCCESS); 3BI status could be garbage in this case. |
| g    | The number of recursive faults received.                                                                                                                                                     |
| h    | ADRP                                                                                                                                                                                         |
|      | DREP                                                                                                                                                                                         |
|      | PICP                                                                                                                                                                                         |

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

Format 1, if the node is removed, the node should be diagnosed and then restored to service using normal maintenance procedures.

**NOTE:** The Automatic Ring Recovery (ARR) routine, unless inhibited, will attempt (up to 3 times) automatic recovery of Out of Service (OOS) nodes if the node maintenance state is not marked "MANUAL".

The node should self-recover for an occasional transient fault unless the error threshold is exceeded (in this case, the node is removed and the recommended maintenance action should be taken). Each office is encouraged to keep a history of such fault occurrences to help in planning maintenance decisions. When clusters of faults occur and the system is not recovering reasonably, save the Receive Only Printer (ROP) output and seek technical assistance.

Formats 2, 3, these messages accompany message Format 1 when config library faults are involved. No special action is needed.

Format 4, this message accompanies message Format 1 when a fault occurs while the IMS driver is handling a previous fault on the same node. No special action is needed.

Formats 5, 6, 7, these messages accompany message Format 1 when the fault threshold is not exceeded. No special action is needed.

Format 8, this message is for data collection purposes only. No special action is needed.

REPT FIELD MAINT a

## 2. REASON FOR OUTPUT

To report that a poked input message from a field maintenance command page has failed.

## 3. VARIABLE FIELD DEFINITIONS

a Reason for failure:

DISPLAY PAGE FAILED — A request for the display administration process to display the input page failed.

INPUT BUFFER LIMIT EXCEEDED — Fmctrl could not store all of the input message line in the command buffer.

INPUT TEXT EXECUTION FAILED — Failure to communicate with the craft shell when passing the input message for processing.

MESSAGE NOT RECEIVED — An attempt to update the screen via sending a message string to the display administration process has failed.

UNABLE TO SEND MESSAGE TO DAP — An attempt to communicate with the display administration process failed.

UNKNOWN INDICATOR — The input message was not found in the fmctrl command table.

## 4. ACTION TO BE TAKEN

If the error does not involve the display administration process, retry the command. If the error does involve Display Administration Process (DAP), restart DAP. If this does not correct the problem, seek technical assistance.

## 1. FORMAT

REPT FILESYS a OVERFLOW b

## 2. REASON FOR OUTPUT

To report that a UNIX® RTR file system is full or nearly full.

## 3. VARIABLE FIELD DEFINITIONS

- a Severity of overflow condition:
- WARNING — File system is in danger of overflowing, possibly within two hours.
- CRITICAL — File system is completely full.
- b File system name.

## 4. ACTION TO BE TAKEN

Manual action may be required to remove data from the file system named. In order to remove data safely, the user must know which files in the file system are permanent and which are temporary. Refer to the application's specific document for file system maintenance and trouble-clearing procedures.

After the files are removed, the amount of free space in the file system can be displayed by using the UNIX® command `df`, or the `OP:ST-FREEDISK` input command. If the free space is still low, or if the file system overflow condition continues, it is likely that some active processes have opens on files in the file system. The removal of files will not take effect until all opens to the file are closed.

The processes with active opens can be identified by using the UNIX® command `umount`, or the `INH:FILESYS;UMOUNT` input command. The `umount` command will fail to unmount if there are open files in the file system. The processes with active opens may have to be terminated to remove the overflow condition, but discretion is advised. In case of uncertainty, the next level of support personnel should be consulted.

In particular, when an overflow condition is reported for `/dev/tmp`, it is recommended that a corrective measure be taken to clear the overflow condition. A shortage in `/dev/tmp` free space may result in loss or mutilation of ROP messages, or other unforeseen malfunctions in the system.

## 1. FORMAT

REPT FMGR a TABLE b FAIL  
ERROR = c DATA X'd

## 2. REASON FOR OUTPUT

To report an alteration or a failed attempt to alter the size of File Manager (FMGR) tables.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Name of FMGR table:
- CAPABILITY — Capability table.
- FILE            — File table.
- INODE         — Inode table.
- b                      Action taken on FMGR table:
- GROWTH     — Increase in size.
- DEGROWTH — Decrease in size.
- c                      Reason FMGR was unable to grow:
- 1 —     System is currently in Disk Independent Operation (DIOP).
- 2 —     Insufficient time since last unsuccessful growth attempt.
- 3 —     Resource is already at its maximum size.
- 4 —     Cannot allocate a message buffer for message to the memory manager.
- 5 —     Cannot allocate additional memory.
- 6 —     Cannot send the message to the memory manager.
- 7 —     Another task is growing the resource.
- d                      If non-zero, status indicates why memory manager cannot allocate additional memory.

## 4. ACTION TO BE TAKEN

If GROWTH failure, reduce system load. If DEGROWTH failure, FMGR will deallocate as needed at a later time.

## 1. FORMAT

REPT FMGR DIR SW FAILED:  
INODE a OPEN BY PID b ON c

## 2. REASON FOR OUTPUT

To report that a directory switch request failed because of a busy inode.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                         |
|---|-------------------------------------------------------------------------|
| a | The busy inode number.                                                  |
| b | The process Identification (ID) of the process that has the inode open. |
| c | The name of the file system that contains the inode.                    |

## 4. ACTION TO BE TAKEN

Kill the process(es) that has the inode open and try the switch again. Repeat until all processes that have inodes open in the directory structure have been killed. If the switch still does not succeed, report the problem to UNIX® RTR system support.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT FMGR ECD a[-b] PID=c UID=d e

## 2. REASON FOR OUTPUT

To report that the file manager attempted to access an Equipment Configuration Database (ECD) record defining a special device file. In the attempt, something malfunctioned.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Message:
- BAD-DCN — The major device number is invalid for the specified driver type.
- BAD-DRIVER — The driver type is undefined.
- BAD-FIFO — The partition number exceeded the maximum allowed for a fifo device.
- BAD-PERM — One or more of the file permissions exceeded the value of seven.
- RETURN — The lla access function failed, returning number code. This would normally indicate that the special device file is not in the database.
- b                      Number code.
- c                      Process Identification (ID) of the process that sent the message to the File Manager (FMGR).
- d                      Utility ID of the process that sent the message to the FMGR.
- e                      Fully qualified pathname for which the ECD access occurred.

## 4. ACTION TO BE TAKEN

The driver required information normally extracted from the ECD will instead be used as specified in the special device file contained in the file system. If the special device file information (the mdct-rid, partition, and dcN) is inappropriate, then the ECD must be corrected.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT FMGR a IN FILE SYSTEM b

## 2. REASON FOR OUTPUT

To report that space for a file system could not be allocated during `falloc()` or `writetape()` (POSSIBLE CORRUPTION), or that static data in the root file system incore super block was corrupted but has been recovered (SUPER BLOCK RECOVERED).

## 3. VARIABLE FIELD DEFINITIONS

- a Reason for output:
- FMGR INCORE SUPER BLOCK RECOVERED—Static data in root file system incore super block was corrupted but has been recovered.
- POSSIBLE CORRUPTION—Build of a file system's bitmap failed (during `falloc()` or `writetape()`), and file system may be corrupted.
- b The name of the file system.

## 4. ACTION TO BE TAKEN

For FMGR INCORE SUPER BLOCK RECOVERED, file system audit has been requested; examine output when audit completes. If condition persists, report audit results and name of file system to next level of technical support.

For POSSIBLE CORRUPTION, run file system audits.

## 1. FORMAT

REPT FMGR a TABLE b SUCCESS  
NEW RESOURCE SIZE = X'c PAGES  
NUMBER OF FREE ENTRIES = X'd ENTRIES

REPT FMGR a TABLE b FAIL  
ERROR = e DATA1 X'f

## 2. REASON FOR OUTPUT

To report the successful allocation or deallocation of File Manager internal table resources and the new size of the specified resource or the cause of a failed attempt.

## 3. VARIABLE FIELD DEFINITIONS

- a Name of the resource that has increased size. Possible values are:
- CAPABILITY — Capability table.
  - FILE — File table.
  - INODE — Inode table.
- b Action taken on resource. Possible values are:
- GROWTH — Resource has increased in size.
  - DEGROWTH — Resource has decreased in size.
- c Current (after growth/degrowth) size of the resource in pages of memory.
- d Current number of resource entries on the free list.
- e Reason FMGR was unable to grow the resource. Possible values are:
- 1 — System is currently in DIOP.
  - 2 — Insufficient time has passed since the last unsuccessful growth attempt.
  - 3 — Resource is already at its maximum size.
  - 4 — Unable to allocate a message buffer for message to the Memory Manager.
  - 5 — Attempt to allocate additional memory failed.
- f Status returned in acknowledgement from Memory Manager.
- 6 — Unable to send the message to the memory manager.
  - 7 — Another task is growing the resource.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

There is no action to be taken for the first message. It is intended for informational purposes only.

In case of resource growth failure, attempt to reduce system load.

In case of resource deallocation failure, no action is necessary. The File Manager will attempt to deallocate the resource, as needed, at a later time.

## 1. FORMAT

REPT FMGR: a TABLE OVERLOAD b, COUNT = c

## 2. REASON FOR OUTPUT

To report that one of the file manager tables is approaching an overload condition or to report that the overload condition has been cleared.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Name of file manager internal table:
- CAP    — Capability table.
- FILE   — File table.
- INODE — Inode table.
- b                      Indicates severity of overload:
- CLEARED — A number of table entries have been freed since last warning/critical report.
- CRITICAL — Very close to complete exhaustion.
- WARNING — Most table entries have been allocated, still a few free entries.
- c                      Number of table entries in use.

## 4. ACTION TO BE TAKEN

No action is necessary. AUD:FMGR;2, AUD:FMGR;4, or AUD:FMGR;5 could be taken to ensure correctness of the use count of the inode, file, or capability table.

## 1. FORMAT

REPT FMGR PROCESS KILLED BY UNCONDITIONAL MOUNT  
PID=a, UID=b, MOUNT POINT=c

## 2. REASON FOR OUTPUT

To report that the FMGR has terminated a process due to an unconditional mount request.

If the FMGR is requested to mount a file system unconditionally, all non-kernel processes that have the mount point open (for example, a process with the mount point at its current working directory) will be terminated.

## 3. VARIABLE FIELD DEFINITIONS

- a Process Identification (ID) of the terminated process.
- b Utility ID of the terminated process.
- c Mount point of the unconditional mount request.

## 4. ACTION TO BE TAKEN

Important system processes should restart automatically, so no direct action is required of the craft. Save the Receive-Only Printer (ROP) output and seek technical assistance to determine why it was necessary to terminate the indicated process.

## 2. REASON FOR OUTPUT

To report on Generic Access Package (GRASP) conditions of a general or emergency nature.

## 3. VARIABLE FIELD DEFINITIONS

- a Condition reported:
- DATA BUF — GRASP dump data is affected.
  - DYNAMIC — The status of the dynamic timer is changing.
  - FLDOP — There are other field operation processes with which GRASP cannot coexist. GRASP cannot proceed.
  - MESSAGE BUF — GRASP completion messages are affected.
  - STATIC — The static memory area internal to GRASP is affected.
  - UC — The utility circuit is affected.

SEE PROPRIETARY NOTICE ON COVER PAGE

- b                      Status:
- ABORT — GRASP is being terminated. Stop issuing additional commands immediately. Expect no additional message.
- FULL — The trace was stopped as requested in the INIT:UMEM input message. Trace memory is full.
- LOST — If condition reported is DYNAMIC, then the timer override has been lost and the default will take effect with the next debugging session.  
                            If condition reported is STATIC, then the static memory area used by GRASP is full, or an internal error occurred in trying to allocate memory from this area.
- OVFL — More data is being produced than can be printed. The oldest data is overwritten with the newest data.
- RESET — The default value of the timer is in effect.
- UNAV — The facility in a is not available.
- c                      CONDITION RUNNING WAS RUNNING NOW STOPPED. The trace was stopped.
- d                      CONDITION TRIGGERED. An external event trigger occurred.
- e                      Numeric identifier (one or more decimal digits) for the breakpoint affected.
- f                      Generic Access Package (GRASP) execution sequence number.
- g                      Utility ID (UID) of the target process as specified in Practice 254-341-115.
- h                      Process ID (PID) of the target process.
- i                      Firing number (one or more decimal digits) of breakpoint.
- j                      RANGE ERROR (DTIME)  
                            RANGE ERROR (UNTIL)

ID ..... REPT:HSD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT HSD a {ERROR b [c] [COMPL CODE d]|  
UNIDENTIFIED RESPONSE WD1=e WD2=f}
- [2] REPT HSD a WARNING LAST LINK IN DUPLEX LINK  
GROUP BEING REMOVED
- [3] REPT HSD a STARTED
- [4] REPT HSD a STOPPED

## 2. REASON FOR OUTPUT

Format 1 reports a High-Speed Synchronous Datalink (HSD) link related software or hardware error.

Format 2 reports the last available link in a duplex link group is being removed from service.

Format 3 reports that the HSD has changed state from STBY to ACT. An HSD will change to ACT state when the level 2 connection is established, and the data link is in information transfer state.

Format 4 reports that the HSD has changed state from ACT to STBY. An HSD will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies, in hexadecimal notation, the point within the Input/Output Processor (IOP) Driver (IODRV) where a software or hardware error was detected. See IOP Output Appendix F, APP:IOP-F.
- c Character string giving more information about the error identified. Refer to IOP Output Appendix F, APP:IOP-F for additional explanation.
- d Hardware error type, in hexadecimal notation. See IOP Output Appendix A, APP:IOP-A.
- e First word of an unidentified completion report.
- f Second word of an unidentified completion report.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

For Format 2, removal of the last available link in a duplex link group indicates that no data transmission can take place over the link facility. One of the links in the group should be repaired and then restored to service.

Formats 3 and 4 are informational messages and indicate that the HSD has changed states. No action is necessary.

#### 5. REFERENCES

##### OMDB Key(s)

UNIDENTIFIED RESPONSE WD1=d WD2=e}
- [2] REPT HSDC a CODE VERSION X'f
- [3] REPT HSDC a FLASH RAM VERSION X'g

## 2. REASON FOR OUTPUT

Format 1 reports a High Speed Synchronous Data Link Controller (HSDC) related software or hardware error.

Format 2 is output during the restoration of the unit.

Format 3 is requested by diagnostics and output prior to the update of flash Random Access Memory (RAM) on the unit.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies the point, in hexadecimal notation, within Input/Output Processor (IOP) Driver (IODRV) where a software or hardware error was detected. See IOP Output Appendix F, APP: IOP-F.
- c Hardware error type, in hexadecimal notation. See IOP Output Appendix A, APP: IOP-A.
- d First word of an unidentifiable completion report.
- e Second word of an unidentifiable completion report.
- f Peripheral controller pump code version number.
- g Peripheral controller flash RAM version number.

## 4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Formats 2 and 3, no action is necessary unless the controller and/or its subdevices are not acting normal, or cannot be restored. Contact the service organization with the code version number and/or flash RAM version number that was used.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT HUSTAT NSC a LOST b c CNTS

## 2. REASON FOR OUTPUT

COAMS hustat collects machine protection and machine service failure counts on a daily basis per NSC frame. This message prints when failure counts are lost due to a partial output message sent by an NSC frame. Even though count(s) were lost, any collected failure counts are forwarded to APS apsmeas, which in turn will forward the failure counts to the 1B.

Failure counts are collected in the following manner:

MPR — alrmi, alrmj, audm, and auda

MSR DSD — icrej, invcmd, invdta, illann, ica, and icabn

MSR T/C — icrej, icnani, ictr, icdsu, icab, icdb, iclev2, icsoft, ica, icabn, ogtr, ogdsu, ogab, ogdb, oglev2, ogsoft, oga, ogvca ogbsy, llp, cctr, ccdsu, ccab, ccdb, cclev2, and ccsoft

If REPT HUSTAT NSC 1 LOST 2 MPR CNTS printed on the Read Only Printer (ROP), it means failure counts alrmi and alrmj were collected and sent to apsmeas, and failure counts audm and auda were lost.

## 3. VARIABLE FIELD DEFINITIONS

a NSC frame number.

b Number of lost counts.

c MPR — Machine performance report.

MSR DSD — Machine service report (for direct services dialing).

MSR T/C — Machine service report (for teleconferencing).

RETRY EQUIP/UNEQUIP REQUEST LATER  
b
- [3] REPT ICDR CONFIG FILE  
NUMBER OF EQUIPPED PARTITIONS c  
TOTAL NUMBER OF ICDR BLOCKS d  
[ e f g ]

## 2. REASON FOR OUTPUT

To provide responses to the OP:ICDR-CONFIG and SET:ICDR-CONFIG input messages.

## 3. VARIABLE FIELD DEFINITIONS

- a Text phrase indicating the outcome of the operation requested by either the OP:ICDR-CONFIG or SET:ICDR-CONFIG input message. (See Action To Be Taken for a list.)
- b Text phrase indicating why the EQUIP or UNEQUIP request must be tried at a later time. (See Action To Be Taken for a list.)
- c Number of equipped international call detail recording (ICDR) partitions.
- d Total number of ICDR blocks that can be stored on disk.
- e ICDR partition number (0-11).
- f ICDR partition file name.
- g Number of ICDR blocks in this partition.

If c = 0, then e, f, and g will not appear in the output message. Variables e, f, and g will only be printed for each ICDR partition that is equipped.

## 4. ACTION TO BE TAKEN

For Format 1, if a =

CONFIG FILE COULD NOT BE OPENED

Refer to ICDR TOPS procedures for resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CONFIG FILE COULD NOT BE READ**  
Refer to ICDR TOPS procedures for resolution.
- COULD NOT ATTACH TO ECD DATABASE**  
Seek technical assistance immediately.
- COULD NOT OBTAIN INFORMATION ABOUT THE PARTITION**  
Seek technical assistance.
- COULD NOT RELEASE ECD DATABASE**  
Seek technical assistance immediately.
- COULD NOT RETRIEVE ECD ORIGIN RECORD**  
Seek technical assistance immediately.
- COULD NOT RETRIEVE ECD ORIGIN RECORD  
AND RELEASE ECD DATABASE**  
Seek technical assistance immediately.
- COULD NOT RETRIEVE MDCT RECORD**  
Seek technical assistance immediately.
- COULD NOT RETRIEVE UCB RECORD**  
Seek technical assistance.
- DEVICE DOES NOT HAVE MAJOR/MINOR NUMBERS**  
Seek technical assistance.
- EQUIP OR UNEQUIP OPTION MISSING FROM INPUT MESSAGE**  
Be sure to include either the EQUIP or UNEQUIP option in the SET:ICDR-CONFIG input message when it is reentered.
- INVALID COMBINATION OF INPUT PARAMETERS**  
Check for one of two errors in the SET:ICDR-CONFIG message. First make sure only one of the following options is used - EQUIP or UNEQUIP, not both. Second, make sure the NOINIT option is not being used with the UNEQUIP option. Try the message again.
- INVALID ERROR CODE RECEIVED**  
Refer to ICDR TOPS procedures for resolution.
- INVALID KEYWORD IN INPUT MESSAGE**  
Check the last SET:ICDR-CONFIG message to determine which keyword is invalid. Be sure to leave out the invalid keyword when the SET:ICDR-CONFIG message is reentered.
- INVALID PARTITION NUMBER IN INPUT MESSAGE**  
The SET:ICDR-CONFIG input message should be reentered using a valid ICDR partition number. Currently, the valid partition numbers are 0 through 11.
- INVALID SPECIAL DEVICE TYPE**  
Seek technical assistance.
- NO INPUT DATA SPECIFIED**  
The SET:ICDR-CONFIG input message should be reentered. Be sure to include the fields needed after the second colon.

SEE PROPRIETARY NOTICE ON COVER PAGE

NO UCB FOR THE DEVICE

Seek technical assistance.

PARTITION x WAS SUCCESSFULLY UNEQUIPPED

Where x is the partition number (0-11). Indicates that the specified partition was successfully unequipped. No action is necessary.

PARTITION NOT EQUIPPED FOR THIS STREAM

The ICDR partition specified in the SET:ICDR-CONFIG message is not equipped for the requested stream. Enter the OP:ICDR-CONFIG input message to determine the state of the configuration file(s) and proceed accordingly.

PARTITION NUMBER MISSING FROM INPUT MESSAGE

Reenter the SET:ICDR-CONFIG input message and be sure to specify the PART keyword and a valid ICDR partition number (0-11).

REQUESTED PARTITION IS ALREADY EQUIPPED

The SET:ICDR-CONFIG input message attempted to equip an already equipped partition. Use the OP:ICDR-CONFIG input message to determine the state of the configuration file(s) and proceed accordingly.

TEMPORARY FILE COULD NOT BE CREATED

A file could not be created to print the appropriate output message. Enter the OP:ICDR-CONFIG input message to determine the state of the configuration file(s) and proceed accordingly.

UNEQUIP REQUEST STOPPED

THERE IS PRIMARY DATA ON THIS PARTITION

The UNEQUIP operation was stopped because there is primary data on the partition. Once all the primary data has been removed, the partition can be unequipped.

WARNING - ICDR PARTITION COULD NOT BE OPENED

UNEQUIP OPERATION CONTINUING

In this case, the ICDR partition map could not be opened to determine if there was any primary data on the partition; therefore, the next time this partition is equipped it should be equipped using the NOINIT option so any primary data can be retrieved. **If the NOINIT option is not used, any primary data that was on this partition will be lost.**

WARNING - ICDR PARTITION COULD NOT BE READ

UNEQUIP OPERATION CONTINUING

In this case, the ICDR partition map could not be read to determine if there was any primary data on the partition; therefore, the next time this partition is equipped it should be equipped using the NOINIT option so any primary data can be retrieved. **If the NOINIT option is not used, any primary data that was on this partition will be lost.**

WARNING - REQUEST CONFLICTS WITH

CURRENT ICDR RECORDING INDICATOR

EQUIPPING PROCESS IS IN PROGRESS

LOOK FOR FURTHER OUTPUT

This message indicates that an ICDR partition is being equipped for the ICDR stream even though ICDR is turned off. No action need be taken.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 2, if b =

**CONFIG FILE COULD NOT BE OPENED**

Refer to ICDR TOPS procedures for further resolution.

**CONFIG FILE COULD NOT BE READ**

Refer to ICDR TOPS procedures for further resolution.

**CONFIG FILE COULD NOT BE WRITTEN**

Refer to ICDR TOPS procedures for further resolution.

**COULD NOT ATTACH TO PAS**

Seek technical assistance immediately.

**DISK NOT AVAILABLE FOR NORMAL OPERATIONS**

When the disk that the requested ICDR partition resides on returns to the active or standby state, the ICDR partition can be equipped.

**ICDR CONFIG FILE COULD NOT BE WRITTEN**

Refer to ICDR TOPS procedures for further resolution.

**ICDR CONFIG FILE COULD NOT BE OPENED**

Refer to ICDR TOPS procedures for further resolution.

**ICDR CONFIG FILE COULD NOT BE READ**

Refer to ICDR TOPS procedures for further resolution.

**ICDR PARTITION COULD NOT BE OPENED**

Refer to ICDR TOPS procedures for further resolution.

**ICDR PARTITION COULD NOT BE WRITTEN**

Refer to ICDR TOPS procedures for further resolution.

**VTOC FILE COULD NOT BE OPENED**

Refer to ICDR TOPS procedures for further resolution.

**VTOC FILE COULD NOT BE READ**

Refer to ICDR TOPS procedures for further resolution.

For Format 3, no actions need to be taken.

- [3] REPT ICDR CONTROL FILE AUDIT  
TEMPORARY FILE COULD NOT BE CREATED

## 2. REASON FOR OUTPUT

To indicate the state of the international call detail recording (ICDR) control file after its audit has been run (Format 1), that the control file could not be opened or read (Format 2), or that the system could not allocate a temporary file to print the audit results (Format 3). This message is accompanied by a minor alarm.

## 3. VARIABLE FIELD DEFINITIONS

- a Start time in hours and minutes for teleprocessing.
- b Stop time in hours and minutes for teleprocessing.
- c Indicates whether or not the ICDR data transfer sessions have been manually inhibited via the INH:ICDR-SESSION message.
- d Indicates whether or not a teleprocessing session is currently in progress.
- e Indicates percentage of disk space containing primary data.
- f OPENED — Control file could not be opened.  
READ — Control file could not be read.

## 4. ACTION TO BE TAKEN

For Format 1, examine the values that the audit assigned to the fields in the control file. If any values need to be corrected, use the input messages listed under References.

If Format 2 prints, refer to the ICDR TOPS procedure for further resolution.

SEE PROPRIETARY NOTICE ON COVER PAGE

If Format 3 prints, use the OP:ICDR-CONTROL input message to check the contents of the control file. If any of the values are invalid, correct them using the input messages listed under references.

## 2. REASON FOR OUTPUT

To report an International Call Detail Recording (ICDR) disk writer related software error condition.

## 3. VARIABLE FIELD DEFINITIONS

- b                      Disk writer error type:
- 1 — Unexpected event received.
  - 2 — Unexpected message received.
  - 4 — Primary disk copy of disk map was corrupted.
  - 6 — Both disk copies of disk map were corrupted.
  - 7 — Could not allocate a message buffer.
  - 8 — Could not queue a message.
  - 9 — Could not attach the Equipment Configuration Database (ECD).
  - 10 — Could not release the ECD.
  - 11 — Could not read ucb record from ECD.
  - 12 — Could not read eaiopt record from ECD.
  - 13 — Could not read mdct record from ECD.
  - 14 — Could not get partition Logical Device Identification Number (LDIN) from file manager.
  - 15 — Could not read partition disk map.
  - 16 — Could not write partition disk map.
  - 17 — Could not write data from Shared Data Segment (SDS) buffer.
  - 18 — Configuration file open failed.
  - 19 — Configuration file read failed.
  - 20 — Configuration file audit failed.
  - 21 — Global map open failed.
  - 22 — Global map read failed.
  - 23 — Global map create failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 24 — Global map write failed.
- 25 — Global map audit failed.
- 26 — Global map was rebuilt.
- 27 — No Automatic Message Accounting (AMA) partitions are equipped.

c Additional information about the error:

If b = 4, 6, or 14 through 17,  
c = ICDR partition number to which message applies.

If b = 18 through 25,  
c = copy of file to which message applies:

BKUP — Backup copy.  
PRIM — Primary copy.

d Disk writer termination code:

- 1 — Could not connect to a message port.
- 2 — A terminate request was received from another process.
- 3 — Disk writer was faulted during initialization.
- 4 — Disk writer was faulted during an internal audit.
- 5 — Disk writer was faulted when it was running.
- 6 — Disk writer memory corruption detected.
- 8 — Too many unexpected faults received.
- 9 — IOBADMSG returned from the disk driver.
- 10 — FLT\_BADOST returned from the disk driver.
- 11 — BADPORT returned from a kportid kernel call.
- 21 — An internal sanity check failed.
- 22 — Both copies of configuration file were inaccessible or unusable.
- 102 — Too many type 2 errors.
- 104 — Too many type 4 errors.
- 106 — Too many type 6 errors.
- 107 — Too many type 7 errors.
- 108 — Too many type 8 errors.

e Hexadecimal number representing the fault code of the disk writer.  
See Output Appendix APP:DFC-F for a description of the fault codes.

f Hexadecimal number representing the virtual address if the writer was running.

g Number of blocks which have been marked to secondary data.

#### 4. ACTION TO BE TAKEN

If b = 6 or 9-17; d = 1, 9, or 22; or anytime format 4 is output, refer to ICDR TOPS procedures for further resolution. If any message appears several times, seek technical assistance.

## 2. REASON FOR OUTPUT

To report the potential loss of International Call Detail Recording (ICDR) data. A major, minor, or critical alarm may accompany this message.

## 3. VARIABLE FIELD DEFINITIONS

a                      Percentage of ICDR disk space occupied by primary data.

**NOTE:** If a = 70-89, a minor alarm occurs. If a = 90-99, a major alarm occurs. If a = 100, a critical alarm occurs.

## 4. ACTION TO BE TAKEN

Refer to ICDR TOPS procedures for specific instructions.

APPLICATION .. 4E,3B-APS  
TYPE ..... Output

## 1. FORMAT

REPT ICDR MONITOR a  
[b]  
[c]

## 2. REASON FOR OUTPUT

To print in response to an international call detail recording (ICDR) input message or an event detected by the ICDR monitor process.

## 3. VARIABLE FIELD DEFINITIONS

a                INIT COMPLETE — The ICDR monitor process was successfully started or restarted.

INIT FAILED — The ICDR monitor process was not successfully started or restarted.

CONTROL FILE CHANGE ABORTED — The control file was not updated because an ICDR session was in progress or because the control file was audited.

CONTROL FILE BACKUP FAILED — Indicates that the memory copy of the ICDR control file could not be backed up to disk; if this prints in response to an input message, the most recent change to the control file will probably not be permanent.

CONTROL FILE INITIALIZED — During initialization, the disk copy of the control file did not exist or was unreadable; a new control file was created and initialized with default values.

ICDR INDICATOR FILE INITIALIZED — The file which contains the ICDR indicator could not be opened. A new file was created and initialized.

INVALID MESSAGE RECEIVED FROM DISK WRITER — A disk occupancy message from the ICDR disk writer process contained garbled information. The disk occupancy information reported by the REPT ICDR DISK SUMMARY output message may no longer be accurate.

SANITY CHECK FAILURE — An internal sanity check failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

If a = INIT FAILED:

- b Reason for failure:
- COULD NOT CONNECT TO MESSAGE PORT
  - COULD NOT ENABLE MESSAGE RECEPTION
  - COULD NOT INITIALIZE CONTROL FILE
  - COULD NOT ATTACH TO PROTECTED APPLICATION SEGMENT
  - COULD NOT INITIALIZE ICDR RECORDING FILE
- c MONITOR TERMINATING AND RESTARTING AFTER 60 SECS

If a = ICDR INDICATOR FILE INITIALIZED:

- b INDICATOR MUST BE RESET

If a = CONTROL FILE CHANGE ABORTED:

- b Reason for abort:
- ICDR SESSION IN PROGRESS
  - CONTROL FILE WAS AUDITED

If a = CONTROL FILE INITIALIZED

- b OFFICE-DEPENDENT VALUES MUST BE RESET

If a = SANITY CHECK FAILURE:

- b Reason for failure:
- RECVW CALL FAILED
  - INTERNAL INCONSISTENCY FOLLOWING CONTROL FILE AUDIT
- c MONITOR TERMINATING AND RESTARTING AFTER 60 SECS

#### **4. ACTION TO BE TAKEN**

If a = INIT COMPLETE — Take no action.

If a = INIT FAILED, INVALID MESSAGE RECEIVED FROM DISK WRITER —  
Take no action for isolated instances. If the problem persists, seek technical assistance.

If a = CONTROL FILE CHANGE ABORTED and:

- b ICDR SESSION IN PROGRESS — Retry the operation after the ICDR session is complete.
- b CONTROL FILE WAS AUDITED — Verify that the control file is correct following the audit and retry the operation.

If a = CONTROL FILE BACKUP FAILED — The most recent changes to the control file may not be permanent and may have to be redone if the ICDR monitor process restarts for any reason. If the problem persists, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

If a = ICDR INDICATOR FILE INITIALIZED — Set the office-dependent indicator value (on or off).

If a = CONTROL FILE INITIALIZED — Set office-dependent data before any ICDR sessions are established. The control file will contain default values.

If a = SANITY CHECK FAILURE — Refer to the ICDR TOPS procedure.

SESSION STOP TIME k  
SESSION LENGTH l
- [2] REPT ICDR SESSION TERMINATED  
TEMPORARY FILE COULD NOT BE CREATED

## 2. REASON FOR OUTPUT

To report the termination of an international call detail recording (ICDR) teleprocessing session (Format 1). Format 2 indicates that the system could not create a temporary file to print the termination message.

## 3. VARIABLE FIELD DEFINITIONS

- a Type of termination:
- NORMAL
- ABNORMAL
- b Text phrase that prints if a = ABNORMAL.
- The text phrase indicates the reason the session terminated abnormally.
- c Sequence number of the first block transmitted.
- d Sequence number of the last block transmitted.
- e Total number of blocks transmitted.
- f Total number of ICDR records transmitted.
- g Total number of primary polls rejected.
- h Total number of secondary polls rejected.

SEE PROPRIETARY NOTICE ON COVER PAGE

- i Current amount of disk space occupied by primary data. Expressed as a percentage.
- j Start time of the session, where j = mmm dd hh:nn:ss, as follows:  
mmm — Start month.  
dd — Start day.  
hh — Start hour.  
nn — Start minute.  
ss — Start second.
- k Stop time of the session, where k = mmm ddd hh:nn:ss, as follows:  
mmm — Stop month.  
ddd — Stop day.  
hh — Stop hour.  
nn — Stop minute.  
ss — Stop second.
- l Session length, where l = hh:mm:ss, as follows:  
hh — Hours of session length.  
mm — Minutes of session length.  
ss — Seconds of session length.

#### **4. ACTION TO BE TAKEN**

Refer to ICDR TOPS procedures if the session terminated abnormally (a = ABNORMAL). If Format 2 was output, use input message OP:ICDR-SESSION to get information on the status of the session.

TYPE ..... Output

### 1. FORMAT

REPT IMS GENERIC  
RELEASE a

### 2. REASON FOR OUTPUT

This message identifies the generic and release of the IMS subsystem. It is automatically printed during IMS initializations and aborts.

This information is often essential in troubleshooting software. It should be included in all trouble reports. To see it without running an initialization, see the OP:RING input command.

### 3. VARIABLE FIELD DEFINITIONS

a                      Generic id. A line of text which identifies the version of the IMS software.

### 4. ACTION TO BE TAKEN

Include this information when reporting problems which may be affected by IMS software.

### 5. REFERENCES

Practice 234-151-120 *Trouble Clearing and Maintenance Procedures*

Input Message  
OP:RING

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:IMSDRV-AUD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

- [1] REPT IMSDRV AUD  
RTR REJECTED THE REQUEST TO RUN a b [c] AUDIT  
REPLY CODE = d
- [2] REPT IMSDRV AUD  
RTR REJECTED THE REQUEST TO BLOCK/UNBLOCK a b [c] AUDIT  
REPLY CODE = d
- [3] REPT IMSDRV AUD  
RTR ABORTED THE REQUEST TO RUN a b [c] AUDIT  
REPLY CODE = e
- [4] REPT IMSDRV AUD  
TIMEOUT FOR REQUEST TO RUN a b [c] AUDIT  
LAST REQUEST f MS AGO - LAST REPLY g MS AGO CODE = d

## 2. REASON FOR OUTPUT

Format 1 is printed when an audit requested by the IMS driver process could not be started, and the reply code indicates the reason is not transient.

Format 2 is printed when the IMS driver process could not block or unblock an audit.

Format 3 is printed when an audit requested by the IMS driver process was aborted before completion.

Format 4 is printed when the IMS driver process exceeded a time limit in the process of attempting to run an audit.

## 3. VARIABLE FIELD DEFINITIONS

- a The audit class name:
  - CNC — Central Node Control.
  - NODEST — Node State (Node Availability Map).
- b The audit member number (1).
- c The audit instance name or blank.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d                   The acknowledgement code from RTR:
- 1 — IMS has received no replies (acknowledgements).
  - 3 — Audit system initialization in progress.
  - 4 — Audit system initialization failed.
  - 5 — Access to audit record in the ECD failed.
  - 6 — Requested audit is running.
  - 7 — Another kernel process requested audit is running.
  - 8 — Maximum number of supervisor audits are running.
  - 9 — Requested audit instance is blocked.
  - 10 — Attempt to init or dispatch audit failed.
  - 11 — An audit with the same name is running.
  - 12 — Audit running in demand mode, cannot block.
  - 13 — Audit running requested, cannot stop & block.
  - 14 — Requested audit or instance is inhibited.
  - 15 — System Integrity Output Formatter is dead.
  - 19 — Invalid audit specified.
  - 20 — Invalid audit instance specified.
  - 21 — Mode of request not permitted.
  - 22 — Cannot stop an audit that is not running.
  - 23 — Cannot stop a non-segmented kernel audit.
  - 30 — Request resulted in no change.
- e                   The termination status from RTR:
- 2 — Aborted by the user.
  - 3 — Aborted by the audit.
  - 4 — Aborted by fault -- possible damage.
  - 5 — SIM abort -- failed to dispatch audit.
  - 6 — SIM abort -- audit control / interface failure.
  - 7 — SIM abort -- audit exceeded time or segment limit.
  - 8 — SIM abort -- aborted by stop-and-block request.
  - 9 — Transient audit process died.
  - 10 — Segmented audit exceeded an error threshold.
- f                   How long (ms) before the timeout the last request was sent.
- g                   How long (ms) before the timeout the last reply was received.

#### 4. ACTION TO BE TAKEN

Format 1:

If the acknowledgement code from RTR is 14 — Issue the ALW:AUD command for the audit specified in the fields a, b, and c to allow the audit to be run.

If the acknowledgement code from RTR is 19 — Check the audit class name and member number specified in the "auderr", "audinst", and "audrec" records in the ECD for the audit indicated by the fields a and b.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the acknowledgement code from RTR is 20 — Check the audit instance name specified in the "audinst" record in the ECD for the audit indicated by the fields a and b.

Seek technical assistance if any other value for the acknowledgement code from RTR is printed.

Format 2:

If the acknowledgement code from RTR is 19 — Check the audit class name and member number specified in the "auderr", "audinst", and "audrec" records in the ECD for the audit indicated by the fields a and b.

If the acknowledgement code from RTR is 20 — Check the audit instance name specified in the "audinst" record in the ECD for the audit indicated by the fields a and b.

Seek technical assistance if any other value for the acknowledgement code from RTR is printed.

Format 3:

If the termination status from RTR is 3 — Should only occur while IMS is aborting.

If the termination status from RTR is 6 — Can be caused by ECD errors, such as indicating not segmented for a segmented audit in the "audrec" form for the audit indicated in fields a and b.

Seek technical assistance if any other value for the termination status from RTR is printed.

Format 4:

If the time of the timeout since the last request was sent is less than time of the timeout since the last reply was received, then the timeout was because no reply was received for the last request to run the audit. A reply is expected when the request is rejected or completed.

If the time of the timeout since the last request was sent is greater than time of the timeout since the last reply was received, then the last request to run the audit was rejected for the acknowledgement code from RTR, and the time limit on retrying was exceeded.

If the time of the timeout since the last request was sent is equal to time of the timeout since the last reply was received and the acknowledgement code from RTR is 1, it indicates that all attempts to send the request failed and the time limit on retrying was exceeded.

Seek technical assistance.

- [3] REPT IMSDRV FLT  
REGISTERS AT RTC=g:  
0 'X'h i j k  
4 'X'l m n o  
8 'X'p q r s

## 2. REASON FOR OUTPUT

The IMS driver process (imsdrv.p) has encountered a hardware or software fault.

Format 1 is printed when the IMS driver process was not executing at the instant the fault was encountered or there is no saved execution state. The latter case applies to UNIX® RTR level 1 initializations, fault X'E1, which flushes the stack.

Formats 2 and 3 are printed together to describe the execution state of the IMS driver process at the instant the fault was encountered.

## 3. VARIABLE FIELD DEFINITIONS

- a Hexadecimal number which is the sum of the codes for all UNIX® RTR events outstanding for the IMS driver process. (These are defined in UNIX® RTR header file evflag.h. Those described there as "USR" events are described in more detail in the IMS header file ims\_event.h.

**NOTE:** The contents of the latter varies in different systems.

- b The UNIX® RTR fault code. Values X'B1 through X'BA are related to I/O between the 3B and peripheral units controlled by the IMS driver process, such as RPCNs. Values X'BC through X'BD are related to message buffer audit faults. Values X'A0 through X'A2 are DIOP (disk) status changes on RTR release 1; for RTR release 6, values X'B0, X'BE, and X'BF are related DIOP status changes. Values X'C3 through X'C9 are configuration reports and are typically related to the peripheral faults. Values X'D1 through X'D9 are related to software

SEE PROPRIETARY NOTICE ON COVER PAGE

- errors. Values X'E0 through X'E2 are related to RTR system initializations. (Values are defined in UNIX® RTR header file fault.h)
- c If this is present, then the IMS driver process was in execution at this virtual address when the fault was encountered.
- d The contents of the 3B CU register PSW.
- e The contents of the 3B CU register PSBR.
- f The contents of the 3B CU register SSBR.
- g The content of the 3B CU real time clock register in 1-msec units. A message pair (one each of Formats 2 and 3 printed at the same time) will show the same value.
- h-s The contents of 3B CU registers %r0-%r10, respectively.

#### 4. ACTION TO BE TAKEN

Analyze the fault code b. If the header files are not available see the REPT-IODRV output messages for similar material.

If the fault is associated with I/O to RPCN(s), there will be other messages giving more details.

If the fault is not attributed to a hardware problem, seek technical assistance and specify the exact software version.

Note to technical support personnel:

Analysis of the program address c is the key to further analysis. It will indicate which part of the IMS driver was in execution. Some parts of the IMS driver are the responsibility of subsystems other than IMS. This analysis must usually be performed by application technical support personnel rather than IMS personnel because it requires access to an unstripped copy of the exact version of the imsdv.p file and, frequently, the other source and object files and libraries which were used in building it.

MIN-MODE INHIBITED a  
REQ c  
AT e

## 2. REASON FOR OUTPUT

Formats 1-4 are progress reports for initialization and abort sequences of the Interprocess Message Switch (IMS) subsystem.

Format 5 indicates that the IMS subsystem encountered a situation which would normally have resulted in an initialization, but the initialization was inhibited because IMS was in min-mode.

## 3. VARIABLE FIELD DEFINITIONS

- a                    The particular initialization or abort sequence:
- ABORT SEQUENCE
  - BOOT INITIALIZATION PROLOGUE
  - CRITICAL LEVEL 2 INITIALIZATION
  - CRITICAL LEVEL 3 INITIALIZATION

SEE PROPRIETARY NOTICE ON COVER PAGE

CRITICAL LEVEL 4 INITIALIZATION

FPI INITIALIZATION PROLOGUE

LEVEL 0 INITIALIZATION

LEVEL 1A INITIALIZATION

LEVEL 1B INITIALIZATION

NON-CRITICAL PROCESS CREATIONS

- b If present, this item indicates IMS is IN MIN-MODE. (See REPT:MIN-MODE output message.) This will not appear with BOOT INITIALIZATION PROLOGUE or with FPI INITIALIZATION PROLOGUE because it isn't known at that time.
- c Request code (1-15). Reason initialization sequence was requested. See APP:APPENDIX-07 output appendix for specific values.
- d Escalation flags (0 - X'FFFF). If this is not zero, it indicates the reason(s) that a request for an initialization sequence resulted in a more severe initialization or abort than requested. See APP:APPENDIX-07 output appendix for specific values.
- e The value of the 3B20D/3B21D's real time clock register in 1 millisecond units. The time elapsed between two events which print these messages can be determined by subtracting the time values from the two messages.
- f The name of the failing phase of the initialization sequence. See APP:APPENDIX-07 output appendix for a dictionary of these names.
- g Indicates what progress had been made for the failing phase.
  - 0 — Sequence requested but not started.
  - 1 — Starting or ending phase.
  - 2 — Waiting for phase completion.
  - 3 — Pausing after completion of phase.
  - 4 — Pausing before retry of phase.
  - 5 — No sequence in progress.
- h A failure code (0-18) indicating the type of failure which caused the initialization sequence to abort. See APP:APPENDIX-07 output appendix for specific values.

#### 4. ACTION TO BE TAKEN

Analyze in context with surrounding messages, including initializations of other subsystems. In many cases these output messages will be the expected result of initializations of UNIX® RTR or other subsystems.

SEE PROPRIETARY NOTICE ON COVER PAGE

When successful, the BOOT INITIALIZATION PROLOGUE sequence and the FPI INITIALIZATION PROLOGUE sequence lack completion messages because they lead directly into one of the other sequences.

When these messages are found to be unexpected, seek technical assistance.

An alarm will sound based on the initialization level or abort sequence:

ABORT SEQUENCE — A Major alarm sounds.

FPI INITIALIZATION PROLOGUE — A major alarm sounds.

LEVEL 1A INITIALIZATION — A minor alarm sounds.

LEVEL 1B INITIALIZATION — A minor alarm sounds.

## 1. FORMAT

This message has six formats.

- [1] REPT IN PBUF (IN PROGRESS)  
C C C C C C C.  
TYPEVALUADDRNEW\_DATAOLD\_DATA  
abcdef
- [2] REPT IN PBUF ABORTED - g
- [3] REPT IN PBUF COMPLETED
- [4] REPT IN PBUF (rptable) CANNOT OPEN h
- [5] REPT IN PBUF (rptable) OUTDATED OWBUFFER DATE = i
- [6] REPT IN PBUF (rptable) INVALID OWBUFFER

## 2. REASON FOR OUTPUT

Format 1 indicates the values used with IN:PBUF command. If the OLDDATA option is not used, no value is printed. However, if the L option is not used, the default value will be 1.

Format 2 is a general format of information due to errors detected. This information is meant to be self-explanatory.

Format 3 indicates completion of command.

Formats 4 through 6 indicate that a problem exists in reading the DISKFILE or a problem with the data entries.

## 3. VARIABLE FIELD DEFINITIONS

- a Overwrite type (UID, PID, PMEM, or KERN).
- b Process or utility ID.
- c Address to be overwritten, corresponding to overwrite type.
- d Full word of new data.
- e Full word of old data; default value is (ffffffff).
- f Number of words; default value is (1).

SEE PROPRIETARY NOTICE ON COVER PAGE

- g Supplemental data describing the problem found.
- h Indicates DISKFILE name.
- i Indicates date of outdated owbuffer.

#### **4. ACTION TO BE TAKEN**

All DISKFILE failures should be reported to the Technical Support Organization.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT INH RCV APPDB ACTIVE

## 2. REASON FOR OUTPUT

During the intervals when the "DLN Inhibit" feature is active (i.e., GTT10D RCV is inhibited due to potential RCV software problems that are causing total DLN outages), this 4ESS output message will print on the system ROP on a 15-minute basis. The output message prints with a MINOR alarm status.

The message is also output when the trigger in RC:MISC initially activates the "DLN Inhibit" feature. In this case, the output message is printed with a MAJOR alarm status.

The "DLN Inhibit" feature can be deactivated via the ALW:RCV-APPDB input command. HOWEVER, it is HIGHLY recommended that the cause of the inhibit activation be studied and determined before it is deemed "safe" to allow GTT10D recent change.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

Call NESAC.

ID ..... REPT:INHADM  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT INHADM UNABLE TO MAINTAIN INHIBITS
- [2] REPT INHADM FAULTED FCODE a
- [3] REPT INHADM UNABLE TO SEND INHIBIT  
MESSAGE TO DRIVER b
- [4] REPT INHADM CANNOT GET UCB RECORD
- [5] REPT INHADM MINOR ALARM FROM INHIBIT  
ADMINISTRATOR

## 2. REASON FOR OUTPUT

For Format 1, to report that the inhibit administrator process attempted to maintain consistency of the error interrupt inhibits between the Emergency Action Interface (EAI) and the Unit Control Blocks (UCBs) in the Equipment Configuration Database (ECD) during an initialization, but failed to access the ECD or could not send a message to a driver. The error interrupt inhibit options selected by the EAI must be propagated to the ECD on any initialization to ensure consistency.

For Format 2, the inhibit administrator received the fault code.

For Format 3, the inhibit administrator does not inhibit a device directly, it sends a message to the corresponding driver. This error indicates that the "queuemn" system call failed when sending to the driver with Process ID (PID).

For Format 4, an ECD access function (either `lla_opensq` or `lla_nextseq`) failed when accessing a UCB record.

For Format 5, inhibiting hardware checks, software checks, and error interrupts can prevent the system from recovering automatically from hardware or software faults. This error is printed when any of the checks are inhibited as a warning to the user.

## 3. VARIABLE FIELD DEFINITIONS

- a Fault code received by INHADM. See the Fault Code Output Appendix, APP:FAULT-CODE.
- b PID of driver.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For Formats 1-4, run ECD audits. If there are no errors in the ECD, then seek technical assistance. For format 5, no action is required.

- [13] REPT INIT 3BN ERR  
UNEXPECTED ERR BEFORE NP RESTART DMA, NODE = a b,  
STATE = k, SOURCE = f

SEE PROPRIETARY NOTICE ON COVER PAGE

## 2. REASON FOR OUTPUT

Format 1 is printed when the shut down DMA job fails.

Format 2 is printed when an interrupt is received by the 3B with an illegal internal interrupt number.

Format 3 is printed when an interrupt is received by the 3B with an illegal physical node ID.

Format 4 is printed when the command clear interrupt fails.

Format 5 is printed when the command sense 3BI status fails.

Format 6 is printed if test DMA fails for the specified node.

Format 7 is printed when the 3B node interrupted 3B while it is undergoing the DMA initialization sequence yet the internal substate of this node does not appear to expect such an interrupt.

Format 8 is printed when the 3B node interrupted 3B, yet the node is not currently undergoing the DMA initialization sequence.

Format 9 is printed when the DMA initialization sequence on the specified node times out.

Format 10 is printed when the DMA initialization sequence detects that the application of IMS did not provide the address for the expanded DMA map table.

Format 11 is printed if any of the hardware commands executed during the DMA shutdown sequence fails.

Format 12 is printed if any of the hardware commands executed fails right after the test DMA procedure has passed.

Format 13 is printed if any of the hardware commands executed fails before NP restarts DMA fails.

**NOTE:** A 3B node is defined to be a node that is not an RPC and yet connected directly to the 3B.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                        |
|---|--------------------------------------------------------|
| a | The 3B Node name (e.g., DLN) and group number (00-63). |
| b | The 3B Node member number (1-15).                      |
| c | Internal sequence number for technical error tracking. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- d The internal interrupt number for this 3B node. This is possibly an illegal interrupt number.
- e The physical node ID for this 3B node. This is possibly an illegal physical node ID.
- f The source of the request for the DMA init job:  
2 — From ring node restore.  
8 — From diagnostic.
- g The reason for timeout:  
2 — Test DMA timeout.  
4 — NP restart DMA timeout.  
8 — Overall job timeout.
- h The error status, if **i** has the value 0, cannot cancel DMA restart timer:  
1 — Detach interrupt failure.  
2 — Clear ddsbs failure.  
3 — Cannot send reset 3BI pio.  
4 — Sense status command failure.  
5 — Should never be this value.  
6 — If **i** has the value 0, send STOP DMA pio failure.  
If **i** has a value other than 0, cannot cancel overall timer.  
7 — If **i** has the value 0, cannot cancel overall timer.  
If **i** has a value other than 0, cannot cancel DMA restart timer.  
8 — Only valid when **i** has the value 0.
- i Leftover PIO indicator. If the value is 0, there was no leftover PIO command in the 3BI register for the NP when DMA shutdown took place. Otherwise, there was some leftover PIO command. This item is for technical information only.
- j The error status:  
1 — If **f** has the value 8, cannot setup timer.  
If **f** has the value 2, fail to program MAC to the user's area.  
2 — Only valid when **f** has the value 2.  
If **f** has the value 2, cannot send test DMA ack pio.  
3 — Only valid when **f** has the value 2.  
If **f** has the value 2, cannot switch interrupt handler.  
4 — Only valid when **f** has the value 2.  
If **f** has the value 2, cannot setup timer.
- k The error status:  
1 — Attach interrupt failure.  
2 — Clear ddsbs failure.  
3 — Cannot send reset 3BI pio.  
4 — Enable interrupt failure.  
5 — Cannot send NP restart DMA pio.  
6 — Cannot setup timer.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

Formats 1, 4, 5, 7, 8:

Using normal maintenance procedures, the 3B node should be diagnosed and then restored to service. Messages of Format 8 can also be printed as a result of node initiated restart. If this is the case, there should be other ARR/ACNR messages (see REFERENCES) indicating this fact; and there is no action to be taken by user.

Formats 2, 3:

If any 3B node is removed as a result of the interrupt, use normal maintenance procedures, diagnose and restore to service.

Formats 6, 10:

Use normal maintenance procedures and contact appropriate IMS application organization personnel.

Formats 9, 11, 12, 13:

Use normal maintenance procedures, diagnose the 3B node. If ATP, contact IMS technical personnel and restore the node to service.

**NOTE:** The Automatic Ring Recovery (ARR) routine, unless inhibited, will attempt (up to 3 times) automatic recovery of OOS 3B nodes if the node maintenance state is not marked MANUAL.

## 2. REASON FOR OUTPUT

To report an Input/Output Processor (IOP) related software error.

## 3. VARIABLE FIELD DEFINITIONS

- a Single character for device type. See the CIC Select Code 303-007, *Processor Recovery Message Guide*, Appendix D.
- b Real time stamp in eight alphanumericals.
- c Single character for the unit number in hexadecimal.
- d Alphanumeric location code indicating calling function:
  - 1 — iocccerror
  - 2 — cserror
  - 3 — sserror
  - 4 — dserror
  - 7 — pcnotequip
  - 8 — pcommoff
  - a — prtfault
  - 10-13 — kfault
  - 15 — procfmsg
  - 16 — callphase
  - 17 — iopfatal
  - 18 — iop1fatal
  - 19 — feaioprm
  - 20 — seaioprm
- e Error code.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f Additional error code for debugging in hexadecimal.
- g Additional error code for debugging in hexadecimal.
- h Field contains a four-digit (hexadecimal) error code. Error codes are defined in IOP Output Appendix F, APP: IOP-F.
- i Field contains a four-digit (hexadecimal) code of 2400. This indicates that the PC community is powered down.
- j Field contains a one- or two-digit (hexadecimal) fault code. Fault codes are defined in IOP Output Appendix E, APP: IOP-E.
- k Field contains a single-digit panic code:
- 1 — Encountered a fault while handling a fault.
  - 2 — Excessive S/W faults.
  - 3 — Excessive unrecoverable errors while processing a fault.
  - 4 — Excessive unrecoverable errors while processing a fault where the IOPs were affected but not implicated.
- l Field contains a two-digit (hexadecimal) code that represents the function within a major step. This is the same code that would be found in digits 4 and 5 of the Process Recovery Message (PRM), function within a major step (also known as PRM number), had the PRM been issued. The meanings of these codes can be found in the *Process Recovery Messages Guide* by finding the IOP Driver PRM (digit 1 is a 7) with the indicated function-within-a-major-step, and reading the PRM description.

#### 4. ACTION TO BE TAKEN

An error report is indicative of an error condition which could result in the removal of a unit. Units that are removed should be repaired and restored to service.

ID ..... REPT:IUN-INIT  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

- [1] REPT IUN INIT  
IUN LEVEL 2-3 INITIALIZATION COMPLETED  
a IUNS PLACED IN ACTIVE STATE b IUNS IN THE SYSTEM
- [2] REPT IUN INIT  
IUN LEVEL 4 INITIALIZATION STARTED
- [3] REPT IUN INIT  
INITIALIZATION OF IUNS OF TYPE c COMPLETED  
d IUNS PLACED IN THE ACTIVE STATE  
e IUNS EQUIPPED
- [4] REPT IUN INIT  
IUN LEVEL 4 INITIALIZATION COMPLETED
- [5] REPT IUN INIT  
IUN INITIALIZATION IN PROGRESS

## 2. REASON FOR OUTPUT

Format 1 is printed at the conclusion of the level 2-3 IMS User Node (IUN) initialization sequence, which is part of an IMS level 2 or 3 initialization.

Format 2 is printed at the start of the level 4 IUN initialization (pump - download - of IUN(s)) sequence, which is part of an IMS level 4 initialization.

Format 3 is printed when the restore of a group of IUN(s), all having one or more files in common, has completed. There may be one or more occurrences of this message. The first instance of a format 3 message will follow a format 2 message. This message will only be printed during an IMS level 4 initialization.

Format 4 is printed when the level 4 IUN initialization (pump - download - of IUN(s)), which is part of an IMS level 4 initialization, is finished.

Format 5 is printed when an initialization of a group of IUN(s), all having one or more files in common, is in progress and has not completed. This message will occur approximately every 2 minutes until the initialization of this group of IUN(s) is finished.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a Number of IUN(s) placed in the active state.
- b Number of equipped IUN(s) in the system.
- c Name of a group of IUN(s), all having one or more files in common (generic spec file name).
- d Number of IUN(s), in this group, placed in the active state.
- e Number of equipped IUN(s) in this group.

### 4. ACTION TO BE TAKEN

Formats 2, 4, 5: None

Format 1, 3: If the number of IUN(s) placed in the active state is less than the number of IUN(s) equipped, normal maintenance procedures should be used, after the initialization is finished, to restore any out-of-service (OOS) IUN(s).

**NOTE:** The Automatic Ring Recovery (ARR) routine, unless it is inhibited, will attempt automatic recovery of OOS IUN(s) shortly after the level 4 IMS initialization has completed.

## 1. FORMAT

- [1] REPT IUN PUMP  
ABORTED PUMP OF IUN a b  
REASON = c, CONTROL CODE = d
- [2] REPT IUN PUMP  
ABORTED PUMP OF IUN ???e b  
REASON = c, CONTROL CODE = d

## 2. REASON FOR OUTPUT

Format 1 is printed if pump of the operational code or the diagnostic code to a single IUN is aborted.

Format 2 is printed if pump of the operational code or the diagnostic code to a single IUN is aborted and the ring node name could not be determined.

## 3. VARIABLE FIELD DEFINITIONS

- a The Ring Node (RN) name (e.g., LN) and group number (00-63).
- b The Ring Node member number (1-15).
- c The reason why the pump job is aborted:
- 1 — Received a source-matched pump message.
  - 2 — Received a returned pump message.
  - 3 — Insufficient message switch buffer space.
  - 4 — Failed to get message switch buffer space.
  - 5 — Failed to determine best route to node.
  - 6 — Obtained a bad channel from best route.
  - 7 — Failed to build relay header.
  - 8 — Failed to build IMS message header.
  - 9 — Failed to write message.
  - 10 — Failed to relay message.
  - 11 — Time out waiting for relay response message.
- d The internal control code primarily intended for BTL use.
- e The group number (00-63).

## 4. ACTION TO BE TAKEN

If the reason the pump job was aborted is 1 or 2, use normal maintenance procedures to run IUN diagnostic.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the reason the pump job was aborted is 3, wait a few minutes, then try to perform the same restore or diagnostic action again. If the same messages are printed frequently during a 24-hour period, seek technical assistance.

If the reason the pump job was aborted is 10, use normal maintenance procedure to run IUN diagnostic; seek technical assistance if the same messages are printed repeatedly with the reason pump job was aborted is 10.

Seek technical assistance if any other value for the reason the pump job was aborted was printed.

  - 9 — Failed to allocate internal timer.
  - 10 — Failed the DMA initialization request.
  - 11 — Failed to change IUN major state to Active (ACT).
  - 13 — Failed the DMA initialization request.
  - 14 — Failed the DMA initialization due to a fault.
  - 15 — Failed the DMA initialization request.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 16 — Restart timed out waiting for AP response.
  - 17 — Failed due to an AP error.
  - 18 — Failed to allocate internal timer.
  - 19 — IUN not in active ring.
  - 20 — IUN restart aborted by request.
  - 21 — Failed to allocate internal timer.
  - 22 — IUN restart guard timer expired.
  - 23 — Failed to change IUN major state to INIT.
  - 24 — Failed to restore create RI paths message.
- d           The internal error code primarily intended for BTL use.
- e           The IUN AP restart failure code:
- 50 — AP restart threshold has been exceeded.
  - 51 — AP restart failed.
  - 52 — AP restart timed out.
  - 53 — AP restart aborted by request.
  - 54 — Failed to allocate internal timer.
  - 56 — Failed to change IUN major state to INIT.
  - 57 — IUN does not have major state of ACT.
  - 58 — IUN not in the active ring.
  - 59 — AP restart timed out.
  - 60 — Failed to change IUN major state to ACT.
  - 61 — Failed to allocate internal timer.
  - 62 — Failed the DMA initialization request.
  - 63 — Failed the DMA initialization request.
  - 64 — Failed the DMA initialization due to a fault.
  - 65 — Failed to change IUN major state to ACT.
  - 66 — Failed the DMA initialization.

#### 4. ACTION TO BE TAKEN

Format 1: None.

Formats 2, 3: Using normal maintenance procedures, the IUN should be restored to service.

## 2. REASON FOR OUTPUT

Format 1 is printed if a single IUN failed to be restored to service.

Format 2 is printed if a single IUN failed to be restored to service and the ring node name could not be determined.

Format 3 is printed if a group of IUN(s) fail to be restored to service during a Level 4 IMS initialization.

Format 4 is printed if there are zero (0) Node Processors (NPs), in this group of IUN(s) eligible to be sent a message which will cause the IUN NP(s) to be available for service. This message will only be printed during a Level 4 IMS initialization.

Format 5 is printed if there are zero (0) Attached Processors (APs), in this group of IUN(s) eligible to be sent a message which will cause the IUN AP(s) to be available for service. This message will only be printed during a Level 4 IMS initialization.

Format 6 is printed if an IUN is undergoing a DMA channel initialization while being restored during a Level 1B IMS initialization. The IUN will be left out of service.

Format 7 is printed if an IUN is undergoing a DMA channel initialization while being restored during a Level 1B IMS initialization and the ring node name could not be determined. The IUN will be left out of service.

Format 8 is printed if a restore is in progress and IMS is notified that a DMA channel error, associated with the IUN, has occurred. The IUN will be left out of service.

Format 9 is printed if a restore is in progress and IMS is notified that a DMA channel error, associated with the IUN, has occurred and the ring node name could not be determined. The IUN will be left out of service.

Format 10 is printed if a restore of an IUN is started using the RST:a b;GSFN filename;UCL command and the restore is stopped before completing. In most cases the IUN will be left out of service.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                                                                                                           |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | The Ring Node (RN) name (e.g., LN) and group number (00-63).                                                                                                                                                                              |
| b | The Ring Node member number (1-15).                                                                                                                                                                                                       |
| c | The failure code: <ul style="list-style-type: none"><li>1 — IUN restore job failed to complete.</li><li>15 — IUN restore job was aborted.</li><li>43 — IUN restore job was stopped however, a retry of the restore may succeed.</li></ul> |

SEE PROPRIETARY NOTICE ON COVER PAGE

- d                   The internal job state at the time of restore failure:
- 1 — Waiting for an IUN NP reset command to complete.
  - 2 — Trying to unquarantine the IUN NP(s).
  - 3 — Trying to send the IUN NP its ROM patch load.
  - 4 — Sending (downloading) the IUN NP(s) a common program or data file.
  - 5 — Sending (downloading) an IUN NP a file or files destined only for that IUN (e.g. an IUN specific data file).
  - 6 — Sending the IUN NP(s) a command to execute the downloaded program.
  - 7 — Sending the IUN NP the name of the Generic Spec File it was downloaded from, 3B paths data and RI paths data.
  - 8 — Waiting for the IUN NP(s) to receive a selective broadcast setup message.
  - 9 — Sending the IUN NP(s) the name of the Generic Spec File they were downloaded from.
  - 10 — Sending the IUN NP(s) 3B paths data.
  - 11 — Sending the IUN NP(s) RI paths data.
  - 12 — Done with executing IUN NP(s).
  - 13 — Waiting for the IUN AP reset to complete.
  - 14 — Polling the IUN AP reset status.
  - 15 — Done with the IUN(s) AP reset.
  - 16 — Waiting for the IUN NP(s) to receive a selective broadcast setup message.
  - 17 — Sending (downloading) the IUN AP(s) a common program or data file.
  - 18 — Sending (downloading) an IUN AP a file or files destined only for that IUN (e.g., an IUN specific data file).
  - 19 — Sending the IUN AP(s) a command to execute the downloaded program.
  - 20 — Done with executing IUN AP(s).
  - 21 — Changing the IUN(s) major state to the active state.
  - 22 — Initializing an IUN's DMA channel.
  - 23 — Auditing the IUN(s) major and minor states.
  - 24 — Failed to restore a group of IUN(s), place all IUN(s) out of service.
  - 25 — Aborting this restore job.
- e                   The group number (00-63).
- f                   Name of a group of IUN(s), all having one or more files in common (generic spec file name).

SEE PROPRIETARY NOTICE ON COVER PAGE

g                   The reason the restore of the IUN was stopped:

                  FAILED - ABORT REQUEST OR ERROR

                  MIRA ABORTED RESTORE BY REQUEST

                  MIRA FAILED - CAN'T SPAWN DIAMON

                  MIRA FAILED - INTERNAL PROBLEM

                  MIRA FOUND DUPLICATE RESTORE REQUEST ALREADY QUEUED

                  MIRA OUT OF BUFFERS

                  MIRA RESTORE SOURCE INHIBITED

                  RESTORE REQUEST TIMED OUT

#### 4. ACTION TO BE TAKEN

Formats 1, 2, 6, 7, 8, 9:

Using normal maintenance procedures, the IUN should be diagnosed and then restored to service.

Format 3, 4, 5:

If the number of IUN(s) placed in the active state is less than the number of IUN(s) equipped, as reported by the Level 4 IMS IUN initialization message (see REPT : IUN-INIT output message), normal maintenance procedures should be used, after the initialization is finished, to diagnose and restore any Out of Service (OOS) IUN(s).

Format 10: Take the action based on the reason the restore of the IUN was stopped:

If MIRA ABORTED RESTORE BY REQUEST — The restore request was aborted by request i.e. STOP:DMQ. Resubmit the restore request.

If MIRA FOUND DUPLICATE RESTORE REQUEST ALREADY QUEUED — The restore request is a duplicate of already queued maintenance request. No action need be taken, since the LN will be restored by the existing maintenance request.

If MIRA FAILED - ABORT REQUEST OR ERROR,  
MIRA FAILED - CAN'T SPAWN DIAMON, or  
MIRA FAILED - INTERNAL PROBLEM — An error was encountered by the MIRA subsystem. Verify it is working correctly then resubmit restore request.

If MIRA OUT OF BUFFERS — The MIRA subsystem is out of buffers (slots) to queue maintenance requests. When a buffer becomes free then resubmit the restore request. OP:DMQ can be used to see the contents of MIRA's buffers.

If MIRA RESTORE SOURCE INHIBITED — The source (ISR) of the RST:a b;GSFN filename;UCL command is inhibited. Perform the command: ALW:DMQ;SRC ISR and resubmit restore request.

If RESTORE REQUEST TIMED OUT — The restore did not finish before a timer expired. This may be due to other LN maintenance activity. An attempt will be made to abort the restore request. The status of the restore can be verified with the OP:DMQ

SEE PROPRIETARY NOTICE ON COVER PAGE

command. If the original restore request is still active it should be stopped using the **STOP:DMQ** command. Also check (**OP:DMQ**) for other LN maintenance activity (active or queued). If there is LN maintenance activity wait until it has completed then resubmit the restore request, otherwise resubmit the restore request.

**NOTE:** The Automatic Ring Recovery (ARR) routine, unless it is inhibited, will attempt automatic recovery of Out Of Service (OOS) IUN(s) shortly after the Level 4 IMS initialization has completed.

- [11] REPT KLLA UPDATE MAP OVERLOAD FOR g
- [12] REPT KLLA FILENAME TOO LONG k
- [13] REPT KLLA LLA ERROR CODES m
- [14] REPT KLLA LLA DATA SEGMENT ERROR

## 2. REASON FOR OUTPUT

To report status or error conditions in the process /prc/klla.

Format 1 reports that a task was faulted or timed out.

Format 2 reports that /prc/klla faulted while not in a task.

Format 3 reports that a database is in a stop and flush mode. Output approximately every five minutes while the stop and flush is in effect.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 4 reports that an attempt to recover from a fault has failed and that the database is being related.

Format 5 reports that no living process remains attached to a database and therefore the database is being released.

Format 6 reports an error in adding or freeing dynamic memory.

Format 7 reports that a shared segment cannot be unshared.

Format 8 reports that a memory lock that was stuck has been cleared.

Format 9 reports that a lock on a database that was stuck has been cleared.

Format 10 reports that bad links were found in the message queue for a database and the queue has been repaired.

Format 11 reports that the capacity of the update map for a database has been exceeded.

Format 12 reports an attempt to build a database file name that would contain more than fourteen characters.

Format 13 reports internal LLA errors.

Format 14 reports internal KLLA error in administering the LLA library data segment associated with a task.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                                                                                               |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | Reason for terminating the task, PHASE 1, FAULT or TIMEOUT.                                                                                                   |
| b | Process number of the process requesting the task.                                                                                                            |
| c | Type of request being serviced.                                                                                                                               |
| d | If a is PHASE 1 or FAULT, the address at which the task was faulted with the fault code in the first two hex digits. If a is TIMEOUT, the task sleep address. |
| e | Fault code.                                                                                                                                                   |
| f | Address in /prc/klla at which fault occurred.                                                                                                                 |
| g | Name of the database.                                                                                                                                         |
| h | Error code returned by the memory manager.                                                                                                                    |
| j | Segment index of the affected segment.                                                                                                                        |
| k | Name of the file.                                                                                                                                             |
| m | A string of mnemonic LLA error codes separated by commas.                                                                                                     |

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

Format 4,5: When a format 4 or 5 message appears, further KLLA access to that database will be denied until a new attach request is made.

Format 6: The following messages indicate a failure to allocate memory for the database environment because of a shortage of memory resources:

```
REPT KLLA ADD SEGMENT ERROR = X'ef
REPT KLLA ADD SEGMENT ERROR = X'ed
REPT KLLA GROW SEGMENT ERROR = X'fb
```

Retry the attached request when the memory shortage is cleared.

Any other SEGMENT ERROR message is an indication of a failure in KLLA's management of dynamic memory. Report this error to UNIX® RTR support.

Format 7: This is a failure in KLLA's management of shared memory. Report this error to UNIX® RTR support.

Format 8-10: These messages report errors found and repaired by internal audits of KLLA's structures. They are useful for explaining a possible slowdown or deadlock in KLLA processing. Frequent appearance of these messages should be reported to UNIX® RTR support.

Format 11: This warns that the capacity of the updated map structure has been exceeded. If this error occurs frequently, pass this information to the UNIX® RTR support organization.

Format 13: This message contains useful debugging information for UNIX® RTR developers.

Format 14: This message reports a failure to set up the proper addressing for a task. The task involved will eventually be torn down with a TIMEOUT. Frequent appearance of this message should be reported to UNIX® RTR support.

ID ..... REPT:LACID-ERROR  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

REPT LACID ERROR  
NODE a LINK\_ID b LACID c:

## 2. REASON FOR OUTPUT

Prints when the LACID table audit has failed. The LACID table audit checks the data in the LACID table (lcd\_tbl[]) with the incore link node data (lndata). This audit is part of the LKBDST audit and runs whenever the LKBDST audit is scheduled to run. This audit runs to completion for all DCHN and SADC type nodes.

## 3. VARIABLE FIELD DEFINITIONS

- a Ring Node Address (RNA).
- b Link within this RNA.
- c Incore LACID value for this link.
- d One of the following error messages:
  - 1 RNA/PLID MISMATCH BETWEEN INCORE LNDATA AND LACID TBL
  - 2 LACID TBL RNA - PLID OUT OF RANGE
  - 3 NODETYPE NOT A DCHN OR SADC FOR THIS RNA
  - 4 LACID MISMATCH BETWEEN INCORE LNDATA AND LACID TBL
  - 5 BAD LACID ROUTING: SAME LACID ASSIGNED TO MORE THAN ONE RNA/PLID

## 4. ACTION TO BE TAKEN

This output message is printed to indicate to the user that there was a mismatch between the Incore link node data and the data in the LACID Table when the LACID audit (lcd\_aud()) was run. The audit corrects the error when appropriate and then updates the corresponding link nodes accordingly via REMACS.

For error messages 2, 3 and 4, the RNA/PLID is set to zero in the LACID table which means that this LACID value becomes unequipped. For error message 1 the LACID table is updated to reflect the Incore LNDATA. For error message 5 no correction is done. This message indicates that there are two or more links that have the same LACID value. The user must verify the Link Node Data via the RC/V tools and make appropriate corrections to the Link Node Data. The AUD:LKBDST must then be run such that the LACID table audit can run again and correct the data in the LACID table.

LFS b c REQUEST ABORTED  
[o]

## 2. REASON FOR OUTPUT

Format 1 reports at completion of EXC:LFS test.

Format 2 reports abnormal EXC:LFS test terminations.

## 3. VARIABLE FIELD DEFINITIONS

- a Link group number (0-63).
- b Link member number (1-15).
- c Number of loopback components (LC) specified in the EXC:LFS command line.

TEST sequence progression specifier:

NEAR — Indicates link fault sectionalization (LFS) test started from the nearest specified loopback component to the farthest.

FAR — Indicates LFS test started from the farthest specified loopback component to the nearest.

- d Loopback point to which the test sequence has progressed. Must be one of the following:

CSUL — Channel service unit latching loopback.

SEE PROPRIETARY NOTICE ON COVER PAGE

CSUN — Channel service unit non-latching loopback.

DPuu — Indicates the uuth digital signal zero (DS0) data port relative to the near-end. The uu is a number in the range: (01-50).

DSUL — Digital service unit dataport latching loopback.

DSUN — Data service unit non-latching loopback.

LID0 — Indicates test sequence has not progressed beyond the local loopback test.

NEI — Far-end network element interface. (Loopback select code octet value = x1000001).

OCUL — Office channel unit latching loopback.

OCUN — Office channel unit non-latching loopback.

REM — Manual remote loopback.

RPT1 — Represents non-latching loopback test for the first 56K bps local loop regenerative repeater.

RPT2 — Represents non-latching loopback test for the second 56K bps local loop regenerative repeater.

e Disposition of the test. Must be one of the following:

ERROR THRESHOLD EXCEEDED.  
FARTHER AWAY LOOPBACK POINT(S) FAILED.  
LID0 COMPOSITE CLOCK FAILURE.  
LID0 LOCAL LOOPBACK TEST FAILURE.  
LID0 MALFUNCTION.  
LID0 MEASUREMENT COUNTERS SATURATED.  
LID0 SOFTWARE MALFUNCTION.  
PASSED.  
TOO MANY LOST SYNCHRONIZATIONS.  
UNABLE TO ALIGN ON RETURNED TEST PATTERN.  
UNABLE TO OPERATE LOOPBACK.  
UNABLE TO RE-ALIGN AFTER LOST SYNC.  
UNABLE TO REMOVE LOOPBACK.  
WRONG FACILITY COMPONENT LOOPED BACK.

f Loopback component (LC). Must be one of the following:

CSUL, CSUN, DSUL, DSUN, NEI, REM, RPT1 and RPT2 DPuu, where uu is a number in the range: (01-50).

g Repetitive (>1) or single (1) operation. Must be a value in the range: (1-99).

| l | Bit error ratio (BIT-ERT) for this loopback point. Expressed as one of the following:<br><br>- x.yE-z<br>- UNFLW to indicate underflow.<br>- OVFLW to indicate overflow.<br><br>Where x, y and z are integer values in the range (0-9).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| m | Percent error free seconds (PCT E-F-S) for this LC. Also represented as a fixed point with precision = 0.1%.<br><br><b>Note:</b> The BIT-ERT and PCT E-F-S values in an intermediate report could be worse than the specified threshold, but the test will not necessarily fail (yet). This is due to a difference in the way calculations are done for reporting vs. thresholding. For example, the reported BIT-ERT is calculated by dividing the number of errored bits by the total number of bits from the start of the test up to the time of the calculation (elapsed time). For thresholding, the denominator is always the number of bits for the entire specified duration. Thresholding is done in this way so that the test is not overly sensitive to bit errors early in a long test. |
| n | Number of lost synchronization for the loopback point (0 to 999).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 1. FORMAT

REPT LIBC ARGUMENTS TO FUNC a UTID: b  
c

## 2. REASON FOR OUTPUT

To report arguments to the faulting function and to the function that called the faulting function.

## 3. VARIABLE FIELD DEFINITIONS

- a Address of the faulting instruction or the caller of the faulting function.  
This will identify the function to which these arguments refer.
- b Utility ID of the process that faulted.
- c List of arguments to the function (maximum of 14) from the stack.

## 4. ACTION TO BE TAKEN

This is a supplementary message to REPT:LIBC-FAULT. No separate action is required if actions are taken for REPT:LIBC-FAULT message.

## 5. REFERENCES

## 2. REASON FOR OUTPUT

To report that a UNIX® process was overlaying itself with another image and an unexpected error occurred.

Format 1 is printed when a new segment could not be added to the address space.

Format 2 is printed when a new segment could not be allocated.

Format 3 is printed when the process attributes could not be changed.

Format 4 is printed when the process class could not be set.

Format 5 is printed when chgpcb failed when setting the profiling address. MAXSEG error occurs when the chgpcb ost fails to change the segment list size when executing a child with a different number of segments than the parent. PCBSIZE error occurs when the pcb could not be grown or shrunk for the new process identified in FNAME.

Format 6 is printed when a shared library file header contained bad data.

Format 7 is printed when a shared library file could not be read.

Format 8 is printed when a shared library file could not be opened.

Format 9 is printed when the new process image's file contained invalid shared library data.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 10 is printed when a segment name template could not be obtained for a shared library file.

Format 11 is printed when a segment index in the file header was invalid.

Format 12 is printed when a segment overlay in the process being executed.

Format 13 is printed when the PCB data in the file header was invalid.

Format 14 is printed when a segment image could not be read from a file.

Format 15 is printed when a segment number for a new segment could not be found.

Format 16 is printed when the stack data in the file header was invalid.

Format 17 is printed when a temporary segment could not be added to the address space.

Format 18 is printed when a temporary segment could not be allocated.

### **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                                                              |
|---|------------------------------------------------------------------------------------------------------------------------------|
| a | Segment number of the one that could not be attached.                                                                        |
| b | Name of the file in which the error happened. In some cases, the name will have the utility Identification (ID) as a prefix. |
| c | Process name from the Process Control Block (PCB). For some cases, this may be NULL.                                         |
| d | Process number.                                                                                                              |
| e | Utility ID.                                                                                                                  |
| f | Size of the requested segment.                                                                                               |
| g | Name of the requested segment.                                                                                               |
| h | Priority requested.                                                                                                          |
| i | Time slice requested.                                                                                                        |
| j | Shared library bits.                                                                                                         |
| k | Shared library bits.                                                                                                         |
| l | Class requested.                                                                                                             |
| m | Profiling address, or the new segment list size, of the new PCB size.                                                        |
| n | Name of the shared library.                                                                                                  |
| o | Magic number in file header.                                                                                                 |
| p | Magic number in a.out header.                                                                                                |
| q | Number of segment maps.                                                                                                      |

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                        |
|---|------------------------------------------------------------------------|
| r | System error code. See System Error Codes Output Appendix, APP:SYSERR. |
| s | Invalid path data.                                                     |
| t | Segment index of bad segment in pfile.                                 |
| u | File's invalid segment descriptor.                                     |

#### **4. ACTION TO BE TAKEN**

File an operational trouble report accompanied by the message. Many conditions indicate a file whose data have been damaged.

#### **5. REFERENCES**

ID ..... REPT:LIBC-FAULT  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT LIBC FAULT IN a FLTCODE b PA c  
PNAME:d PID:e UTID:f

## 2. REASON FOR OUTPUT

To report that a UNIX® process caused a software fault that made it terminate.

## 3. VARIABLE FIELD DEFINITIONS

- a                    A general indicator of what caused the fault:
- LIB — The UNIX® portion of the library.
- USER — The process itself.
- SBTRACE — The stack back trace execution.
- b                    Fault number.
- c                    Program address at which the fault occurred. In some cases, this value may point to the next instruction.
- d                    Process name from the Process Control Block (PCB).
- e                    Process number.
- f                    Utility ID of the process that faulted.

## 4. ACTION TO BE TAKEN

File an operational trouble report accompanied by REPT:LIBC-FAULT, REPT:LIBC-PROGRAM, REPT:LIBC-SAVE, and REPT:LIBC-ARGU output messages. In some cases, a file is created in /cdmp that contains an image of the process when it terminates. The file's name will be the same as variable field showing the process name from the PCB in the output message.

If the general indicator is USER and the fault number is 0xe1 (H'e1), a phase 1 has occurred, and the currently running supervisor or UNIX® process (indicated by process name from the PCB) is killed by sending it a phase fault (0xe1). This is part of the phase 1 recovery process, and the process is reporting that it has received a fault. The postmortem should be analyzed to determine the cause of the phase 1. If bit 31 of the Process Status Word (PSW) in the postmortem is 0xa1 and the process indicated in variable field showing the process name from the PCB was dumped into /cdmp, then save the core dump for analysis.

PNAME:a PID:b UTID:c
- [5] REPT LIBC ERROR FORK PFORK2 FAILED  
PNAME:a PID:b UTID:c

## 2. REASON FOR OUTPUT

To report that an error prevented a UNIX® process from creating a new process with the fork system call.

Format 1 is printed when the process could not duplicate all segments of its address space.

Format 2 is printed when the process could not add the new Process Control Block (PCB) segment to its address space.

Format 3 is printed when the process could not create a copy of its PCB segment.

Formats 4 and 5 are printed if the new process could not be created because of other system limitations. This condition may be temporary.

## 3. VARIABLE FIELD DEFINITIONS

- a Process name from the PCB.
- b Process number.
- c Utility Identification (ID).
- d Return value from an unsuccessful request.

## 4. ACTION TO BE TAKEN

If the condition persists, file an operational trouble report accompanied with the output message.

SEE PROPRIETARY NOTICE ON COVER PAGE

SLK a b i j REQUEST DENIED,  
SLM IS NOT IN GOOD STATE FOR LINK CHECK
- [41] REPT LKC SLK COMPL  
SLK a b i j LINK CHECK UNGRACEFULLY REMOVED
- [42] REPT LKC SLK COMPL  
SLK a b i j LINK CHECK REQUEST FAILED,  
TIMED OUT AWAITING NODE RESPONSE
- [43] REPT LKC SLK COMPL  
SLK a b i j NODE OOS, MANUAL LINK CHECK BYPASSED

## 2. REASON FOR OUTPUT

Response to a manual request for a Link Check test procedure.

Formats 1 through Format 17 are for DCHN & SADC only.

Formats 18 through Format 43 are for ILN links only.

SEE PROPRIETARY NOTICE ON COVER PAGE

40000 — Ring/3B up / down.  
50000 — Level 2 restarted during a link check.  
60000 — Bad start parameters.  
70000 — Receiving data does not match with transmitting data.  
80000 — LI silent.  
90000 — An internal link check has started, but timed out awaiting result back.  
a0000 — Automatic link check request failed, awaiting ACK to the request from the node.

k

Time (in seconds) since the beginning of the test.

l3\_msg\_x — number of level 3 messages transmitted.  
l3\_msg\_r — number of level 3 messages received.  
no\_chgov — number of change over (failed).  
lk\_oos\_t — number of 100ms during which the link is out of service.  
l2\_msu\_x — number of MSUs level 2 has transmitted.  
l2\_msu\_r — number of MSUs level 2 has received.  
no\_force — number of forced retransmission.  
no\_for\_b — number of bytes transmitted during forced retransmission.  
r\_abort — number of aborts.  
r\_abrter — octet count which is added to SERM.  
s\_errsec — number of severe error second.  
errsec — number of error second.  
crc\_er — number of SUs that have CRC errors.

#### 4. ACTION TO BE TAKEN

Formats 1, 3, 4, 6, 7, 8, 9, 14: No action necessary.

Format 2: A Link Check Internal test has failed. Faulty links should be repaired as soon as possible.

Format 5: A Link Check test has failed. Faulty links should be repaired as soon as possible.

Formats 10-12: A Link Check test procedure was already in progress when the current request was entered. Since no more than one Link Check procedure may be active at one time for a given link, the active procedure must be stopped or allowed to complete. Test may be requested after the active test is complete or stopped.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 13: A Link Check test procedure was requested when the maximum number of tests allowed were in progress. The test may be submitted once an active test completes, or an active test may be stopped. The user must be careful when stopping a loopback test to be sure that a far-end office is not using the loopback.

Formats: 18, 20, 23, 25, 26, 27, 28: No action necessary.

Format 19: Link check internal failed. Replace the LI4D if the REASON field is not 2xxxx. Check cable connections if it is 2xxxx, typically true when it is 20002.

Format 21: This message tells that the last test for a given link check has not detected any failure, and does not guarantee that there has not been any failure over the link checking. One should look at the measurement NO\_CHGOV for number of failures and other data to determine whether the link is capable of being used.

Format 22: Depending on the code of the field REASON, one of the following action is suggested to be taken:

- 1xxxx — Replace the LI4D.
- 2xxxx — Same as the action taken for format 4.
- 30000 — Call the remote to set up the loop.
- 40000 — Retry a new link check.
- 50000 — Retry a new link check.
- 60000 — Check the node code.
- 70000 — Call the remote to set up the loop.
- 80000 — Replace the LI4D.
- 90000 — Replace the LI4D.
- a0000 — (apply to automatic link check only).

Format 24: This is the response to a request of link check status.

Formats 29-31: A Link Check test procedure was already in progress when the current request was entered. Since no more than one Link Check procedure may be active at one time for a given link, the active procedure must be stopped or allowed to complete. Test may be requested after the active test is complete or stopped.

Format 32: Maximum number of link checks is limited by tty's available, try it again when one of on-going checks is done.

Formats 33-36: Response from a status request

Formats 37-39: Not in a right state, change state before trying it again.

Format 40: Normally, a manual request will be granted when the link state is in MOOS or some of OOS(EMR). For OOS(EMR), it also depends on the state Signaling Link Management is in.

Format 41: For some reasons, a node that is exercising link check may be removed. The message simply tells one that his link checking is stopped.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 42: For some reasons, the node does not respond within a time limit when the node is in service.

Format 43: A link check request was given when the node was in service. An expected ACK from the node is not received within timeout. Recheck the node, and it is found out of service.

ID ..... REPT:LN  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

REPT LNa b IS c

## 2. REASON FOR OUTPUT

To report the new state of a Link Node (LN). The new state change may only be entered through a manual request from UNIX® RTR Recent Change and Verify (RC/V).

A minor alarm sounds whenever an LN is removed from service.

## 3. VARIABLE FIELD DEFINITIONS

a                    A Ring Node (RN) group number (00-63).  
b                    The ring node member number (1-15).  
c                    New State:  
  
                     IN THE GROWTH STATE  
  
                     OFFLINE  
  
                     OUT OF SERVICE  
  
                     UNAVAILABLE  
  
                     UNEQUIPPED

## 4. ACTION TO BE TAKEN

Verify that this state transition occurred because of a UNIX® RTR RC/V action.

## 1. FORMAT

This message has one output format:

REPT LOG a b c d  
e

## 2. REASON FOR OUTPUT

This message is output to a logfile to record certain data or code execution to supplement the analysis of system failures. These messages are intended primarily for use by AT&T Bell Laboratories.

## **2. REASON FOR OUTPUT**

To report the result of executing a COPY:LSNC command.

Formats 1-12 indicate normal operational output messages.

Formats 13-37 indicate an error has occurred and the explanation of the error.

## **3. VARIABLE FIELD DEFINITIONS**

- |   |                                                       |
|---|-------------------------------------------------------|
| a | Number of the 1B file.                                |
| b | Number of the generic.                                |
| c | Number by pair of TAN's in decimal.                   |
| d | Number of the TSN's in decimal.                       |
| e | 1B Stat file is initialized in hex. (Expect f0ff0fff) |

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                          |
|---|----------------------------------------------------------|
| f | Lock or Unlock bit. (Locked = 1 : Unlocked = 0)          |
| g | Normal or Update mode. (Normal = 1 : Update = 2)         |
| h | Indicates which 1B file (1B file 0 = 0 : 1B file 1 = 1). |
| i | Number of the TAN in octal.                              |
| j | The number of the TSN in octal.                          |
| k | The address in octal.                                    |
| l | Index into the csfs maps.                                |
| m | Phase within the program where the error occurred.       |
| n | The type of error which occurred.                        |
| o | The name of the file which caused the error.             |
| p | The number of the error.                                 |

#### **4. ACTION TO BE TAKEN**

If formats 23 and 24 appear as output, seek technical assistance. For all other formats 13-37, fix the error and reenter the command. If errors still persist, seek technical assistance.

ID ..... REPT:MAN-RING-MOD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

REPT MANUAL RING MODE  
WARNING: ECD SPECIFIES MANUAL RING MODE

## 2. REASON FOR OUTPUT

This message is printed periodically when IMS is in the manual ring mode but the ring is no longer down and the ring initialization has been done successfully. It is printed when the stated condition is first met and every 30 minutes thereafter as long as the condition remains the same. This message is to remind the user that the IMS automatic recovery is inhibited.

## 3. VARIABLE FIELD DEFINITIONS

None

## 4. ACTION TO BE TAKEN

When the user is ready to return to normal mode, the ECD manual ring mode flag must be reset to null.

## 5. REFERENCES

None.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT MAXINTVL a

## 2. REASON FOR OUTPUT

To report the utility Identification (ID) of a process which requested a time-out exceeding the maximum allowable value.

## 3. VARIABLE FIELD DEFINITIONS

a                      Utility ID of process requesting time-out.

## 4. ACTION TO BE TAKEN

The timeout request, by default, will succeed unless failure is requested via the (s)maxintvl call. The process may use the (s)maxintvl call to eliminate the message.

ID ..... REPT:MBD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

[1] REPT MBD DATA 1-1  
00000000

[2] REPT MBD DATA a-b  
C C C C C C C C  
C C C C C C C C

## 2. REASON FOR OUTPUT

To print system message buffer data when the disk driver message buffer contains invalid data.

Format 1 prints when the disk driver message buffer pointer is NULL.

Format 2 prints when a critical field in the disk driver message buffer is considered to be invalid.

The Message Buffer Dump (MBD) will always contain the disk driver message buffer that is considered invalid. If it exists, message buffer data preceding the disk driver message buffer will also be printed.

The maximum amount of data printed is the size of the largest message buffer plus the size of the smallest message buffer followed by the disk driver message buffer. The boundaries between message buffers contained in the dump are determined by interpreting the data.

## 3. VARIABLE FIELD DEFINITIONS

a Current print segment number.  
b Total number of print segments in this report.  
c Message buffer data in hexadecimal notation.

## 4. ACTION TO BE TAKEN

Save a copy of the Receive-Only Printer (ROP) and contact your technical support organization.

## 5. REFERENCES

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:MEAS-DUMP  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

This message has three formats.

- [1] REPT MEAS DUMP MSG  
INVALID IMS MESSAGE RECEIVED  
a
- [2] REPT MEAS DUMP MSG  
INVALID IMS MESSAGE RECEIVED (continued)  
a
- [3] REPT MEAS DUMP MSG  
THE MESSAGE:  
"INVALID IMS MESSAGE RECEIVED"  
OCCURRED b TIMES IN THE PAST c MINUTES

## 2. REASON FOR OUTPUT

To report that an unexpected message has been received.

Format 1 is used when the unexpected message is short. It will accommodate messages up to 14 words (4 octets per word, 7 words per line). If a message is longer than 14 words, it will be continued with another message of Format 2.

Format 2 prints continuation of message printed as Format 1. It will also accommodate continuations of up to 14 words and will be repeated as many times as necessary to dump the complete message.

To limit the number of messages being printed on the ROP, a limit has been placed on the total number of messages that will be printed within a particular time period. This limit has been set to 5 messages per 5-minute period. If the total number of requests for a particular description of an error exceeds this limit, the message will not be printed and a message of Format 3 will be printed at the end of the period.

## 3. VARIABLE FIELD DEFINITIONS

- a The message dumped in hexadecimal.
- b The number of times the message should have been printed during the last time period.
- c The time period over which the message should have been printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

It is not intended that the contents of this output message be analyzed by the on-site work force. Rather it is an indication that the CMMSADM process has received a message which it cannot decipher or an extremely rare or unexpected event has occurred. The contents of this message can greatly enhance the analysis of certain service-affecting events and as such, the message may be of great benefit to field support organizations.

#### **5. REFERENCES**

None.

- [11] REPT MHD a INFO HA SHADOW REGISTER STATUS t
- [12] REPT MHD a INFO CODE u
- [13] REPT MHD a SJR DATA v w x y z

## 2. REASON FOR OUTPUT

To specify the error condition detected on the Moving Head Disk (MHD).

Format 13 provides Small Computer System Interface (SCSI) Job Response (SJR) information when an explicit SCSI command, built by the Disk File Controller (DFC) driver, fails. The SJR data is necessary to determine the exact cause of the error condition.

## 3. VARIABLE FIELD DEFINITIONS

- a Unit number.
- b Command completion code. See Tables 1 and 2 in DFC Output Appendix B, APP:DFC-B.
- c Number of disk blocks read or written.

See DFC Output Appendix E, APP:DFC-E.                                                                                                                                                                                                                                                                                                                                         |
| j | Bus Interface Controller (BIC) status, in hexadecimal. See DFC Output Appendix F, APP:DFC-F.                                                                                                                                                                                                                                                                                                                       |
| k | BIC status, in hexadecimal. See DFC Output Appendix F, APP:DFC-F.                                                                                                                                                                                                                                                                                                                                                  |
| l | Mask.                                                                                                                                                                                                                                                                                                                                                                                                              |
| m | Expected value of BIC status after being masked with mask given.                                                                                                                                                                                                                                                                                                                                                   |
| n | Supplemental data for previous REPT-DKDRV message.                                                                                                                                                                                                                                                                                                                                                                 |
| o | Fault code, in hexadecimal. See DFC Output Appendix I, APP:DFC-I.                                                                                                                                                                                                                                                                                                                                                  |
| p | First word of an unidentifiable completion report. This would normally be the command completion word.                                                                                                                                                                                                                                                                                                             |
| q | Second word of an unidentifiable completion report. This would normally be the device status word.                                                                                                                                                                                                                                                                                                                 |
| r | Autonomous response special completion code. See Tables 1 and 2 in DFC Output Appendix B, APP:DFC-B.                                                                                                                                                                                                                                                                                                               |
| s | The special completion code hexadecimal digit provides the reason for the autonomous response. See Table 3 in DFC Output Appendix B, APP:DFC-B.                                                                                                                                                                                                                                                                    |
| t | The SCSI Host Adapter (HA) shadow register status, in hexadecimal. See DFC Output Appendix P, APP:DFC-P.                                                                                                                                                                                                                                                                                                           |
| u | Information code. See DFC Output Appendix A, APP:DFC-A.                                                                                                                                                                                                                                                                                                                                                            |
| v | Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.<br><br>AAAA = SCSI Job Block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, APP:DFC-K.<br><br>BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, APP:DFC-K.<br><br>CC = Fill. Not used. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- w First word of Extended Sense Data (ESD). See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 0 of ESD.
  - BB = Byte 1 of ESD.
  - CC = Byte 2 of ESD.
  - DD = Byte 3 of ESD.
- x Second word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 4 of ESD.
  - BB = Byte 5 of ESD.
  - CC = Byte 6 of ESD.
  - DD = Byte 7 of ESD.
- y Third word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 8 of ESD.
  - BB = Byte 9 of ESD.
  - CC = Byte 10 of ESD.
  - DD = Byte 11 of ESD.
- z Fourth word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 12 of ESD.
  - BB = Byte 13 of ESD.
  - CC = Byte 14 of ESD.
  - DD = Byte 15 of ESD.

#### **4. ACTION TO BE TAKEN**

An error report indicates an error condition which could cause the removal of a unit. Any removed unit should be repaired and restored to service. Additional messages may be output which provide useful data.

If Format 13 prints, the SCSI drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

TYPE ..... Output

## 1. FORMAT

REPT MIN-MODE  
IMS IS IN MIN-MODE

## 2. REASON FOR OUTPUT

This message is printed periodically when IMS is in min-mode to remind the user that the IMS automatic recovery is inhibited.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

When the user is ready to return to normal mode, IMS must be rebooted without the min-mode option.

[21] REPT MIRA CANNOT RESERVE UNITS FOR a b c [d e]

## **2. REASON FOR OUTPUT**

To report one of the conditions encountered by the Maintenance Input Request Administrator (MIRA).

Format 1 indicates that all slots in the MIRA queue are taken.

Formats 2 and 21 indicate that the Unit Control Block (UCB) for the unit is reserved.

Format 3 indicates that MIRA could not change to a different UNIX® priority.

Format 4 indicates that MIRA could not to open the Equipment Configuration Database (ECD) manager.

Format 5 indicates that the ECD manager failed to locate the top UCB for the request.

Format 6 indicates that the UCB for the requested unit was not found by the ECD manager.

Format 7 indicates that MIRA could not create a child process.

Format 8 indicates that a STOP command has been received but there are no units queued.

Format 9 indicates that MIRA could not enable message reception.

Format 10 indicates that the message tag is invalid.

Format 11 indicates that an error in the message reception occurred.

Format 12 indicates that MIRA could not send a message to a process.

Format 13 indicates that MIRA could not connect to port 2.

Format 14 indicates that the UCB for the unit Identification (ID) in a diagnostic abort was not found by the ECD manager.

Format 15 indicates that MIRA could not execute the command in a message.

Format 16 indicates that an abort of an active diagnostic has been initiated by MIRA.

Format 17 indicates that the input command ALW:DMQ;RUN was entered while normal execution of diagnostics was allowed.

Format 18 indicates that the unit cannot be diagnosed or restored because it is a software device.

Format 19 indicates that there is no unit queued of the type requested in the STOP message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 20 indicates that the UCB for the unit ID in the EX request was not matched, no action was taken.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                                                                                                                                                                                                                   |

| b | Unit name.                                                                                                                                                                                                                                                                                                                                        |
| c | Unit number.                                                                                                                                                                                                                                                                                                                                      |
| d | Subunit name.                                                                                                                                                                                                                                                                                                                                     |
| e | Subunit number.                                                                                                                                                                                                                                                                                                                                   |
| f | System error number. See System Error Codes Appendix, APP:SYSERR.                                                                                                                                                                                                                                                                                 |
| g | Name of process in directory /diag/dgnc.                                                                                                                                                                                                                                                                                                          |
| h | Reason code for the diagnostic abort:<br><br>0 — STOP:DMQ command entered.<br><br>1 — Abort request received from the DMERT fault recovery process.<br><br>2 — Software diagnostic abort request was received.<br><br>3 — Operating system signal received by MIRA.<br><br>4 — Timeout message received from diagnostic timer (dgntimer) process. |

### 4. ACTION TO BE TAKEN

For Format 1, wait until a slot is available (see OP:DMQ input message) or remove a request from the queue. See STOP:DMQ or input message. If problem persists, seek technical assistance.

For Formats 2 and 21, actions should be taken in the order given. If the problem persists, do the next action on the list.

|             |                  |
|-------------|------------------|
| <b>Step</b> | <b>Procedure</b> |
|-------------|------------------|

- |   |                                                                                                                                                                                                                                                                                             |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Wait until the UCB is no longer reserved. The unit specified in the diagnostic request may be in use by another process. Both INIT:MHD (initialize moving head disk) and UPD:GEN (generic update) reserve units. Verify that these processes are not active. Retry the maintenance request. |
| 2 | Enter RMV:unit a! where unit is the unit name and a is the unit number from the original maintenance request. Retry the maintenance request.                                                                                                                                                |
| 3 | Enter AUD:ECDOWN 1! to run the ECD audit. Retry the maintenance request.                                                                                                                                                                                                                    |
| 4 | Enter: OP:STATUS-PROCESS,ALL! Record the identifications for all processes named "ppdiamon," "cudiagc," "iodiag," and "dfdiag".<br>Enter STOP:EXC:ANY,PID a! to kill these processes.<br>Enter AUD:ECDOWN 1! to run the ECD audit. Try the maintenance request again.                       |

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 Repeat Step 4 using the commands: Enter: STOP:EXC;USER,PID a,SIG 9!, This generates a kill that cannot be caught or ignored. Use of this command will result in the need to reinitialize ularp. INIT:ULARP will restart all monitored processes.
- 6 If problems persist, seek technical assistance.

For Format 3, MIRA can change its priority if it is spawned with a command line parameter of prty=x, where  $-39 \leq x \leq 39$ . MIRA's priority then becomes default priority minus 6x. When x is negative, the priority increases. When x is positive, the priority decreases. In no case will MIRA's priority rise above 191 or go below zero. MIRA's command line can be found in the file /etc/ularpfile. The typical error causing this output will be an out-of-range command line prty value.

For Format 4, verify that the file /dev/ecd exists and the access permissions are correct.

For Formats 5 and 6, verify that a valid unit name was entered on the input request. Examine the UCB of the unit requested for correctness, using the recent change and verify command RCV:M;BROWSE.

For Format 7, verify that process g exists in the directory /diag/dgnc and is executable. This failure also occurs if insufficient swap space exists.

For Format 8, 12, 14, 16, 17, 18, and 20, no action is required.

For Formats 9 and 13, no action is required. MIRA will terminate and be restarted by UNIX® Level Automatic Restart Process (ULARP).

For Formats 10, 11, 15, and 19, if a manual input command preceded this message, retry the input command.

ID ..... REPT:MKDSK  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT MKDSK PLEASE MOUNT NEXT TAPE IN SEQUENCE  
REMEMBER TO PLACE TAPE DRIVE ONLINE  
TO RESTART TYPE MKSTART
- [2] REPT MKDSK STILL WAITING FOR NEXT TAPE IN SEQUENCE  
REMEMBER TO PLACE TAPE DRIVE ONLINE  
TO RESTART TYPE MKSTART

## 2. REASON FOR OUTPUT

Format 1 is output when another tape should be mounted when multiple tapes are being read.

Format 2 reports that mkdsk has not terminated, and the next tape should be mounted.

## 3. VARIABLE FIELD DEFINITIONS

See Reason For Output.

## 4. ACTION TO BE TAKEN

Mount the next tape in the sequence. If the user waits more than five minutes to mount the next tape, the process will terminate and must be restarted.

GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT MMGR001 BAD DKDRV STAT a

## 2. REASON FOR OUTPUT

To report that the memory manager has received an acknowledgement message with an invalid response field from the disk driver. Legal responses are: success, failure, retry or bad message. The memory manager, not sure of how to proceed, will retry the input/output request.

## 3. VARIABLE FIELD DEFINITIONS

a                      Offending status code, in decimal notation.

## 4. ACTION TO BE TAKEN

There is a software coding error. Unless the condition causing the unusual return clears spontaneously, recovery in the field is remote. Submit an operational trouble report accompanied by the printout of this message.

## 5. REFERENCES

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT MMGR002 EXCESSIVE RETRIES FOR I/O SWAP  
SEGID a RETRIED b TIMES

## 2. REASON FOR OUTPUT

To report that the disk driver has returned a message status of 'retry' an unexpectedly large number of times. This message is repeated every 20 times a retry message is received until the Input/Output request is satisfied.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Segment Identification (ID) of the segment being swapped. Useful in debugging.
- b                      Number of times this was retried.

## 4. ACTION TO BE TAKEN

There is trouble in the disk driver. The swapping function of memory management is probably not working while this condition continues. Diagnose the moving head disk.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT MMGR003 ADD [EXTENDED] MEMORY FAILED. AVAILABLE MEMORY = a PAGES  
ATTEMPTED TO GROW MEMORY TO b PAGES  
[MUST REGEN SYSTEM TO ADD MEMORY]

## 2. REASON FOR OUTPUT

To report that a request to make some added memory available for system use failed. Recent Change/Verify (RC/V) had requested that the memory manager make some added memory available for system use.

## 3. VARIABLE FIELD DEFINITIONS

- a Amount of usable memory, in pages. One page = 2048 bytes.
- b Number of pages that RC/V attempted to make available for system use.

## 4. ACTION TO BE TAKEN

If RC/V attempts to increase the memory size beyond the maximum memory size specified during system generation, the memory manager will attempt to grow memory to a pages (Usable memory should equal the system generation specified maximum memory size). To increase this size, the system must be resysgened, and the computer rebooted to use the additional memory. However, if this is not desirable, then the system can be left to run with the original amount of memory.

If RC/V attempts to add memory beyond the physical size of memory the attempt will fail. For Very Large Main Memory (VLMM) the physical size of memory is 32768 pages; for Expanded Main Memory (EMM) it is 16384; otherwise, it is 8192. Number of pages that RC/V attempted to make available for system use is greater than 32768 pages, and indicates a faulty RC/V request.

Number of pages that RC/V attempted to make available for system use is less than or equal to usable memory, then a request was made to add memory with the memory size being equal to the old size or smaller. This could be caused by an error when entering RC/V commands.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT MMGR004 SWAP SPACE REQUEST FAILED  
AVAIL BLKS = b REQUESTED BLKS = a

## 2. REASON FOR OUTPUT

Swap disk space is allocated to new segments as they are created, and each segment must get contiguous blocks on the disk. This raises the possibility of fragmentation. That is, there might be enough free space for any given segment, but no single set of contiguous free blocks is large enough by itself. Instead of denying a space request immediately, the Memory Manager will attempt to re-arrange the disk space of existing segments. This can be done reasonably cheaply for all segments that happen to be in main memory at the time.

This message is produced when such a compaction has been done. However, the request that triggered the compaction could NOT be satisfied, even after the compaction.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                     |
|---|-----------------------------------------------------------------------------------------------------|
| a | The size, in 512-byte disk blocks, of the failing request.                                          |
| b | The size, in 512-byte disk blocks, of the largest free contiguous extent ("hole") after compaction. |

## 4. ACTION TO BE TAKEN

If this message occurs, a request for swap space has been denied. This implies that some process was unable to function properly. Urgent action to be taken includes:

1. Request a more effective but more expensive compaction using the AUD:MMGR input message. This may be postponed until a time when the load is lighter.
2. If the message persists, more disk space may be required. This entails a regeneration of the system, and a re-boot.

**NOTE:** The automatic compaction will not be attempted, and this message will not appear, if the system is in a state of absolute swap disk overload (output message REPT-SIMCHK 602 A6 has appeared).

MTRP: AUTOMATIC DATA DUMP FOR RNA=c

## 2. REASON FOR OUTPUT

**NOTE:** MON\_TRAP refers to the permanent Message Trap process at the 3B. EBD refers to the Enhanced Buffer Dump process at the 3B. The EBD process mentioned in this output message is a child process of MON\_TRAP.

Format 1: A SET:TRAP input message has been entered and processed successfully. When it is time to start the trap, MON\_TRAP cannot do so due to the reason being displayed. Any trap entry belonging to this trap is removed from the message trap database.

Format 2: A SET:TRAP input message has been entered and processed successfully. When it is time to start the trap, an attempt is made to start the trap on all the given link nodes. However, one of the link nodes sends a negative acknowledgement back to the 3B with the reason being displayed. Hence, MON\_TRAP will remove that link node from the list of link nodes belonging to this trap.

Format 3: A SET:TRAP input message has been entered and processed successfully. When it is time to start the trap, an attempt is made to start the trap on all the link nodes specified in the SET:TRAP input message. This format results when MON\_TRAP is not able to start trap on one or more of the given link nodes. This format gives a listing of the nodes that MON\_TRAP fails to start the trap on. The trap would have started on the remaining nodes.

Format 4: A SET:TRAP input message has been entered and processed successfully. This format results when MON\_TRAP is able to start the trap successfully on one or more of the link nodes specified in the SET:TRAP input message. The trap is in an active state.

Format 5: A trap has gone to completion gracefully. One of the completion criteria (i.e., message count and duration) has been satisfied. The trap is in a completed state.

Format 6: A trap and its trap entry have been removed from the message trap database. Its trapped results, if any, have been lost. For instance, this will occur when a completed, aborted or terminated trap has been on the message trap database for more than 24 hours.

Format 7: A trap has terminated with the reason of termination being displayed. The trap is in a terminated state.

Format 8: A trap has aborted with the reason of termination being displayed. The trap is in an aborted state.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 9: MON\_TRAP has removed the last link node from the list of link nodes belonging to this trap due to the reason being displayed, thereby causing the trap to abort.

Format 10: During a status check procedure, MON\_TRAP finds that the trap ID recorded in the link node is different from the trap ID recorded for that link node in the message trap database at the 3B. MON\_TRAP then aborts the trap.

Format 11: A SET:TRAP input message has been entered and processed successfully. When it is time to start the trap, an attempt is made to start the trap on all the link nodes specified in the SET:TRAP input message. MON\_TRAP expects acknowledgements from all the link nodes within certain time interval. MON\_TRAP will remove those link nodes which give no or negative acknowledgements from the list of the link nodes belonging to this trap. The trap should have started on the remaining nodes. If all nodes give no or negative acknowledgements, MON\_TRAP will abort the trap. This format gives a summary of the condition when MON\_TRAP does not receive any acknowledgement from one or more of the given link nodes.

Format 12: Any trap on a node will be disabled when the node has gone from IS to OOS. This format results when MON\_TRAP finds that one or more link nodes, which are supposed to have trap on, have gone from IS to OOS at least once during the last one-minute interval.

Format 13: This format results when one of the link nodes belonging to a trap has been removed from the trap due to the reason displayed.

Format 14: This format results when a link node with trap on has sent an abort trap message along with a reason to the 3B. MON\_TRAP then removes the link node from the list of link nodes belonging to the trap. The reason is printed.

Format 15: This format results when an OP:TRAP input message with ID given is being processed, and MON\_TRAP finds that all the trapped results belonging to the specified trap have been overwritten. The number of trapped messages lost, which belonged to this trap, is printed.

Format 16: This format results when an OP:TRAP input message with ID given is being processed, and MON\_TRAP finds that some of the trapped results belonging to the specified trap have been overwritten. The number of trapped messages lost, which belonged to this trap, is printed. The remaining trapped messages should have been displayed.

Format 17: This format results when all the message trap incore buffers become unavailable at the 3B. These incore buffers are used for collecting trapped results before the results are written to the disk file for long term storage. This condition may be due to a high volume of trapped results, not expected to be handled by this tool, being sent to the 3B in a short interval. Hence, MON\_TRAP aborts all the traps to stop the excessive incoming traffic.

Format 18: This format results when the overwrite option has been disabled and the disk file has been filled with trapped results.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 19: This format is to report the percentage usage of the disk file.

Format 20: This format results when an application of the Message Trap feature has tuned one of the application tunable parameters to a value larger than the internal limit allowed by the feature. The value of the parameter is then set to the value of the internal limit which is displayed in this format.

Format 21: This format results when an error occurs in the real time display of trapped results. Part of the results to be displayed is lost.

Format 22: This format results when an unexpected RTR signal is received by MON\_TRAP. Information on the RTR signals can be obtained from the RTR documents.

Format 23: This format results when MON\_TRAP aborts. Other message format may precede this format to explain the reason why MON\_TRAP has aborted.

Format 24: This format results when MON\_TRAP cannot send any RTR message to EBD due to the unavailability of RTR buffers. Since EBD is responsible for printing out the trap information and results, no output is expected from EBD because MON\_TRAP cannot instruct EBD regarding the output of trap information and results. The errno information can be obtained from the RTR documents.

Format 25: This format results when the following scenario occurs. Before MON\_TRAP sends an RTR message to EBD, it checks if EBD exists. If yes, MON\_TRAP will build the RTR message and send it out. EBD is then killed for some reason during this time frame when MON\_TRAP is building the RTR message.

Format 26: This format results when MON\_TRAP cannot execute the EBD object module using the RTR system call "execl()".

Format 27: This format results when MON\_TRAP cannot find any or enough contiguous disk space in the system. Normally, MON\_TRAP uses the RTR system call "falloc()" to create the disk file, which contains the contiguous disk space, at the appropriate directory. Message Trap cannot carry out its normal trapping activities without enough contiguous disk space.

Format 28: This format results when a System 7 link node performs an automatic data dump, the MON\_TRAP process receives this data and writes it to the file /etc/log/LNDMP\_DATA.

### 3. VARIABLE FIELD DEFINITIONS

a                    ALL LN 00S  
                     ALL LN OCCUPIED  
                     ALL LN 00S OR OCCUPIED  
                     TOO MANY ATTRIBUTES

SEE PROPRIETARY NOTICE ON COVER PAGE

- TRAPPING ON MORE THAN xx LINKS—Where xx = Maximum number of links allowed to be trapped on at any time.
- b Trap Identification number.
- c Ring node address.
- d Reason used in abort trap message or negative acknowledgement message from link node:
- 1 — A different trap already running.
  - 2 — Same trap already running.
  - 3 — Ring write for a response failed.
  - 4 — Ring write for a report message failed.
  - 5 — Command's trap id not matching node's.
  - 6 — Node state is same as the cmd received.
  - 7 — Undefined command.
  - 8 — Msg trap buffer unavailable.
  - 9 — XMIT mbox level 1 or higher congestion.
  - 10 — Real-time level 1 or higher overload.
  - 11 — IMS RRB level 1 or higher congestion.
  - 12 — RPC level 1 or higher congestion.
  - 13 — Trap buffer at node congested.
  - 14 — Received a 3B returned message.
  - 15 — Received a source-matched message.
  - 16 — RCV mbox level 1 or higher congestion.
- e Number of link nodes.
- f Termination Reason (trap state = TRM | ABT | CMP):
- 0 — Unspecified.
  - 1 — The trap has gone to completion gracefully (due to message count).
  - 2 — The trap has gone to completion gracefully (due to duration).
  - 3 — Craft initiated stop:trap.
  - 4 — Inhibited for too long; abort trap.
  - 5 — Resource problem at the 3B computer.
  - 6 — Frequency of disk write at the 3B computer exceeds threshold.
  - 7 — Disk space exhausted in "no overwrite" mode.
  - 8 — MTRP incore buffers unavailable during disk\_write.
  - 9 — CNI level 1 initialization has occurred.
  - 10 — Trap aborted at all concerned link node(s), due to resource or congestion problem(s) at link node(s).
  - 11 — All concerned link nodes are OOS.
  - 12 — All concerned link nodes are either OOS or have aborted the trap.
  - 13 — Problem occurred during status check or audit.

SEE PROPRIETARY NOTICE ON COVER PAGE

- g Reason for removal of a link node from trap:
- 1 — Link node has been through a state transition.
  - 2 — Received an abort\_trap message from link node.
  - 3 — Received a returned message destined to link node.
  - 4 — Received an src-matched message destined to link node.
  - 5 — Link node occupied by other trap.
  - 6 — Status check indicates link node has aborted trap.
  - 7 — Have not received ack (of start\_trap) from link node.
  - 8 — Received a negative ack (of start\_trap) from link node.
- h Trap ID recorded at 3B.
- i Trap ID recorded at node.
- j MTRP: TRAP ABORTED DUE TO NO ACK; ID = a  
MTRP: TRAP SET ON REMAINING c NODE(S); ID = a
- k Trap state:
- 0 FRE — Trap entry is free (Not a Trap State).
  - 1 ACT — Trap is active.
  - 2 PND — Trap has never been started; pending to be activated.
  - 3 INH — Trap has been started; is inhibited.
  - 4 CMP — Trap has gone to completion as specified in message count/duration.
  - 5 ABT — Trap has been aborted prior to the specified completion criteria due to congestion/resource/node\_removal problems at link nodes or resource problem at 3B.
  - 6 TRM — Trap has been explicitly terminated prior to the specified completion criteria by a STOP:TRAP input message.
- l Number of messages lost:
- ALL — Number of messages lost = number of messages collected.
- SOME — Number of messages lost = number of messages collected minus number of messages printed.
- m Percentage use of disk space.
- n OVERWRITE DISABLED — Disk file overwrite is disabled.  
OVERWRITE ENABLED — Disk file overwrite is enabled.
- o MAX MCNT — Maximum message count.  
MAX DUR (MINUTES) — Maximum duration.  
MAX MGSZ (BYTES) — Maximum message size.
- p RTR signal (see RTR documents).
- q RTR error number given when an RTR system call fails (see RTR documents).
- r Path and file name of the Message Trap contiguous disk file.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

Format 1: If the reason printed is:

**TRAP NEEDS TOO MANY ATTRIBUTES** Input parameters are transformed into trap attributes which will be used by the link nodes to perform message matching. Realtime concerns at link nodes impose a limit on the number of attributes that can be used for trapping. The number of attributes generated from the parameters given in the SET:TRAP input message exceeds that limit.

Reduce the number of input parameters given in the SET:TRAP input message.

**TRAPPING ON MORE THAN xx LINKS** — Maximum number of links that can have trap on at any time has been reached (including this trap).

Attempt any of the following:

1. Retry SET:TRAP input message with fewer links; or
2. Use STOP:TRAP input message to stop any unwanted active or inhibited trap.

**ALL LN OOS** — All the link nodes of the links specified in the SET:TRAP input message are out of service.

**ALL LN OCCUPIED** — All the links specified in the SET:TRAP input message are occupied by other traps.

**ALL LN OOS OR OCCUPIED** — Message is self-explanatory. Refer to previous two items.

Format 2,8-11,13,14,18: Message is self-explanatory.

Formats 3-7,12,15-17,19,20,23,25: None.

Format 21: The condition may be due to a relatively high rate of incoming trapped results for this trap which has real time display on. The message trap real time display print buffers may become unavailable or EBD is not able to output the trapped results as fast as the trapped results are given to it. May consider turning off the real time display mode.

Format 22: Refer to RTR documents for the meaning of the signal.

Format 24: Refer to RTR documents for the meaning of the error number.

Format 26: Check if the object module of the process EBD is in the correct directory; if yes, check if it is executable.

Format 27: Check if the appropriate directory has been created for the disk file that is supposed to contain the contiguous disk space; and check if enough contiguous disk space has been partitioned (or allocated) for the file system related to the directory. If there is no directory but there is enough contiguous disk space in the file system, create the directory and kill the MON\_TRAP process which will then be re-created by the CNIINIT process. If there is not enough contiguous disk space in the file system, partition enough contiguous disk space (may need to reboot the system).

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT MOP CANNOT UNMOUNT DEVICE a ERROR = b

## 2. REASON FOR OUTPUT

To report that the process Mount Off-Line Partition (MOP) is unable to unmount the off-line partition mounted as device listed due to error given.

## 3. VARIABLE FIELD DEFINITIONS

a                      Name of device.  
b                      Error code:  
                        See System Error Codes Output Appendix, APP:SYSERR.

## 4. ACTION TO BE TAKEN

If MOP is unable to unmount device listed because a file on the device is open (busy), close the file and MOP will unmount device listed approximately two minutes after most recent REPT time.

If MOP is unable to unmount the device due to an input/output error, kill the current MOP process before executing a second MOP message.

## 1. FORMAT

REPT MRVR  
a b  
c

## 2. REASON FOR OUTPUT

This output is in response to a receipt of an unexpected MRVR message. The output will be directed to the standard output associated with the initiator of the test, and also to the maintenance class. If they are the same device, only one printout will occur.

## 3. VARIABLE FIELD DEFINITIONS

- a                    One of the following text phrases based on the information received in the MRVR message.
- STPS   CROSSED  
LOOP  
EXCESSIVE LENGTH ROUTE  
UNKNOWN TERMINATOR POINT CODE  
INACCESSIBLE SIGNALING POINT  
TIMER EXPIRED  
UNKNOWN INITIATOR POINT CODE  
TEST CANNOT BE RUN DUE TO LOCAL CONDITIONS  
WRONG SIGNALING POINT  
ASYMMETRICAL ROUTE  
SUCCESS TO GATEWAY  
UNKNOWN ERROR CODE
- b                    Error number associated with error described in a. Note that if a is STPS CROSSED, this item will not be included in the output message.
- 1 — Detected loop.  
2 — Excessive length route.  
3 — Unknown resource instance.  
4 — Route inaccessible.  
5 — Processing failure.  
6 — Unknown initiating SP.  
7 — Timer expired.  
8 — Wrong signaling point.  
9 — Asymmetrical route.  
10 — Success to gateway.

## 1. FORMAT

This message has two output formats:

- [1] REPT MSDC FLT  
EFLAGS=a, FLTCODE=b
- [2] REPT MSDC FLT  
EFLAGS=a, FLTCODE=b, PA=c  
R0=d, R7=e, R8=f

## 2. REASON FOR OUTPUT

The IMS measurement process (msdc.p) has encountered a hardware or software fault.

## 3. VARIABLE FIELD DEFINITIONS

- a Hexadecimal number which is the sum of the codes for all UNIX® RTR events outstanding for the IMS measurement process. (These are defined in UNIX® RTR header file evflag.h.)
- b The UNIX® RTR fault code.
- c If this is present, then the IMS measurement process was in execution at this virtual address when the fault was encountered.
- d Contents of 3B CU register r0.
- e Contents of 3B CU register r7.
- f Contents of 3B CU register r8.

## 4. ACTION TO BE TAKEN

Analyze the fault code (See Output Appendix APP: FAULT-CODE).

If the fault is not attributed to a hardware problem, seek technical assistance.

## 5. REFERENCES

## 2. REASON FOR OUTPUT

To report a Magnetic Tape (MT) related software or hardware error.

Formats 1 and 2 are output exclusively by the Input/Output Processor (IOP) tape device driver. Format 3 is common and may be output by both the drivers. Formats 4 through 15 are output exclusively by the Small Computer System Interface (SCSI) Disk File Controller (DFC) driver.

Format 15 provides SCSI Job Response (SJR) information when an explicit SCSI command, built by the DFC. driver, fails. The SJR data is necessary to determine the exact cause of the error condition.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                                                                                                 |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | Member number.                                                                                                                                                  |
| b | Identifies point within the Input/Output Driver (IODRV) where a software or hardware error was detected, in hexadecimal. See IOP Output Appendix F, APP: IOP-F. |
| c | Hardware error type, in hexadecimal. See IOP Output Appendix A, APP: IOP-A.                                                                                     |
| d | First word of an unidentifiable completion report.                                                                                                              |
| e | Second word of an unidentifiable completion report.                                                                                                             |
| f | Command completion code. See Tables 1 and 2 in DFC Output Appendix B, APP: DFC-B.                                                                               |
| g | Number of blocks read or written.                                                                                                                               |
| h | Device ID number.                                                                                                                                               |
| i | Special completion code; valid only when the DMA job number is 00. See Table 3 in DFC Output Appendix B, APP: DFC-B.                                            |
| j | DMA job number (job ID).                                                                                                                                        |
| k | Device status, in hexadecimal. See DFC Output Appendix C, APP: DFC-C.                                                                                           |
| l | Channel status, in hexadecimal. See DFC Output Appendix D, APP: DFC-D.                                                                                          |
| m | Bus selector status, in hexadecimal. See DFC Output Appendix E, APP: DFC-E.                                                                                     |
| n | Bus Interface Controller (BIC) status, in hexadecimal. See DFC Output Appendix F, APP: DFC-F.                                                                   |
| o | BIC status, in hexadecimal. See DFC Output Appendix F, APP: DFC-F.                                                                                              |
| p | Mask.                                                                                                                                                           |
| q | Expected value of BIC status after being masked with mask given.                                                                                                |
| r | Supplemental data for the previous REPT-DKDRV message.                                                                                                          |
| s | Fault code, in hexadecimal. See DFC Output Appendix I, APP: DFC-I.                                                                                              |
| t | Autonomous response special completion code. See Tables 1 and 2 in DFC Output Appendix B, APP: DFC-B.                                                           |
| u | Provides the reason for the autonomous response. See Table 3 in DFC Output Appendix B, APP: DFC-B.                                                              |
| v | The SCSI Host Adapter (HA) shadow register status, in hexadecimal. See DFC Output Appendix P, APP: DFC-P.                                                       |
| w | Information code. See DFC Output Appendix A, APP: DFC-A.                                                                                                        |

SEE PROPRIETARY NOTICE ON COVER PAGE

- x Command completion word. The command completion word is eight hexadecimal digits of the form AAAABBCC.
- AAAA = SCSI Job Block (SJB) completion code. See "Job completion code" under "General Job Information" in DFC Output Appendix K, APP:DFC-K.
- BB = Status byte. See "Target SCSI status byte" under "SCSI Command Information" in DFC Output Appendix K, APP:DFC-K.
- CC = Fill. Not used.
- y First word of Extended Sense Data (ESD). See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 0 of ESD.
- BB = Byte 1 of ESD.
- CC = Byte 2 of ESD.
- DD = Byte 3 of ESD.
- z Second word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 4 of ESD.
- BB = Byte 5 of ESD.
- CC = Byte 6 of ESD.
- DD = Byte 7 of ESD.
- a1 Third word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 8 of ESD.
- BB = Byte 9 of ESD.
- CC = Byte 10 of ESD.
- DD = Byte 11 of ESD.
- b1 Fourth word of ESD. See DFC Output Appendix J, APP:DFC-J. This word is structured as eight hexadecimal digits of the form AABBCDD.
- AA = Byte 12 of ESD.
- BB = Byte 13 of ESD.
- CC = Byte 14 of ESD.
- DD = Byte 15 of ESD.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

These error messages indicate error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

If Format 15 prints, the SCSI drive encountered an internal drive error. Retain a copy of the error data, then contact the next level of technical support to aid in determining the cause of the error condition.

## 1. FORMAT

- [1] REPT MTC a{ERROR b[COMPL CODE c]|  
UNIDENTIFIED RESPONSE WD1=d WD2=e}
- [2] REPT MTC a CODE VERSION X'f

## 2. REASON FOR OUTPUT

Format 1 reports a Magnetic Tape Controller (MTC) related software or hardware error.

Format 2 is output during the restoral of the unit.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies point within the Input/Output Driver (IODRV) where a software or hardware error was detected, in hexadecimal notation. See IOP Output Appendix F, APP: IOP-F.
- c Hardware error type, in hexadecimal notation. See IOP Output Appendix A, APP: IOP-A.
- d First word of an unidentifiable completion report.
- e Second word of an unidentifiable completion report.
- f Peripheral controller pump code version.

## 4. ACTION TO BE TAKEN

These error messages indicate error conditions that could cause the removal of a unit. Any removed unit must be repaired and restored to service. No action is necessary for the message in Format 2 unless the controller and /or its subdevices are not acting normally or could not be restored. Contact the service organization with the code version which was used.

ID ..... REPT:MTTY  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

### 1. FORMAT

- [1] REPT MTTY a {ERROR b [c] [COMPLETED CODE d] |  
UNIDENTIFIED RESPONSE WD1=e WD2=f}
- [2] REPT MTTY a STARTED
- [3] REPT MTTY a STOPPED

### 2. REASON FOR OUTPUT

Format 1 reports a Maintenance Teletypewriter (MTTY) related software or hardware error.

Format 2 reports that the MTTY has changed state from STBY to ACT. An MTTY will change to ACT state when Data Terminal Ready (DTR) is ON.

Format 3 reports that the MTTY has changed state from ACT to STBY. An MTTY will change to STBY state when DTR is OFF.

### 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies, in hexadecimal notation, the point within the Input/Output Driver (IODRV) where a software or hardware error was detected. See IOP Output Appendix F, APP:IOP-F.
- c Character string giving more information about the error identified. Refer to IOP Output Appendix F, APP:IOP-F for additional explanation.
- d Hardware error type, in hexadecimal notation. See IOP Output Appendix A, APP:IOP-A.
- e First word of an unidentified completion report.
- f Second word of an unidentified completion report.

### 4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit must be repaired and then restored to service.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 2 and 3 are informational messages and indicate that the MTTY has changed states. These messages will be output when the currently active MTTY changes state to STBY, and the currently STBY MTTY changes state to ACT. An active MTTY will change state to STBY when powered off, and a standby MTTY will change state to ACT when powered up. No action is necessary.

PHYSICAL MEMORY ADDRESS: ooooooooo  
[CHANNEL DATA REGISTER: pppppppp]  
REAL TIME CLOCK: qq qq qq qq

## 2. REASON FOR OUTPUT

A non-correctable parity error has occurred during a Direct Memory Access (DMA) read of a memory location on the currently running Control Unit (CU).

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                       |
|---|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | The sequence number, in hexadecimal, of the report.                                                                                                   |
| b | Active CU number.                                                                                                                                     |
| c | Unit name.                                                                                                                                            |
| d | Member number.                                                                                                                                        |
| e | Time in form mm/dd/yy hh:mm:ss.                                                                                                                       |
| f | Input/output address, in hexadecimal, of the DMA Controller (DMAC) encountering the fault.                                                            |
| g | The contents, in hexadecimal, of the DMA status register. See the <i>System Maintenance Manual</i> , Appendixes C and D.                              |
| h | If bit 27 of the main store controller 0 Trapped Address Register (TAR0) is set, TAR0 contains the address, in hexadecimal, where the fault occurred. |

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                                              |
|---|----------------------------------------------------------------------------------------------------------------------------------------------|
| i | The contents, in hexadecimal, of the main store controller 0 Error Register 1 (ER01). See the <i>System Maintenance Manual</i> , Appendix F. |
| j | The contents, in hexadecimal, of the main store controller 0 Error Register 2 (ER02). See the <i>System Maintenance Manual</i> , Appendix F. |
| k | The contents, in hexadecimal, of the main store controller 1 Trapped Address Register (TAR1).                                                |
| l | The contents, in hexadecimal, of the main store controller 1 Error Register 1 (ER11). See the <i>System Maintenance Manual</i> , Appendix F. |
| m | The contents, in hexadecimal, of the main store controller 1 Error Register 2 (ER12). See the <i>System Maintenance Manual</i> , Appendix F. |
| n | Error data (in hexadecimal).                                                                                                                 |
| o | Physical memory address (in hexadecimal).                                                                                                    |
| p | For Model 1 the contents, in hexadecimal, of the faulted channels data register. For Model 2 this line is blank.                             |
| q | Value, in milliseconds and hexadecimal, of the Real Time Clock (RTC) at the time of the error interrupt.                                     |

#### 4. ACTION TO BE TAKEN

If the processors switched as a result of the error, run diagnostics on the processor encountering the fault.

## 1. FORMAT

REPT NM CNI RING CONFIG DATA COMPL CODE a

## 2. REASON FOR OUTPUT

This output message provides the completion code for writing CNI ring configuration information to the network management 1B disk structure NM4DCNIDD. The 1B disk attributes of the structure are found in 1B disk only data pident TRAF3BDT (SET5). Process (/usr/bin/nmconfig) accesses pident TRAF3BDT using 1B vector table disk address 06200+04566. Vector index 04566 has been assigned to TRAF3BSS.

The process (/usr/bin/nmconfig) is scheduled to run by parent "cron" every day at time 0103 in the morning.

## 3. VARIABLE FIELD DEFINITIONS

a                      Completion code defined as follows:

- 0     — Success.
- 1xx   — File /dev/1astat open failed.  
      xx = System error code.
- 2xx   — File /dev/1astat read failed.  
      xx = System error code.
- 3xx   — File /dev/1afile0 or /dev/1afile1 open failed.  
      xx = System error code.
- 4xx   — 1B file vector table read failed.  
      xx = System error code.
- 5xx   — Pident TRAF3BDT read failed (062000+04566 base 8).  
      xx = System error code.
- 600   — Pident TRAF3BDT has an incorrect magic number.
- 7xx   — Pident TRAF3BDT set header read failed.  
      xx = System error code.
- 800   — Failed to find SET5 in pident TRAF3BDT.
- 9xx   — Failed to read SET5 information from pident TRAF3BDT.  
      xx = System error code.
- 10xx — Failed to write NM ring configuration data to 1B disk  
      structure NM4DCNIDD.  
      xx = System error code.

## 4. ACTION TO BE TAKEN

If the completion code is nonzero, seek technical assistance.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT OFFLINE BOOT IN PROGRESS a
- [2] REPT OFFLINE BOOT {ABORTED | STOPPED | TERMINATED}

## 2. REASON FOR OUTPUT

These messages are output to report information about the execution of the offline boot feature.

Format 1 is printed every 5 minutes, after the off-line side has booted successfully, to indicate that the system is still in offline boot and therefore, is still logically split.

Format 2 is printed after the off-line side has booted successfully and offline boot is being stopped. Whether devices moved to the off-line side are restored or not depends on the abort type.

## 3. VARIABLE FIELD DEFINITIONS

- a Offline side boot completion status. If this part of the message is not printed, a side-switch was performed and the initial offline side boot completion status is no longer valid. Otherwise, the following text will be printed, respectively, when the offline side boot completes without errors and with non-fatal errors:
- OFFLINE SIDE BOOT COMPLETED
  - OFFLINE SIDE BOOT COMPLETED WITH ERRORS
- ABORTED Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.
- STOPPED Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
- TERMINATED UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.

## 4. ACTION TO BE TAKEN

For Format 1, in the case where non-fatal errors occurred, the ROP should be examined for additional messages associated with the offline boot. Any action to be taken is based on these messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

## 2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Message type:
- ABORTED            — Application request to stop the offline boot procedure; devices moved to the off-line side will be restored.
  - COMPLETED      — Indicates off-line side boot has completed.
  - INFO                — For information only.
  - STOPPED            — Manual request to stop the offline boot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
  - TERMINATED        — UNIX® RTR software-initiated termination of the offline boot procedure; devices moved to the off-line side will not be restored.

- b                      Text line:
- ABORT DENIED DURING SWITCH  
Application-initiated aborts are ignored while SW:OFLBOOT is running.
  - ADP IS NOT RUNNING, CANNOT RESTORE g h  
Automatic Diagnostic Process (ADP) is not running, so the automatic restore of the specified unit will not be done.
  - AIM PRINTING OF PRE-CHECKS OR POST-CHECKS TIMED OUT  
Offline boot did not receive results of activities before the timers expired.
  - AIM REPORTED FAILURE TO REDUPLEX  
AIM reported failure to put the system back to its state previous to the off-line boot.
  - AIM REPORTED FAILURE TO SPLIT  
AIM reported failure to split in preparation for booting off-line.
  - AIM REPORTED FAILURE TO TURN CALL PROCESSING OFF  
AIM reported call origination could not be turned off in preparation for side switching. If retrofit was not specified, SW:OFLBOOT will fail.
  - AIM REPORTED FAILURE TO TURN CALL PROCESSING ON  
AIM reported call origination could not be turned on.
  - AIM REPORTED PRE-CONFIGURATION FAILURES  
AIM reported pre-configuration errors in preparation for booting off-line.

SEE PROPRIETARY NOTICE ON COVER PAGE

CANNOT ACCESS A DIAGNOSTIC/MAINTENANCE SPECIAL  
DEVICE FILE

There were problems in obtaining a special device file; therefore, a DFC cannot be removed. Offline boot will be terminated.

CANNOT ACCESS ECD

Device information cannot be accessed from the RC/V ECD while booting off-line or side switching. Depending on the function name printed, there are different consequences:

CHECK\_OOS — Cannot get a UCB record to verify that the unit has indeed been removed as part of RTR offline boot pre-configuration. Offline boot will be automatically terminated.

CHG\_DFC — Cannot get a DFC UCB or a DFC sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The DFC or its sub-unit will remain in the GROW state.

CHG\_IOPS — Cannot get an IOP UCB or an IOP sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The IOP or its sub-unit will remain in the GROW state.

DEGROW\_DFC — Cannot get a DFC UCB record before unequipping it. The DFC will remain in the OOS state. Offline boot will be automatically terminated.

DEGROW\_IOP — Cannot get an IOP UCB record before unequipping it. The IOP will remain in the OOS state. Offline boot will be automatically terminated.

EQUIP\_CU — Cannot get CU UCB when equipping the CU community as part of stopping the offline boot. The complete CU community or some of its sub-units will remain in the UNEQIP state.

GROW\_DFC — Cannot get a DFC UCB or a DFC sub-unit UCB record before equipping it as part of stopping the offline boot. The DFC or its sub-unit will remain in the UNEQIP state.

GROW\_IOPS — Cannot get an IOP UCB or an IOP sub-unit UCB record before moving it to the OOS state as part of stopping the offline boot. The IOP or its sub-unit will remain in the UNEQIP state.

OLBCONTROL — Cannot get CU UCB record before removing the CU community. Offline boot will be automatically terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

- RMV\_DFC — Cannot get a DFC UCB record before removing it. Offline boot will be automatically terminated.
- RMV\_IOPS — Cannot get an IOP UCB record before removing it. If more than one IOP was specified in the EXC\_OFLBOOT command line, then one or more IOPs may have been moved to the OOS state and remain that way even though offline boot has been automatically terminated. This is because one or more messages to remove IOP may have already been dispatched to the IODRV before this failure occurred.
- RSTFCN — Cannot get a CU UCB record before sending ADP a message to restore the CU as part of stopping offline boot. The CU will remain in the OOS state.
- RST\_DFC — Cannot get a DFC UCB record before sending ADP a message to restore the DFC as part of stopping offline boot. The DFC will remain in the OOS state.
- RST\_IOPS — Cannot get an IOP UCB record before sending ADP a message to restore it as part of stopping offline boot. If more than one IOP was specified in the EXC:OFLBOOT command line, then one or more IOPs may have been restored despite this failure. This is because one or more messages to ADP may have already been dispatched.
- TIM\_UNIT — Cannot get an IOP UCB record or an IOP sub-unit UCB record to report that the IODRV timed out when growing this device. The unknown device will remain in the UNEQIP or GROW state.
- UNRESERVE — Cannot get a UCB record while stopping offline boot. Some units' records may remain reserved.
- CANNOT CLOSE SPECIAL DEVICE FILE**  
DKDRV could not close a special device file. Consequently, its internal tables are corrupt and indicate a DFC is undergoing maintenance forever.
- CANNOT COPY MEMORY AREA FROM OFFLINE CU TO ONLINE CU**  
Information cannot be transferred either from the on-line CU to the off-line side or vice versa.

SEE PROPRIETARY NOTICE ON COVER PAGE

**CANNOT COPY MEMORY AREA FROM ONLINE CU TO OFFLINE CU**  
Information cannot be transferred either from the on-line CU to the off-line side or vice versa.

**CANNOT CREATE VFYDISKECD PROCESS**  
The process that checks to see if a disk ECD RC/V session is in progress cannot be created.

**CANNOT DETERMINE ACT IOP FOR MTTY OR ROP**  
Either the system is missing its MTTY or ROP or the RC/V ECD is corrupt. Offline boot cannot be guaranteed under these conditions.

**CANNOT DETERMINE IF OFFLINE SIDE IS RUNNING**  
The on-line CU cannot determine if the off-line CU is running or not. Before the on-line CU tries to access the off-line CU for a memory copy, it needs to know whether the off-line CU is running. This is done by reading the off-line CU SSR through a series of MCH instructions. These instructions failed, which indicates problems with the MCH. This condition sometimes results in automatic termination of offline boot.

**CANNOT GROW g h**  
Prints if a device cannot be grown.

**CANNOT OUTPUT POST MORTEM, REASON n**  
EIH could not output the post-mortem for reason listed.

**CANNOT PORT SWITCH MTTY**  
A message could not be sent to the IODRV to port switch an MTTY or ROP device.

**CANNOT PORT SWITCH MTTY OR ROP**  
The IODRV did not respond to the port switch message in the allotted time frame. When the timer expired, EIH checked the MTTY and ROP devices and found that they had not been port switched.

**CANNOT PORT SWITCH ROP**  
A message could not be sent to the IODRV to port switch an MTTY or ROP device.

**CANNOT READ OFFLINE CU SSR**  
The on-line CU cannot determine if the off-line CU is running. Periodically, the on-line CU checks the off-line CU's SSR to know whether the off-line CU is running or not. This is done by reading the off-line CU SSR through a series of MCH instructions. The instructions failed which indicates problems with the MCH. This condition will result in the automatic termination of offline boot.

SEE PROPRIETARY NOTICE ON COVER PAGE

**CANNOT RECONFIGURE CU COMMUNITY**

Devices could not be reconfigured due to RC/V ECD access or update failures. Another possibility is that the device was properly reconfigured, but a message could not be sent to RTS to update the display pages information.

**CANNOT RELEASE AN MDCT RECORD**

While trying to release an MDCT RC/V ECD record of type diagnostic that is associated with the disk community, the RC/V ECD could not be accessed or updated.

**CANNOT REMOVE DFC**

Units could not be removed in preparation for booting off-line.

**CANNOT REMOVE IOP**

Units could not be removed in preparation for booting off-line.

**CANNOT RESET SANITY TIMERS**

Sanity timers cannot be reset or cleared.

**CANNOT RESTORE TO ORIGINAL STATE g h**

Devices could not be reconfigured due to RC/V ECD access or update failures. Another possibility is that the device was properly reconfigured, but a message could not be sent to RTS to update the display pages information.

**CANNOT RESTORE g h**

A message could not be sent to ADP to unconditionally restore a CU, DFC, or IOP community.

**CANNOT SEND DEGROWTH MESSAGE TO IODRV**

Degrowth requests cannot be sent to IODRV in preparation for booting off-line.

**CANNOT SEND GROWTH MESSAGE TO DKDRV**

Growth requests cannot be sent to DKDRV in order to reduplex the system.

**CANNOT SEND GROWTH MESSAGE TO IODRV**

Growth requests cannot be sent to IODRV in order to reduplex the system.

**CANNOT SEND IOCLOSE MESSAGE TO DKDRV**

A message cannot be sent to DKDRV requesting it to close a special device file. If the message prints twice, it means DKDRV will not have a chance to close a special device file. Consequently, its internal tables are corrupt and indicate a DFC is undergoing maintenance forever.

**CANNOT SEND IOOPEN MESSAGE TO DKDRV**

Message cannot be sent to DKDRV. Usually the reason is that a message buffer cannot be allocated for the message.

**CANNOT SEND MESSAGE TO PMPRC**

Message cannot be sent to PMPRC. Usually the reason is that a message buffer cannot be allocated for the message.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CANNOT SEND MESSAGE TO USER PROCESS, PID i  
Message cannot be sent to a user process identified by its process ID. Usually the reason is that a message buffer cannot be allocated for the message.
- CANNOT SEND OLBCPOFF MESSAGE TO AIM ERROR 1  
Message requesting AIM to turn call origination off failed. Reason for the failure is given in variable listed.
- CANNOT SEND OLBCPON MESSAGE TO AIM ERROR 1  
EIH could not send a message to AIM of activity OLBCPON. This message is serious; the system does not have call origination. Reason for the failure is given in variable listed.
- CANNOT SEND OLBDUPLEX MESSAGE TO AIM ERROR 1  
Message requesting AIM to reduplex failed. Reason for the failure is given in variable listed.
- CANNOT SEND OLBPOSTSW MESSAGE TO AIM ERROR 1  
Message requesting AIM to take post-switch actions failed. Reason for the failure is given in variable listed.
- CANNOT SEND OLBPRECFG MESSAGE TO AIM ERROR 1  
Message requesting AIM to pre-configure for an offline boot failed. Reason for the failure is given in variable listed.
- CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR 1  
Message requesting AIM to perform offline boot pre-checks failed. Reason for the failure is given in variable listed.
- CANNOT SEND OLBPRINT MESSAGE TO AIM ERROR 1  
Message requesting AIM to print the results of a previous check failed. Reason for the failure is given in variable listed.
- CANNOT SEND OLBSPLIT MESSAGE TO AIM ERROR 1  
Message requesting AIM to unequip application hardware RC/V ECD UCBs failed. Reason for the failure is given in variable listed.
- CANNOT SEND REC\_UPDATE MESSAGE TO DKDRV  
Message cannot be sent to DKDRV to update its disk display pages. Usually the reason is that a message buffer cannot be allocated for the message.
- CANNOT SEND UNTRMV MESSAGE TO DKDRV  
DFC remove request cannot be sent to DKDRV in preparation for booting off-line.
- CANNOT SEND UNTRMV MESSAGE TO IODRV  
IOP remove request cannot be sent to IODRV in preparation for booting off-line.

SEE PROPRIETARY NOTICE ON COVER PAGE

CANNOT SEND UNTRST MESSAGE TO IODRV

EIH could not send a message during a side switch to restore an MTTY, ROP, or SCC device.

CANNOT UNEQIP DEVICES

CU community devices cannot be unequipped.

CANNOT UNEQIP g h

DFC and IOP devices and their sub-units cannot be unequipped.

CANNOT UPDATE ECD

The RC/V ECD cannot be updated. The reason is dependent on the function name printed:

DFS — Could not reserve a unit's UCB record as part of EXC:OFLBOOT pre-checks.

UNRESERVE — Could not unreserve a UCB record while stopping offline boot. Some units' UCB records may remain reserved.

CC\_OTH A IN THE ON-LINE

A level 1 interrupt has occurred. The other CC hardware has reported a store hardware fault error (ER12). See the *System Maintenance Manual* for more information on ER12. Offline boot will be terminated because of faulty hardware.

CC\_OTH C IN THE ON-LINE

A level 1 interrupt has occurred. The other CC hardware has reported a read parity fault hardware error (ER14). See the *System Maintenance Manual* for more information on ER14. Offline boot will be terminated because of faulty hardware.

CC\_OTH D IN THE ON-LINE

A level 1 interrupt has occurred. The other CC hardware has reported a refresh parity fault hardware error (ER13). See the *System Maintenance Manual* for more information on ER13. Offline boot will be terminated because of faulty hardware.

CC\_OTH T0 IN THE ON-LINE

A level 1 interrupt has occurred. The other CC hardware has reported a store time-out hardware error (ER15). See the *System Maintenance Manual* for more information on ER15. Offline boot will be terminated because of faulty hardware.

CHANGED DISK FORCES

The DFC that is now forced on-line is not the same DFC that was forced on-line when the offline boot procedure was started. Offline boot will be terminated.

CORRUPT TIMER SLOT

EIH found that the timer slot did not correspond to the ongoing action. Because EIH cannot use the corrupt time value from the slot, it uses a best guess of the time value instead.

SEE PROPRIETARY NOTICE ON COVER PAGE

**CORRUPT VALUE FOR ABORT TIMER**

The offline boot stop sequence can be started when EIH is performing an action that:

- Does not need a timer to monitor it (NOTIMER).
- Needs a timer to monitor it, but the timer has not been started (NEEDTIMER).
- Needs a timer to monitor it and the timer has been started (RUNNING).

This information (NOTIMER, NEEDTIMER, or RUNNING) has been found to be inconsistent or corrupted in comparison with the ongoing action. EIH will assume the worst case (a timer is RUNNING) and continue with the stop sequence. This assumption may result in this text line printing several times.

**COULD NOT PORT SWITCH**

The IODRV returned a port switch request message with a failure code.

**COULD NOT TELL SIM TO BLOCK ECD 1 AUDITS**

The EIH process could not tell the SIM process to block the ECD 1 audits.

**COULD NOT TELL SIM TO BLOCK ECD 3 AUDITS**

The EIH process could not tell the SIM process to block the ECD 3 audits.

**COULD NOT TELL SIM TO BLOCK ECD 2 (APPECD) AUDITS**

The EIH process could not tell the SIM process to block the ECD 2 (appecd) audits.

**COULD NOT TELL SIM TO BLOCK ECD 2 (ECD) AUDITS**

The EIH process could not tell the SIM process to block the ECD 2 (ecd) audits.

**COULD NOT TELL SIM TO UNBLOCK ECD 1 AUDITS**

The EIH process could not tell the SIM process to unblock the ECD 1 audits.

**COULD NOT TELL SIM TO UNBLOCK ECD 3 AUDITS**

The EIH process could not tell the SIM process to unblock the ECD 3 audits.

**COULD NOT TELL SIM TO UNBLOCK ECD 2 (APPECD) AUDITS**

The EIH process could not tell the SIM process to unblock the ECD 2 (appecd) audits.

**COULD NOT TELL SIM TO UNBLOCK ECD 2 (ECD) AUDITS**

The EIH process could not tell the SIM process to unblock the ECD 2 (ecd) audits.

SEE PROPRIETARY NOTICE ON COVER PAGE

**DFC PRECHECKS FAILED**

DFC-related checks failed. Offline boot will be terminated.

**DISK RC/V ECD SESSION IN PROGRESS**

A disk RC/V ECD session is in progress. Offline boot will be terminated.

**DKDRV HAS NOT CLOSED SPECIAL DEVICE FILE FOR g h**

Indicates that RTR pre-configuration has not completed because the DKDRV has not closed a file used in removing the specified device.

**ILLEGAL SW OFLBOOT COMMAND**

A side switch was requested outside of offline boot (that is, offline boot is not running).

**INCORRECT OLBSTATE c**

When EIH was processing a system initialization fault, it found that it had to resume offline boot activities. However, the state information was corrupt. Hence, EIH will not be able to resume the offline boot.

**INTERNAL DFC NUMBER CORRUPT**

Indicates corruption of EIH's internal offline boot data.

**INTERNAL DFC TABLE CORRUPT**

Indicates corruption of EIH's internal offline boot data.

**INTERNAL ERROR, BAD OLBSTATE c SEEK TECHNICAL ASSISTANCE**

An illegal instruction in EIH was found during the offline boot procedure.

**INTERNAL INITLEVEL CORRUPT**

A system wide initialization (FLT\_SINIT) was processed by EIH. EIH found it had to resume offline boot activities, but could not because the specified initialization level (2) might use a corrupt RC/V ECD. Offline boot will be terminated.

**INTERNAL IOP TABLE CORRUPT**

Indicates corruption of EIH's internal offline boot data.

**INTERNAL LOGIC ERROR**

Indicates a logic error has been encountered. Offline boot will be terminated.

**INTERNAL UNITS TABLE CORRUPT**

EIH used an RC/V ECD RID stored internally to read a RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.

SEE PROPRIETARY NOTICE ON COVER PAGE

**INVALID MESSAGE RECEIVED**

Invalid message was received from the process identified by its process ID.

**INVALID MESSAGE RECEIVED FROM AIM, ACTIVITY j**

Invalid message was received from AIM.

**INVALID MESSAGE RECEIVED FROM IODRV, TYPE k**

Invalid message was received from IODRV.

**INVALID OLBSTATUS FOR MESSAGE RECEIVED FROM AIM,  
ACTIVITY j**

The activity carried out by AIM is inconsistent with the current OLBSTATE.

**LAST OLBSTATE d INVALID**

During the stop offline boot sequence, state information used to determine how much work needs to be done was found to be corrupt. The stop sequence will assume the highest level of work is needed and continue.

**LAST OLBSTATE d INVALID FOR ABORT**

During the stop offline boot sequence, state information used to determine how much work needs to be done was found to be corrupt. The stop sequence will assume the highest level of work is needed and continue.

**LATE MESSAGE RECEIVED**

A message was received too late from the process identified by its process ID.

**LOW CORE AMODE CORRUPT**

Indicates corruption of low core.

**LOW CORE IOPMASK CORRUPT**

EIH cannot interpret the contents of the lowcore IOPMASK value because the contents of lowcore ORIGSIDE is corrupt.

**LOW CORE ORIGSIDE CORRUPT**

Indicates corruption of low core.

**MEMORY COPY FAILED**

A memory-to-memory copy failed because either the off-line CU never halted to allow the copy or there was a CC\_OTHM or CC\_OTHM fault.

**MESSAGE FROM AIM TOO LATE -- DISCARDING**

Message was received out of time from AIM. EIH took a default action, which could include terminating the offline boot procedure.

SEE PROPRIETARY NOTICE ON COVER PAGE

MESSAGE FROM PMPRC TOO LATE -- DISCARDING

Message was received out of time from PMPRC. EIH took a default action, which could include terminating the offline boot procedure.

MESSAGE FROM DKDRV TOO LATE -- DISCARDING

Message was received out of time from DKDRV. EIH took a default action, which could include terminating the offline boot procedure.

MESSAGE FROM VFYDISKECD TOO LATE -- DISCARDING

Message was received out of time from the VFYDISKECD process. EIH took a default action, which could include terminating the offline boot procedure.

MTTY OR ROP NOT ACTIVE FOR ONLINE SIDE

MTTY, or ROP, or both are not active for the on-line CU. Offline boot is not supported without an MTTY and a ROP. Offline boot will be terminated.

MUST BE ACT TO REMOVE

A device is in the wrong state to remove. The incorrect state is given in variable for the device state. which immediately precedes this text line.

MUST BE IN ACT OR INIT STATE TO DEGROW

A device is in the ACT or INIT states when it should be in a state valid for the degrowth operation (OOS state). The incorrect state is given in variable for the device state. which immediately precedes this text line.

MUST BE IN ACT OR INIT STATE TO REMOVE

A device is in the wrong state to remove. The incorrect state is given in variable for the device state. which immediately precedes this text line.

MUST BE OOS TO RESTORE

A device is not in the state that the offline boot procedure expects it to be. The incorrect state is given in variable for the device state. which immediately precedes this text line.

NO DISK FORCED

There is no DFC forced on-line.

NO TIMER SLOTS AVAILABLE

Indicates internal timer slots are all used up. Timer slots are freed at this point and the "no timer slots available" message is printed.

NOT ALL UNITS ARE OOS

Indicates not all units are OOS. Before offline boot moves a device to the off-line side, it first puts the device in the OOS state. One or more of the devices that are to be moved to the off-line side are not in the OOS state. Offline boot will be terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOT IN GROW STATE**

During the stop offline boot process, a unit has been found that is not in the correct state to allow it to be reconfigured back into service, or the unit in question has already been moved (not by offline boot) to some other unexpected state. In either case, the reconfiguration sequence is not followed for this device. The incorrect state is given in variable for the device state. which immediately precedes this text line.

**NOT IN UNEQIP STATE**

A device is not in the state that the offline boot procedure expects it to be. The incorrect state is given in variable for the device state. which immediately precedes this text line.

**NOT OOS**

EIH is expecting all the devices going to the off-line side to be in the OOS state. However, it has found that one or more of these devices are not in the OOS state. Offline boot will be terminated. The incorrect state is given in variable for the device state. which immediately precedes this text line.

**OFFLINE AIM REPORTED CHECKS FAILURE**

AIM reported pre-check errors.

**OFFLINE BOOT TIMED OUT**

The timer set for booting off-line has expired. Another timer will be set with the original timeout value and offline boot will continue until manually stopped or off-line AIM writes the completion word in low core.

**OFFLINE CU NOT RUNNING**

Output by the on-line CU, this message indicates that the off-line CU is not running. Offline boot will be terminated.

**OFFLINE LOW CORE BOOT STATUS IS CORRUPT**

The periodic monitor that checks whether AIM has written the boot completion word in the off-line low core found the contents of the word corrupt. It will assume that the boot is not done.

**OFFLINE RTR CHECKS FAILED ERROR m**

UNIX® RTR encountered pre-check errors. Error is given in variable for the pre-check errors.

**OFFLINE RTR-AIM COMMUNICATION FAILED**

Indicates EIH could not send a message to AIM in the off-line side or that AIM did not reply on time.

**OFFLINE SIDE DID NOT COMPLETE THE LBOOT STEP**

If failure PRMs are present, they will indicate that the disk unit (MHD 0 or MHD 1) used to boot the offline side is bad. Examples of corruption are a bad or non-existent VTOC or junk in the LBOOT partition. If failure PRMs are not present, there may be a problem with the MCH or the CU complex.

SEE PROPRIETARY NOTICE ON COVER PAGE

**OLBABORT EVENT RECEIVED -- ABORTING**

Indicates EIH has received an abort event; procedures to stop the offline boot have begun. Procedures will attempt to restore units.

**OLBCONFIG EVENT RECEIVED -- ABORTING**

Indicates EIH has received an abort event because an essential device like an SCC or MHD is not active nor unequipped; procedures to stop the offline boot have begun. Procedures will attempt to restore units.

**OLBSTATE C EXPECTED EXC\_BOOT OR SW\_PRCHK**

A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

**OLBSTATE C NOT EXC\_AIMECD**

A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

**OLBSTATE C NOT EXC\_CFGAIM**

A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

**OLBSTATE C NOT EXC\_POSTSW**

A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

**OLBSTATE C NOT EXC\_RMV**

A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

**OLBSTATE C NOT STOP\_IOPS**

A timer expired, but the offline boot state machine was not in the state where the timer is valid. No action will be taken on the message; it will be discarded.

**PORT SWITCH NOT DONE**

The IODRV returned a port switch request message with a success code. However, when EIH verified this against the ECD, it found that the devices had not really been port switched.

**RC/V ECD SESSION IN PROGRESS**

An incore RC/V ECD session is in progress. Offline boot will be terminated.

SEE PROPRIETARY NOTICE ON COVER PAGE

RESTORE OF MTTY,ROP,SCC AND/OR SCSDC FAILED AFTER  
SIDE SWITCH

During a side-switch, EIH received a message from the IODRV saying that it could not restore an MTTY, ROP, SCC, or SCSDC device.

RETROFIT NOT SPECIFIED -- REDUPLEXING

Call origination could not be turned on in the new on-line side during a side switch. Since the RETROFIT option was not specified, offline boot will be terminated immediately.

RETROFIT SPECIFIED -- CONTINUING

Call origination could not be turned on in the new on-line side during a side switch. Since the RETROFIT option was specified, the side switch will continue its normal sequence. Notice, however, there is no call origination going on.

SANITY TIMER NOT CLEARED

The off-line sanity timer cannot be cleared.

SIM COULD NOT BLOCK r s t AUDITS REASON u

SIM reported to EIH that it could not block the requested audits. The requested audit name, with member number, and the audit instance name. The reason is explained by the code.

SIM COULD NOT UNBLOCK r s t AUDITS REASON u

SIM reported to EIH that it could not unblock the requested audits. The requested audit name, with member number, and the audit instance name. The reason is explained by the code.

SOME TERMINAL(S) UNDER OFF-LINE IOP MAY BE LOCKED

Some IOP assigned to the off-line side will not have all its subdevices equipped, and as a consequence, some terminal in the office, if any, will appear to be locked, i. e., the information displayed is out-dated, and no input is accepted.

STOP DENIED DURING SWITCH

Offline boot cannot be stopped manually or through application requests during a side switch.

SWITCH CALL PROCESSING OFF FAILED

AIM reported call origination could not be turned off in preparation for side switching. If retrofit was not specified, SW:OFLBOOT will fail.

SWITCH CALL PROCESSING ON FAILED

AIM reported call origination could not be turned on.

SWITCH POSTSW FAILED

AIM reported post-switch work failed. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

SEE PROPRIETARY NOTICE ON COVER PAGE

**SWITCH POSTSW TIMED OUT**

AIM post-switch work timed out. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

**SWITCH PRE-CHECK ONLY COMPLETED**

The pre-check only option was specified in the application message requesting the side switch (that is, not a manual request to side switch).

**SWITCH TERMINATED**

The side switch was terminated. There may be some application recovery needed. For example, it is possible that call origination is still turned off.

**SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS**

Command line options do not match system status. This message will be output if any of the conditions are true:

- Required unit is OOS and neither OOS nor UCL was specified.
- Specified TTY does not exist.
- Specified IOP does not exist.
- Both IOP 0 and IOP 1 are selected for moving to the off-line side.
- A primary disk was not forced.
- A CU is forced.
- Only one bootable disk is available or one of the bootable disks is not equipped.
- Mate CU state is not STBY or OOS.
- If any RC/V ECD UCB record is reserved..

This list is not exhaustive. Another output message has been output prior to this output message describing the problem.

**TIME OUT - AIM POST-BOOT CHECKS**

EIH did not receive results of activities before timers expired. Either the on-line side or the off-line side timer to receive the results from the off-line AIM post-boot checks has expired. These post-boot results will not be available.

**TIME OUT - AIM PRECONFIGURATION**

EIH did not receive results of activities before timers expired.

**TIME OUT - CANNOT REMOVE EITHER CU, DFC AND/OR IOP**

EIH did not receive all the successful removal confirmation messages when the timer expired. It verified against the RC/V ECD that not all of the units were in the OOS state as expected.

SEE PROPRIETARY NOTICE ON COVER PAGE

**TIME OUT DUPLEX ECD: AIM REPORTED x, RTR REPORTED x**

This message always results in continuing the STOP sequence in progress to the point where IOPs are duplexed and then to the end part of the STOP. Although AIM is involved in the STOP sequence, it did not cause the timeout. Therefore, the AIM duplex completion value given is printed for information purposes only. If value given is NOTHING, AIM had not finished its duplexing at the moment the timeout occurred. If value given is SUCCESS, AIM had successfully finished its STOP sequence. If value given is FAILURE, AIM reported errors during its STOP sequence. This timeout was caused by RTR problems when growing DFC units. A value of NOTHING means RTR did not complete or report to EIH the status of the grow operations for the DFC units involved in the STOP sequence. A value of FAILURE means RTR failed to complete the grow operations for the DFCs units involved in the STOP sequence. A value of SUCCESS means RTR indicated a successful grow of the DFC units involved in a side switch; a logic error happened.

**TIME OUT FOR RECEIVING RESULTS OF POST-BOOT CHECKS**

EIH did not receive results of activities before timers expired. Either the on-line side or the off-line side timer to receive the results from the off-line AIM post-boot checks has expired. These post-boot results will not be available.

**TIME OUT RTR GROW: AIM REPORTED x, RTR REPORTED x**

This message always results in termination of the offboot procedure. AIM is not involved in the side switch growth of units, hence, the value given is always NOTHING; otherwise, a logic error happened. A value of NOTHING means RTR did not complete or did not report to EIH the status of the grow operations for the MTTY, ROP, SCC, and SCSDCs units involved in a side switch. A value of FAILURE means RTR failed to complete the grow operations for the MTTY, ROP, SCC, and SCSDCs units involved in a side switch. A value of SUCCESS means RTR indicated a successful grow of the units involved in a side switch; a logic error happened.

**TIME OUT SPLIT ECD: AIM REPORTED x, RTR REPORTED x**

This message always results in termination of the offboot procedure. A value of NOTHING means AIM or RTR or both did not complete or did not report to EIH the status of the split operation. A value of FAILURE means AIM or RTR or both failed to complete the split operation. A value of SUCCESS means AIM or RTR or both indicated a successful split of its units. Notice that, if both are SUCCESS, a logic error happened.

SEE PROPRIETARY NOTICE ON COVER PAGE

TIME OUT WHEN GROWING g h

EIH did not receive the result of growing an IOP unit or sub-unit. The specified unit and its sub-units if any will be left in the UNEQIP state.

TRYING TO WRITE INVALID BOOTSTATUS TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID IOPMASK TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID IOPSUBUNIT TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID MODE TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID MODIFIEDEC D TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID OFLTTY TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID OLBACK TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID OLBDFC TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID OLBTRACE TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID OLBUC L TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID ORIGSIDE TO LOW CORE

EIH is trying to write an invalid value to low core.

TRYING TO WRITE INVALID VALUE TO LOW CORE

EIH is trying to write an invalid value to low core.

UNEXPECTED MESSAGE FROM AIM

EIH received a message from AIM (type OFLBOOT) whose activity was OLBPRECHK. However, EIH's internal state information (OLBSTATE) was inconsistent with the value specified in lowcore MODE for the specified activity (OLBPRECHK). This situation indicates either an illegal message was received from AIM or that a message buffer was overwritten and corrupted. EIH will drop this message and not take action on it.

UNEXPECTED MESSAGE RECEIVED FROM

EIH received a message it cannot identify. The process ID and message type are provided to help identify the message.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### UNIT REMOVAL FAILURE

During a side switch, the following devices are removed from the on-line side: MTTY, ROP, SCC, and SCSDs. The IODRV returned a message stating that one or more of these devices could not be moved to the OOS state. The side switch will continue. Furthermore, to prevent the IODRV from stealing these devices from the new on-line side, their RC/V ECD UCB records will be unequipped and messages will be sent to the IODRV to move them to the DEGROW state.

- c Current offline boot state.
- d Previous offline boot state.
- e Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.
- f Line number in the function from which the output message originated. This field is used by UNIX® RTR, in conjunction with fields for current offline boot state, previous offline boot state, and name of the function from which the output message originated, to diagnose offline boot problems.
- g String giving device type information; CU, DFC, IOP, MHD, TTY, TTYC, and DSCH, for example. Unit names are listed in the Member Number Input Appendix C, APP:MEM-NUM-C.
- h Device number. A value of zero, which used with string giving device type information; could form DFC 0, for example.
- i Process identification number.
- j Activity defined in message sent from the AIM process.
- k Message type in message sent from the IODRV, AIM, or any other unknown process.
- l Reason message could not be sent:
  - 1 — Cannot allocate system message buffer.
  - 0 — Process is not attached to its port or port is invalid.
  - 8192 — Process cannot queue more messages.
- m Pre-check errors:
  - 1 — Offline side is running in minimum configuration mode. System must be in full configuration mode for a side switch.
  - 2 — Internal DFC table corrupt. Indicates corruption of EIH's internal offline boot data.
  - 3 — Cannot get a DFC UCB record to get information for running pre-checks.
  - 4 — An offline side DFC or DFC sub-unit is in the INIT state.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — Corrupt ECD UCB record for a DFC or DFC sub-unit. The device is in the STBY state which is not supported for DFC communities.
- 6 — An offline side DFC or DFC sub-unit either has a non-supported essential field or it is an essential or no\_man\_rmv device that is not active. For the latter, it could be UNAV, OFL, OOS, or GROW.
- 7 — Corrupt ECD UCB record for a DFC or DFC sub-unit. The device has an unsupported major state field in its UCB.
- 10 — Low core IOPMASK corrupt. EIH cannot interpret the contents of the low core IOPMASK value because the contents of low core ORIGSIDE is corrupt.
- 11 — No IOP in the off-line side. Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have a MTTY or ROP on the other side.
- 12 — No IOP in the off-line side. Indicates that IOP 0 and IOP 1 are both on the on-line side. The switch will fail because it will not have a MTTY or ROP on the other side.
- 13 — Low core ORIGSIDE corrupt. Indicates corruption of low core.
- 14 — Internal IOP table corrupt. Indicates corruption of EIH's internal offline boot data.
- 15 — Cannot get IOP 0 or 1 UCB record to get information for running pre-checks.
- 16 — Internal units table corrupt. EIH used an RC/V ECD RID stored internally to read a RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.
- 17 — Not ACT. The IOP is not in the ACT state.
- 18 — Diagnostics running. Indicates the specified IOP, 0 or 1, RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.
- 19 — The off-line side is running in full Disk Independent Operation (DIOP) mode. The offline boot procedure cannot side switch to an impaired side.
- 20 — Cannot get MTTYC 0 or 1 UCB record to get information for running pre-checks.
- 21 — Internal units table corrupt. EIH used an RC/V ECD RID stored internally to read a MTTY controller RC/V ECD UCB record into a local buffer. When EIH tried to verify the buffer information, it found the device type field to be inconsistent. This situation indicates that, although the RID used by EIH was a valid one, it

SEE PROPRIETARY NOTICE ON COVER PAGE

pointed to the incorrect UCB. That is, EIH's RID storage is corrupt. Also this could mean that the RC/V ECD UCB record itself is corrupt.

- 22 — Not ACT. MTTYC 0 or 1 is not in the ACT state.
- 23 — Diagnostics running. Indicates MTTYC 0 or 1 RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.
- n Possible reason codes why EIH could not output a post-mortem report:
  - 10 — Cannot copy post-mortem slots from off-line CU - the on-line CU is holding information in its slots.
  - 11 — RMF is not running.
  - 12 — Cannot copy off-line post-mortem slots.
- o RID of the RC/V ECD UCB record for the unit that cannot be restored automatically.
- p Memory location where the invalid value RID is being written.
- q Invalid value that is being written to low core.
- r RID of the RC/V ECD UCB record for the unit that cannot be removed.
- s Device state.
- t Audit name, such as ECD.
- u Audit member number, such as 1, 2, or 3.
- v Audit instance, such as "ecd" or "appecd".
- w Possible errors codes returned by SIM to the EIH request to block or unblock an ECD audit:
  - 3 — Audit system initialization in progress.
  - 4 — Audit system initialization failed.
  - 5 — Access to audit record in the ECD failed.
  - 9 — Requested audit instance is blocked.
  - 19 — Invalid audit specified.
  - 20 — Invalid audit instance specified.
  - 30 — Request resulted in no change.
- x FAILURE  
NOTHING  
SUCCESS

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

- ABORT DENIED DURING SWITCH — Indicates AIM tried to abort the offline boot while SW:OFLBOOT was executing.
- ADP IS NOT RUNNING, CANNOT RESTORE g h — Restore the unit manually.
- AIM PRINTING OF PRE-CHECKS OR POST-CHECKS TIMED OUT — This message is for information only; no action is needed.
- AIM REPORTED FAILURE TO REDUPLEX — Wait for offline boot to terminate. Some application devices may be in an incorrect state. If so, issue a STOP:OFLBOOT;RST command within 1 hour. Once the hour is passed, manual actions will be required to restore the application devices to their original states.
- AIM REPORTED FAILURE TO SPLIT — Wait for offline boot to terminate, clear the problem with the application, and try offline boot again.
- AIM REPORTED FAILURE TO TURN CALL PROCESSING OFF — If retrofit was not specified, offline boot will be terminated on the current on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.
- AIM REPORTED FAILURE TO TURN CALL PROCESSING ON — If retrofit was not specified, offline boot will be terminated on the new on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.
- AIM REPORTED PRE-CONFIGURATION FAILURES — Wait for offline boot to terminate, then try offline boot again.
- CANNOT ACCESS A DIAGNOSTIC/MAINTENANCE SPECIAL DEVICE FILE — Wait for offline boot to terminate, then try offline boot again.
- CANNOT ACCESS ECD — Wait for offline boot to be terminated, then run RC/V ECD audits.
- CANNOT CLOSE SPECIAL DEVICE FILE — Seek technical assistance.
- CANNOT COPY MEMORY AREA FROM OFFLINE CU TO ONLINE CU — Wait for offline boot to terminate, then try offline boot again.
- CANNOT COPY MEMORY AREA FROM ONLINE CU TO OFFLINE CU — Wait for offline boot to terminate, then try offline boot again.
- CANNOT CREATE VFYDISKECD PROCESS — Wait for offline boot to terminate, then try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CANNOT DETERMINE ACT IOP FOR MTTY OR ROP — If there is no active MTTY or ROP, restore them and try offline boot again. Otherwise, RC/V ECD is corrupt and RC/V ECD audits must be run. If the audits pass, try offline boot again.
- CANNOT DETERMINE IF OFFLINE SIDE IS RUNNING — If the message did not result in an automatic termination of offline boot, manually stop the procedure. Once offline boot is stopped, run the CU diagnostics, phases 1 through 4, 11, and 62; if successful, try offline boot again.
- CANNOT GROW g h — Manual recovery is needed to restore the device to its pre-offline boot state.
- CANNOT OUTPUT POST MORTEM, REASON n — If the reported reason was 10 or 12, the problem is either that the output slot is being used by a higher priority message or that EIH is unable to complete copy. In either case, no action is needed. A reason of 11 indicates that the Recovery Message Formatter (RMF) process is not running; seek technical assistance.
- CANNOT PORT SWITCH MTTY — Indicates there were errors in port switching a device. Check device state and restore if needed.
- CANNOT PORT SWITCH MTTY OR ROP — Manual recovery is needed to restore the device to its pre-offline boot state.
- CANNOT PORT SWITCH ROP — Manual recovery is needed to restore the device to its pre-offline boot state.
- CANNOT READ OFFLINE CU SSR — Wait for offline boot to terminate, then run the CU diagnostics, phases 1 through 4, 11, and 63, to check the maintenance channel. If these particular phases do not reveal anything then run the complete CU diagnostics before trying offline boot again.
- CANNOT RECONFIGURE CU COMMUNITY — Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
- CANNOT RELEASE AN MDCT RECORD — A scarce system resource (a MDCT record of type diagnostic) has been lost. To recover it, run the ECDOWN audit or manually unreserve the RC/V ECD MDCT record.
- CANNOT REMOVE DFC — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
- CANNOT REMOVE IOP — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
- CANNOT RESET SANITY TIMERS — This message is for information only; no action is needed.

SEE PROPRIETARY NOTICE ON COVER PAGE

- CANNOT RESTORE TO ORIGINAL STATE g h — Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
- CANNOT RESTORE g h — Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
- CANNOT SEND DEGROWTH MESSAGE TO IODRV — Wait for offline boot to terminate, then try offline boot again.
- CANNOT SEND GROWTH MESSAGE TO DKDRV — Manual recovery is needed to restore the device to its pre-offline boot state.
- CANNOT SEND GROWTH MESSAGE TO IODRV — Manual recovery is needed to restore the device to its pre-offline boot state.
- CANNOT SEND IOCLOSE MESSAGE TO DKDRV — This message can occur twice. The first time this message occurs, ignore it; no action is needed. The second time this message prints, seek technical assistance.
- CANNOT SEND IOOPEN MESSAGE TO DKDRV — Wait for offline boot to terminate, then try offline boot again.
- CANNOT SEND MESSAGE TO PMPRC — Wait for offline boot to terminate, then try offline boot again.
- CANNOT SEND MESSAGE TO USER PROCESS, PID i — This message is for information only; no action is needed.
- CANNOT SEND OLBCPOFF MESSAGE TO AIM ERROR l — If retrofit was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If retrofit was specified, the side switch will continue; no action is needed.
- CANNOT SEND OLBCPON MESSAGE TO AIM ERROR l — If retrofit was not specified, offline boot will be terminated on the new on-line side. If retrofit was specified, wait for the side switch to complete, then manually stop offline boot. In either case, after offline boot is stopped or terminated, take whatever manual recovery steps are needed to re-establish call origination.
- CANNOT SEND OLBDUPLEX MESSAGE TO AIM ERROR l — Application recovery must be carried out manually.
- CANNOT SEND OLBPOSTSW MESSAGE TO AIM ERROR l — Seek technical assistance.
- CANNOT SEND OLBPRECFG MESSAGE TO AIM ERROR l — Wait for offline boot to terminate, then try offline boot again.
- CANNOT SEND OLBPRECHK MESSAGE TO AIM ERROR l — The action to be taken depends on the function name output with the message:
- HDL\_OLB\_OPCODE — The off-line side EIH could not ask AIM to perform post-boot checks. No action is needed.

SEE PROPRIETARY NOTICE ON COVER PAGE

- OLBCONTROL — The off-line side EIH could not ask AIM to perform side switch pre-checks; try the side switch again.
- CANNOT SEND OLBPRINT MESSAGE TO AIM ERROR 1 — This message is for information only; no action is needed.
- CANNOT SEND OLSPLIT MESSAGE TO AIM ERROR 1 — Wait for offline boot to terminate, then try offline boot again.
- CANNOT SEND REC\_UPDATE MESSAGE TO DKDRV — DKDRV did not have a chance to update its disk display pages. Restart the DKDIP process to have the pages show the correct information.
- CANNOT SEND UNTRMV MESSAGE TO DKDRV — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
- CANNOT SEND UNTRMV MESSAGE TO IODRV — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
- CANNOT SEND UNTRST MESSAGE TO IODRV — Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
- CANNOT UNEQIP DEVICES — Check to see why the device cannot be unequipped, resolve the problem, and try offline boot again.
- CANNOT UNEQIP g h — Check to see why the device cannot be unequipped, resolve the problem, and try offline boot again.
- CANNOT UPDATE ECD — The action to be taken depends on the function name output with the message:
- DFS — Run RC/V ECD audits. If the audits pass, try offline boot again.
  - UNRESERVE — If diagnostics are not running, then the RC/V ECD UCB record is corrupted; in which case, the UCB record needs to be unreserved manually or through the ECDOWN audit.
- CC\_OTH A IN THE ON-LINE — Seek technical assistance to run diagnostics.
- CC\_OTH C IN THE ON-LINE — Seek technical assistance to run diagnostics.
- CC\_OTH D IN THE ON-LINE — Seek technical assistance to run diagnostics.
- CC\_OTH T IN THE ON-LINE — Seek technical assistance to run diagnostics.
- CHANGED DISK FORCES — Wait for offline boot to terminate, force a DFC, and try again to boot off-line.

SEE PROPRIETARY NOTICE ON COVER PAGE

CORRUPT TIMER SLOT — Notify technical assistance about this occurrence. No other action needs to be taken for STOP:OFLBOOT to complete.

CORRUPT VALUE FOR ABORT TIMER — Notify technical assistance about this occurrence. No other action needs to be taken for STOP:OFLBOOT to complete.

COULD NOT PORT SWITCH — Indicates there were errors in port switching a device. Check device state and restore if needed.

COULD NOT TELL SIM TO BLOCK ECD 1 AUDITS — This message is for information only; no action is needed.

COULD NOT TELL SIM TO BLOCK ECD 3 AUDITS — This message is for information only; no action is needed.

COULD NOT TELL SIM TO BLOCK ECD 2 (APPECD) AUDITS — This message is for information only; no action is needed.

COULD NOT TELL SIM TO BLOCK ECD 2 (ECD) AUDITS — This message is for information only; no action is needed.

COULD NOT TELL SIM TO UNBLOCK ECD 1 AUDITS — Save the ROP output and report this incident to technical assistance.

**NOTE:** The audits will automatically be unblocked in six hours.

COULD NOT TELL SIM TO UNBLOCK ECD 3 AUDITS — Save the ROP output and report this incident to technical assistance.

**NOTE:** The audits will automatically be unblocked in six hours.

COULD NOT TELL SIM TO UNBLOCK ECD 2 (APPECD) AUDITS — Save the ROP output and report this incident to technical assistance.

**NOTE:** The audits will automatically be unblocked in six hours.

COULD NOT TELL SIM TO UNBLOCK ECD 2 (ECD) AUDITS — Save the ROP output and report this incident to technical assistance.

**NOTE:** The audits will automatically be unblocked in six hours.

DFC PRECHECKS FAILED — Investigate the cause of the pre-check error, resolve the problem indicated, and try offline boot again.

DISK RC/V ECD SESSION IN PROGRESS — Wait for the RC/V ECD session to complete, then try offline boot again.

DKDRV HAS NOT CLOSED SPECIAL DEVICE FILE FOR g h — This message is for information only; no action is needed.

ILLEGAL SW OFLBOOT COMMAND — If an offline boot was underway, then the low core value of MODE has been corrupted; seek technical assistance. Otherwise, boot off-line and then side switch.

SEE PROPRIETARY NOTICE ON COVER PAGE

INCORRECT OLBSTATE c — A manual STOP:OFLBOOT will be necessary because offline boot will not continue. Depending on the amount of state information corrupted, the STOP:OFLBOOT may result in cascading error messages; the stop process will complete, however.

INTERNAL DFC NUMBER CORRUPT — The action to be taken depends on the function name output with this message:

DEGROW\_DFC — RMV\_DFC - Wait for offline boot to be terminated.  
Run RC/V ECD audits, then retry offline boot.

CHG\_DFC — The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.

RST\_DFC — The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

INTERNAL DFC TABLE CORRUPT — The action to be taken depends on the function name output with this message:

DEGROW\_DFC — RMV\_DFC - Wait for offline boot to be terminated.  
Run RC/V ECD audits, then retry offline boot.

CHG\_DFC — The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.

RST\_DFC — The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.

INTERNAL ERROR, BAD OLBSTATE c SEEK TECHNICAL ASSISTANCE — Seek technical assistance.

INTERNAL INITLEVEL CORRUPT — Wait for offline boot to be terminated, restore the CU community, and try offline boot again.

INTERNAL IOP TABLE CORRUPT — The action to be taken depends on the function name output with this message:

DEGROW\_IOPS — RMV\_IOPS - Wait for offline boot to be terminated.  
Run RC/V ECD audits, then retry offline boot.

GROW\_IOPS — The device will remain in the UNEQIP state. If this was not its original state, wait for offline boot to be terminated, then manually grow the device community and restore it to service.

SEE PROPRIETARY NOTICE ON COVER PAGE

- RST\_IOPS — The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.
- INTERNAL LOGIC ERROR — Save the ROP output and seek technical assistance.
- INTERNAL UNITS TABLE CORRUPT — The action to be taken depends on the function name output with this message:
- CHECK\_OOS — DEGROW\_DFC, DEGROW\_IOPS, RMV\_DFC, RMV\_IOPS - Wait for offline boot to be terminated. Run RC/V ECD audits, then retry offline boot.
- CHG\_DFC — The device will remain in the GROW state. If this was not its original state, wait for offline boot to be terminated, then manually change the device community to the OOS state and restore it to service.
- EQUIP\_CU — GROW\_DFC, GROW\_IOPS - The device will remain in the UNEQIP state. If this was not its original state, wait for offline boot to be terminated, then manually grow the device community and restore it to service.
- RST\_DFC — The device will remain in the OOS state. If this was not its original state, wait for offline boot to be terminated, then manually restore the device community to service.
- SWPRECHECK — The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete.
- INVALID MESSAGE RECEIVED — Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.
- INVALID MESSAGE RECEIVED FROM AIM, ACTIVITY j — Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.
- INVALID MESSAGE RECEIVED FROM IODRV, TYPE k — Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.
- INVALID OLBSTATUS FOR MESSAGE RECEIVED FROM AIM, ACTIVITY j — Continue the offline boot procedure, save the ROP output, and report this incident to technical assistance.
- LAST OLBSTATE d INVALID — No action is needed.
- LAST OLBSTATE d INVALID FOR ABORT — Seek technical assistance.
- LATE MESSAGE RECEIVED — This message is for information only; no action is needed.
- LOW CORE AMODE CORRUPT — Save the ROP output and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

LOW CORE IOPMASK CORRUPT — If OLBSTATE is EXC\_ONLECD, wait for offline boot to be terminated, then try it again.

If the function name is SWPRECHECK, the side switch will not succeed. To retry to side switch, first, stop offline boot manually; second, start another offline boot; and third, try the side switch again after offline boot completes.

Otherwise, this is happening during the offline boot stop sequence. Some DFCs or IOPs belonging to the off-line side will remain in the UNEQIP, GROW, or OOS state. If these were not the original states, manually move the devices to their original states.

LOW CORE ORIGSIDE CORRUPT — If OLBSTATE is EXC\_ONLECD, wait for offline boot to be terminated, then try it again.

If the function name is SWPRECHECK, the side switch will not succeed. To retry to side switch, first, stop offline boot manually; second, start another offline boot; and third, try the side switch again after offline boot completes.

Otherwise, this is happening during the offline boot stop sequence. Some DFCs or IOPs belonging to the off-line side will remain in the UNEQIP, GROW, or OOS state. If these were not the original states, manually move the devices to their original states.

MEMORY COPY FAILED — This message is for information only; no action is needed.

MESSAGE FROM AIM TOO LATE -- DISCARDING — This message is for information only; no action is needed.

MESSAGE FROM PMPRC TOO LATE -- DISCARDING — This message is for information only; no action is needed.

MESSAGE FROM DKDRV TOO LATE -- DISCARDING — This message is for information only; no action is needed.

MESSAGE FROM VFYDISKECD TOO LATE -- DISCARDING — This message is for information only; no action is needed.

MTTY OR ROP NOT ACTIVE FOR ONLINE SIDE — Check the status of the MTTY and ROP, restore the device that is not in the ACT state, and try offline boot again.

MUST BE ACT TO REMOVE — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

MUST BE IN ACT OR INIT STATE TO DEGROW — This message should read CANNOT BE IN ACT OR INIT STATE TO DEGROW. Stop offline boot manually, change the state of the device, and try offline boot again.

MUST BE IN ACT OR INIT STATE TO REMOVE — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

- MUST BE OOS TO RESTORE** — Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.
- NO DISK FORCED** — If printed while executing EXC:OFLBOOT, wait for offline boot to terminate, force a DFC, and try again to boot off-line. If this message is printed as part of SW:OFLBOOT, wait for the side switch to fail, force the DFCs as they were at the beginning of the offline boot, and try to side switch again.
- NO TIMER SLOTS AVAILABLE** — This message is for information only; no action is needed.
- NOT ALL UNITS ARE OOS** — Wait for offline boot to be terminated. Check on why the DFC and all the IOPs to be moved to the off-line side are not in the OOS state. Resolve the problem, and then try offline boot again.
- NOT IN GROW STATE** — After the offline boot process is terminated, check whether this device requires manual action to be brought back to its original state.
- NOT IN UNEQIP STATE** — No action is needed.
- NOT OOS** — Wait for offline boot to be terminated. Then, check the states of the devices that were going to the off-line side. If any device is not in the OOS state, investigate why. After resolving any problem, try offline boot again.
- OFFLINE AIM REPORTED CHECKS FAILURE** — If post-boot checks failed, no action is needed. If side switch pre-checks failed, investigate what caused the pre-check error, resolve the problem, and try the side switch again.
- OFFLINE BOOT TIMED OUT** — Either manually stop offline boot or let it run until it completes. If this message is seen twice or more, offline boot may not complete and manually stopping it is recommended.
- OFFLINE CU NOT RUNNING** — Check the on-line CU to see why it terminated. There may be some information in the off-line side post-mortem dump if one was output as part of the offline boot termination. If nothing is determined, try offline boot again after the termination is complete.
- OFFLINE LOW CORE BOOT STATUS IS CORRUPT** — If the failure is part of a side switch, the side switch will be aborted if the RETROFIT option was not specified. If the RETROFIT option was specified, the system will be booted on the side targeted for switching and offline boot will terminate.
- NOTE:** If the reason for failure indicates bad hardware, it is recommended to stop the offboot procedure and reschedule it when the hardware has been repaired.
- OFFLINE RTR CHECKS FAILED ERROR m** — The action to be taken depends on the value of variable for the pre-check errors:
- 1 To side switch, stop offboot and execute EXC:OFLBOOT without specifying the MINCONFIG option. When this second offline boot completes, try the side switch again.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 2 Seek technical assistance.
- 3 The error is in the off-line side ECD which cannot be audited; seek technical assistance.
- 4 Wait for the INIT operation to complete and run SW:OFLBOOT again.
- 5 The error is in the off-line side ECD which cannot be audited; seek technical assistance.
- 6 If the error is an invalid essential field then it is in the off-line side ECD which cannot be audited; seek technical assistance. ESSENTIAL or NOMANRMV devices in GROW and OFL will fail the switch always; stop offline boot manually and seek technical assistance. ESSENTIAL or NOMANRMV devices in UNAV and OOS should be restored, then run SW:OFLBOOT again. If the restore operations fail the switch will always fail; stop offline boot manually and seek technical assistance.
- 7 The error is in the off-line side ECD which cannot be audited; seek technical assistance.
- 10 Seek technical assistance.
- 11 Stop offline boot; wait for it to terminate. Try offboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try SW:OFLBOOT again.
- 12 Stop offline boot; wait for it to terminate. Try offboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try SW:OFLBOOT again.
- 13 Seek technical assistance.
- 14 Seek technical assistance.
- 15 The error is in the off-line side ECD which cannot be audited; seek technical assistance.
- 16 Seek technical assistance.
- 17 Restore the IOP and run SW:OFLBOOT again.
- 18 Run SW:OFLBOOT again after diagnostics complete.
- 19 Stop offboot, repair the equipment that caused the off-line side to go into DIOP and execute EXC:OFLBOOT. When this second offline boot completes, try the side switch again.
- 20 The error is in the off-line side ECD which cannot be audited; seek technical assistance.
- 21 If there is no active MTTY controller, restore it and try offline boot again. Otherwise, RC/V ECD is corrupt and RC/V ECD audits must be run. If the audits pass, try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 22 Restore the MTTY controller and run SW:OFLBOOT again.
- 23 Run SW:OFLBOOT again after MTTY controller diagnostics complete.

OFFLINE RTR-AIM COMMUNICATION FAILED — Check OLBLOG files on the off-line side to determine if AIM has a problem. Do NOT start a side switch if it does. Also, recover OLBLOG files and send them to technical assistance. If the message was part of a retrofit side switch, watch for correct operation on the new on-line side as AIM was having problems and it may not support call origination.

OFFLINE SIDE DID NOT COMPLETE THE LBOOT STEP — Wait for offline boot to terminate. If a disk is bad do not boot from it, booting from a corrupted disk can cause an outage; seek technical assistance. If the CU or MCH appears to be the problem, then run the CU diagnostics, phases 1 through 4, 11, and 63, to check the maintenance channel. If these particular phases do not reveal anything, then run the complete CU diagnostics before trying offline boot again.

OLBABORT EVENT RECEIVED -- ABORTING — No action is needed.

OLBCONFIG EVENT RECEIVED -- ABORTING — Restore or unequip the affected essential device before trying offline boot again.

OLBSTATE c EXPECTED EXC\_BOOT OR SW\_PRCHK — Save the ROP output and notify technical assistance of this occurrence.

OLBSTATE c NOT EXC\_AIMECD — Save the ROP output and notify technical assistance of this occurrence.

OLBSTATE c NOT EXC\_CFGAIM — Save the ROP output and notify technical assistance of this occurrence.

OLBSTATE c NOT EXC\_POSTSW — Save the ROP output and notify technical assistance of this occurrence.

OLBSTATE c NOT EXC\_RMV — Save the ROP output and notify technical assistance of this occurrence.

OLBSTATE c NOT STOP\_IOPS — Save the ROP output and notify technical assistance of this occurrence.

PORT SWITCH NOT DONE — Indicates there were errors in port switching a device. Check device state and restore if needed.

RC/V ECD SESSION IN PROGRESS — Wait for the RC/V ECD session to complete, then try offline boot again.

RESTORE OF MTTY,ROP,SCC AND/OR SCSDC FAILED AFTER SIDE SWITCH — Manual recovery may be needed to restore the device(s). This can indicate RC/V ECD corruption. In this case, wait until offline boot is terminated, restore the devices, and run RC/V ECD audits.

RETROFIT NOT SPECIFIED -- REDUPLEXING — Indicates offline boot has encountered fatal errors and the RETROFIT option was not specified, so offline boot is terminated and the system is immediately reduplexed.

SEE PROPRIETARY NOTICE ON COVER PAGE

When offline boot has terminated, perform whatever manual recovery steps are needed to re-establish call origination.

RETROFIT SPECIFIED -- CONTINUING — If function name is TIM\_CPON, call origination is down. Wait for the side switch to finish, manually stop offline boot, and then take whatever actions are needed to re-establish call origination.

SANITY TIMER NOT CLEARED — This message is for information only; no action is needed.

SIM COULD NOT BLOCK r s t AUDITS REASON u — This message is for information only; no action is needed.

SIM COULD NOT UNBLOCK r s t AUDITS REASON u — Save the ROP output and report this incident to technical assistance.

**NOTE:** The audits will automatically be unblocked in six hours.

SOME TERMINAL(S) UNDER OFF-LINE IOP MAY BE LOCKED — No action is needed.

STOP DENIED DURING SWITCH — Wait until the side switch is finished, try STOP:OFLBOOT again on the new on-line side.

SWITCH CALL PROCESSING OFF FAILED — If retrofit was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If retrofit was specified, the side switch will continue; no action is needed.

SWITCH CALL PROCESSING ON FAILED — Check OLBLOG files on the off-line side to determine if AIM has a problem. If call origination is turned off, take whatever actions are needed to re-establish call origination.

SWITCH POSTSW FAILED — Check to see if manual recovery is needed.

SWITCH POSTSW TIMED OUT — Check to see if manual recovery is needed.

SWITCH PRE-CHECK ONLY COMPLETED — This message is for information only; no action is needed.

SWITCH TERMINATED — Check to see if manual recovery is needed. It is possible that call origination is still turned off.

SYSTEM STATUS INCONSISTENT WITH COMMAND LINE OPTIONS — If this message is preceded by a pre-check failure message, follow the action to be taken specified by the preceding message. If not, then an initialization level of 2 was specified and the CU is in the OOS state. In this case, offline boot cannot continue because the OOS CU memory will be used for booting and it may be corrupt. Either specify a higher initialization level or restore the CU before trying the offline boot again.

TIME OUT - AIM POST-BOOT CHECKS — No action is needed.

TIME OUT - AIM PRECONFIGURATION — Wait for offline boot to terminate, then try offline boot again.

SEE PROPRIETARY NOTICE ON COVER PAGE

- TIME OUT - CANNOT REMOVE EITHER CU, DFC AND/OR IOP — Check the device to see why it could not be removed, restore it to its pre-offline boot state or state needed to boot off-line, and try offline boot again.
- TIME OUT DUPLEX ECD: AIM REPORTED x, RTR REPORTED x — Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be grown. Manually, grow those units and move them to OOS through RC/V; then restore them. If the message indicates a logic error, save the ROP and seek technical assistance.
- TIME OUT FOR RECEIVING RESULTS OF POST-BOOT CHECKS — No action is needed.
- TIME OUT RTR GROW: AIM REPORTED x, RTR REPORTED x — Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be grown. Manually, grow those units and move them to OOS through RC/V; then restore them. If the message indicates a logic error, save the ROP and seek technical assistance.
- TIME OUT SPLIT ECD: AIM REPORTED x, RTR REPORTED x — Wait for offline boot to terminate. Check the ROP for previous messages detailing what could not be split. Correct the problems and try offline boot again. If the message indicates a logic error, save the ROP and seek technical assistance.
- TIME OUT WHEN GROWING g h — To recover the units, wait for offline boot to terminate; use RC/V to move the units to GROW and then to OOS. Finally, restore the units manually.
- TRYING TO WRITE INVALID BOOTSTATUS TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID IOPMASK TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID IOPSUBUNIT TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID MODE TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID MODIFIEDECD TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID OFLTTY TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID OLBACK TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID OLBDFC TO LOW CORE — Save the ROP output and seek technical assistance.
- TRYING TO WRITE INVALID OLBTRACE TO LOW CORE — Save the ROP output and seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

TRYING TO WRITE INVALID OLBUC L TO LOW CORE — Save the ROP output and seek technical assistance.

TRYING TO WRITE INVALID ORIGSIDE TO LOW CORE — Save the ROP output and seek technical assistance.

TRYING TO WRITE INVALID VALUE TO LOW CORE — Save the ROP output and seek technical assistance.

UNEXPECTED MESSAGE FROM AIM — Save the ROP output and seek technical assistance.

UNEXPECTED MESSAGE RECEIVED FROM — Save the ROP output and seek technical assistance.

UNIT REMOVAL FAILURE — No action is needed.

### 1. FORMAT

- [1] REPT OLBCONFIG FAULT TYPE a UNIT = b PID = c LOCID = d
- [2] REPT OLBCONFIG FAULT TYPE a INACCESSIBLE RID = e PID = c  
LOCID = d

### 2. REASON FOR OUTPUT

To report a fault condition in the Error Interrupt Handler (EIH) `olbconfig` function.

Format 1 is printed whenever the name of the unit can be determined. If not, Format 2 is printed.

### 3. VARIABLE FIELD DEFINITIONS

- a One or more fault types:
- AMB — Could not allocate a message buffer.
  - CI — `olbconfig` internal failure.
  - EA — Equipment Configuration Database (ECD) access problem.
  - ED — ECD data invalid.
  - FSM — Could not fault a process or send a message to a process.
  - IA — Possible invalid argument.
  - PA — Plant measurements database access problem.
  - PS — Unit in protected state.
- b Name and number of unit.
- c Process number of the process which called the `olbconfig` function.
- d Identification number of the fault in `olbconfig`.
- e Record ID (RID) of the Unit Control Block (UCB) record in the Equipment Configuration Database (ECD) of the unit.

### 4. ACTION TO BE TAKEN

If OFLB00T is automatically terminated, run ECD audit.

## 2. REASON FOR OUTPUT

To report system performance statistics.

## 3. VARIABLE FIELD DEFINITIONS

- a      FORM
- b      Reporting office.
- c      Report interval: HOURLY, DAILY, or DAY TO HOUR.
- d      Current generic running in the reporting office.
- e      Report type: SCHEDULED, RETAINED or DEMAND.

|   |                                                                                                                                                                                                                                                                                                         |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| f | Date on which the report was generated.                                                                                                                                                                                                                                                                 |
| g | Time of day.                                                                                                                                                                                                                                                                                            |
| h | Report period: that is, date and time of the beginning and end of the accumulation period of the appropriate report.                                                                                                                                                                                    |
| i | Data validity field: YES or NO, INITIALIZED (followed by date and time of the last system initialization).                                                                                                                                                                                              |
| j | Number of alarms of the specified type.                                                                                                                                                                                                                                                                 |
| k | Number of system initializations of the specified type and level.                                                                                                                                                                                                                                       |
| l | Number of processor interrupts of the types:<br>0 — My (on-line) CC<br>1 — Other CC<br>2 — Software<br>3 — EAI<br>Type does not indicate priority level.                                                                                                                                                |
| m | Audit name.                                                                                                                                                                                                                                                                                             |
| n | Audit member number.                                                                                                                                                                                                                                                                                    |
| o | Number of audit attempts.                                                                                                                                                                                                                                                                               |
| p | Number of audit failures.                                                                                                                                                                                                                                                                               |
| q | Quantity of units of the specified type which have the plant bit set in the appropriate Unit Control Block (UCB).                                                                                                                                                                                       |
| r | Number of requests for the given unit to go to a non-active state due to an error threshold having been exceeded.                                                                                                                                                                                       |
| s | Number of transient errors.                                                                                                                                                                                                                                                                             |
| t | Number of routine automatic diagnostics.                                                                                                                                                                                                                                                                |
| u | The amount of time, in seconds, the unit is in a non-active state due to adp time.                                                                                                                                                                                                                      |
| v | The amount of time the unit is in a non-active state due to a manual request. Units that are unequipped for offline boot will be reported as non-active due to a manual request on the original on-line side. On the original off-line side, unequipped units for offline boot will not be reported on. |
| w | The amount of time the unit is in a non-active state due to an error threshold having been exceeded.                                                                                                                                                                                                    |
| x | The amount of time that the unit is forced active; valid for CU unit only.                                                                                                                                                                                                                              |
| y | Unit name.                                                                                                                                                                                                                                                                                              |
| z | Unit number.                                                                                                                                                                                                                                                                                            |

### 1. FORMAT

- [1] REPT OP PMCR ERROR abbc
- [2] REPT OP PMCR ERROR {a01c|a02c|a03c|a13c|a14c|a15c|...  
... a16c|a181|a182}[ ,ERRNO = d]
- [3] REPT OP PMCR ERROR {a04c|a05c|a06c|a07c}[ ,ERRNO = e]
- [4] REPT OP PMCR ERROR {a17c|a183}[ ,ERRNO = f]
- [5] REPT OP PMCR ERROR {a08c|a09c|a10c|a11c|a12c|a19c}[ ,ERRNO = g]

### 2. REASON FOR OUTPUT

To report errors encountered during the execution of the processes which comprise the Plant Measurements Common Report (PMCR) capability.

The error code is a four-digit number. This code consists of a one-digit number that indicates the PMCR process in which the error was detected, a two-digit number that indicates the error type, and a one-digit number that shows the location of the error within the specific process.

### 3. VARIABLE FIELD DEFINITIONS

- a Indicates the PMCR process in which the error was detected:
  - 1 — PMCR craft interface.
  - 2 — PMCR manager.
  - 3 — PMCR collector.
  - 4 — PMCR report generator.
- b Indicates the error type:
  - 01 — Could not connect to system port.
  - 02 — Could not send or receive message.
  - 03 — Failed plib call.
  - 04 — Failed pl\_init call.
  - 05 — Failed pl\_attrec call.
  - 06 — Failed pl\_update call.
  - 07 — Failed pl\_read call.
  - 08 — Failed lla\_iatt call.
  - 09 — Failed lla\_irel call.
  - 10 — Failed lla\_rdget call.
  - 11 — Failed lla\_opensq call.
  - 12 — Failed lla\_nextseq call.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 13 — Could not execute PMCR collector or PMCR report generator.
- 14 — Could not get Equipment Configuration Database (ECD) segments.
- 15 — Could not get reporting office name from ECD.
- 16 — Computation of maintenance usage time for the specified unit resulted in a time greater than 86,400 seconds (one day).
- 17 — Bad arguments received by PMCR report generator.
- 18 — Spool error during output of report.
- 19 — No data has been collected to output a retained/demand report.
- 20 — fopen UNIX® operating system call failed trying to open the /etc/pmcrtab file to initialize the hourly/daily report option flags. When this error is output, the hourly/daily report flags will be set to the default. This means that the hourly reports will be output every hour, and the daily reports at midnight.
- 21 — create UNIX® call failed trying to create the /etc/pmcrtab file. This will cause the hourly/daily report flags to be reset to the default values, if the PMCR process /prc/pmcman is re-initialized (for example, if a PHASE 2 occurs).
- 22 — PMDB initialization time reset to current time.
- 23 — Start time reset to 0.
- 24 — Start time reset to current time.
- 25 — Change reason for start time and reset start time to 0.
- 26 — Start time reset to top unit start time.
- 27 — Change reason for start time to top unit reason and reset start time to top unit start time.
- 28 — Hour limit exceeded - time reset to one hour.
- 29 — Negative time count - time reset to 0.
- 30 — Day limit exceeded - time reset to one day.
- 31 — Current value (for example, alarm count) is less than count recorded from previous hour or previous count was invalid.
- 32 — Open of /etc/log/pmcrllog file failed.
- 33 — Could not execute pmdbcopy.

**NOTE:** For messages 23 through 32, see /etc/log/pmcrllog for record name information. These error messages indicate that the count or time for the unit may not be valid. The log file (/etc/log/pmcrllog) is reset every time a scheduled report runs.

- c Location of the error within the specific process.
- d Error code returned by the failing function call, see System Error Codes Output Appendix, APP:SYSERR.
- e Plant measurements error code number.
- f Value of the bad arguments passed to the function or process.
- g Does not specify an error code.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

The table shows the action to be taken based on error code a. In all instances, seek technical assistance if the error persists.

If error code is:

- x01x — Check port 27, using the OP:STATUS;PORTS input command, to see if another process has control of the port.
- x02x — Check that the correct OP:PMCR;ERR input command was entered.
- x03x - x07x — Check the usability of the plant measurements database.
- x08x - x12x — Check the usability of the ECD.
- x13x — Check the usability of the PMCR processes.
- x14x - x15x — Check the usability of the ECD.
- x16x — Check system clock versus last clean report.
- x17x — Check that the correct OP:PMCR input command was entered.
- x18x - x32x — No action can be taken.
- x33x — Check the usability of the /prc/pmdbcopy process.

## 1. FORMAT

This message has two output formats:

- [1] REPT OP\_RTM FLT  
EFLAGS=a, FLTCODE=b
- [2] REPT OP\_RTM FLT  
EFLAGS=a, FLTCODE=b, PA=c  
R0=d, R7=e, R8=f

## 2. REASON FOR OUTPUT

The IMS realtime monitor process (op\_rtm.p) has encountered a hardware or software fault.

## 3. VARIABLE FIELD DEFINITIONS

- a Hexadecimal number which is the sum of the codes for all UNIX® RTR events outstanding for the IMS realtime monitor process. (These are defined in UNIX® RTR header file evflag.h.)
- b The UNIX® RTR fault code.
- c If this is present, then the IMS realtime monitor process was in execution at this virtual address when the fault was encountered.
- d Contents of 3B CU register r0.
- e Contents of 3B CU register r7.
- f Contents of 3B CU register r8.

## 4. ACTION TO BE TAKEN

Analyze the fault code (See Output Appendix APP: FAULT-CODE).

If the fault is not attributed to a hardware problem, seek technical assistance.

- [1] REPT OTHER STORE HARDWARE ERROR X'a
- [2] REPT OTHER STORE READ DATA PARITY ERROR X'a
- [3] REPT OTHER STORE REFRESH PARITY ERROR X'a

## 2. REASON FOR OUTPUT

To report memory hardware errors in the standby CU. The CU must be in the STBY state for these messages to appear.

## 3. VARIABLE FIELD DEFINITIONS

- a The error message sequence number. This sequence number corresponds to the sequence number of the associated REPT CU n ERROR INTERRUPT message, where n is 0 or 1.

## 4. ACTION TO BE TAKEN

Refer to the Error Analysis section of the CIC Select Code 304-046 *3B20D and 3B21D Computers UNIX® RTR Operating System System Maintenance Manual*

## 1. FORMAT

REPT OTHER STORE HARDWARE ERROR X'a  
ONLINE CU: b  
FAULTY UNIT: c d e f  
TIME OF ERROR: g  
MAIN STORE CONTROLLER 0  
TRAPPED ADDRESS REGISTER: hhhhhhhh  
ERROR REGISTER 1: iiiiiiii  
ERROR REGISTER 2: jjjjjjjj  
MAIN STORE CONTROLLER 1 (MAY NOT BE CONFIGURED)  
TRAPPED ADDRESS REGISTER: kkkkkkkk  
ERROR REGISTER 1: llllllll  
ERROR REGISTER 2: mmmmmmmm  
REAL TIME CLOCK: nnnnnnnn

## 2. REASON FOR OUTPUT

These errors occur in the off-line Control Unit (CU), but are detected by the on-line CU.

The OTHER STORE HARDWARE ERROR occurs because the memory controller of the mate processor has a store error A condition.

## 3. VARIABLE FIELD DEFINITIONS

## 1. FORMAT

REPT OTHER STORE READ PARITY ERROR X'a  
ONLINE CU: b  
FAULTY UNIT: c d e f  
TIME OF ERROR: g  
MAIN STORE CONTROLLER 0  
TRAPPED ADDRESS REGISTER: hhhhhhhh  
ERROR REGISTER 1: iiiiii  
ERROR REGISTER 2: jjjjjj  
MAIN STORE CONTROLLER 1 (MAY NOT BE CONFIGURED)  
TRAPPED ADDRESS REGISTER: kkkkkkkk  
ERROR REGISTER 1: llllllll  
ERROR REGISTER 2: mmmmmmm  
ERROR DATA: nnnnnnnn  
PHYSICAL MEMORY ADDRESS: ooooooooo  
REAL TIME CLOCK: pppppppp

## 2. REASON FOR OUTPUT

These errors occur in the off-line Control Unit (CU), but are detected by the on-line CU.

The READ DATA PARITY ERROR indicates a noncorrectable memory error (other store C) in the mate processor. This type of error can only occur if the mate processor is in the standby state.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                              |

## 1. FORMAT

REPT OTHER STORE REFRESH PARITY ERROR X'a  
ONLINE CU: b  
FAULTY UNIT: c d e f  
TIME OF ERROR: g  
MAIN STORE CONTROLLER 0  
TRAPPED ADDRESS REGISTER: hhhhhhhh  
ERROR REGISTER 1: iiiiii  
ERROR REGISTER 2: jjjjjj  
MAIN STORE CONTROLLER 1 (MAY NOT BE CONFIGURED)  
TRAPPED ADDRESS REGISTER: kkkkkkkk  
ERROR REGISTER 1: llllllll  
ERROR REGISTER 2: mmmmmmm  
ERROR DATA: nnnnnnn  
PHYSICAL MEMORY ADDRESS: ooooooooo  
REAL TIME CLOCK: pppppppp

## 2. REASON FOR OUTPUT

These errors occur in the off-line Control Unit (CU), but are detected by the on-line CU.

The REFRESH PARITY ERROR indicates a correctable parity error (other store D) in the mate processor. This type of error can only occur if the mate processor is in the standby state.

## 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                              |
|---|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a | Sequence hexadecimal number associating this report with previous REPT-CU (see its parameter d).                                                             |

ID ..... REPT:OVLD-CNTL  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT OVLD CONTROL: a

## 2. REASON FOR OUTPUT

To report that the overload system is initialized or that the control process cannot execute the overload collection process or overload report process. This message reflects the status of the overload measurement system process that controls access to the data file which stores overload data.

## 3. VARIABLE FIELD DEFINITIONS

a                      Message code:

- 1 — Cannot execute overload collector process.
- 2 — Cannot execute overload report process.
- 3 — Overload system initialized.

## 4. ACTION TO BE TAKEN

Determine whether the overload collector (/prc/ovldcoll) process and/or the overload report (/prc/ovldrpt) process exist and are executable.

## 5. REFERENCES

Output Message  
REPT:OVLD-REPT

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:OVLD-COLL  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT OVLD COLLECT: a[,bb]

## 2. REASON FOR OUTPUT

To report any errors that occur while reading or updating the protected application segment of the overload measurements collection process. The overload measurements collection process reads raw counts supplied by application integrity monitor (AIM) on the hour and updates the last hour, day-to-hour, and daily counts.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Message code:
- 1 — Cannot open overload data file.
  - 2 — Cannot write overload data file.
  - 3 — Cannot execute overload update process.
  - 4 — Cannot attach to protected application segment with raw overload counts.
  - 11 — Write error on overload measurement data base.
  - 13 — 3B DMERT system message error or /prc/ovldcntl not on port 81.
- b                      3B DMERT processor system error code:
- 11 — System process table.
  - 12 — Not enough core to execute a process.
  - 13 — Permission denied to access a file.
  - 23 — File table overflow.
  - 28 — No free space is left on device.

## 4. ACTION TO BE TAKEN

If a = 3, check the existence and execution permission of the update overload process (/prc/ovldupdt).

If a = 13, do OP:STATUS:PROCESS,ALL and check for multiple occurrences of /etc/ularp. Also check to see that port 81 is connected to process /prc/ovldcntl. Get port assignments using OP:STATUS:PORTS and sysports.h.

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT OVLD REPORT:a

## 2. REASON FOR OUTPUT

To report that the overload counts are unavailable, lost, or invalid. The overload counts are stored in the overload data file, which is determined by reading raw counts supplied by the application integrity monitor (AIM).

## 3. VARIABLE FIELD DEFINITIONS

a                      Error code:

- 1 — Overload data file not accessible.
- 2 — Data in overload data file not valid.

## 4. ACTION TO BE TAKEN

None. Overload system is self-correcting.

ID ..... REPT:PCPAUD  
WORK CENTER.. MOC  
GENERIC ..... 4AP17 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT PCPAUD FAULT TYPE a ASSERT = 0x4002
- [2] REPT PCPAUD FAULT TYPE b ASSERT = {0x3b02|0x3b03}
- [3] REPT PCPAUD FAULT TYPE c ASSERT = {d|e}

## 2. REASON FOR OUTPUT

Report errors detected during the Control Unit (CU) administrative sequences of the Processor Control Process Audit (PCPAUD) process, or to report errors in calling the PCPAUD process or internal logic errors within the PCPAUD process.

## 3. VARIABLE FIELD DEFINITIONS

- a Type of fault found. PCPAUD was faulted. See output Fault Code Appendix, APP:FAULT-CODE, for fault-type information.
- b Type of fault found. The character n refers to the hexadecimal value of the MHD number of the MHD being audited.
  - 0xc001000n — Call to lla\_rdget failed. Unable to get the MHD UCB for the MHD number in field n.
  - 0xc002000n — Call to lla\_rdget failed. Unable to get the SBUS UCB for the MHD number in field n.
  - 0xc003000n — Call to lla\_rdget failed. Unable to get the DFC UCB for the MHD number in field n.
  - 0xc004000n — Call to lla\_rdget failed. Unable to get the SBUS UCB for the MHD number in field n.
  - 0xc005000n — The SBUS device ID for MHD n did not match that in the SBUS UCB.
  - 0xc006000n — Call to lla\_rdget failed. Unable to get the MHD UCB for the MHD number in field n.
  - 0xc007000n — The MHD device ID for MHD n did not match that in the MHD UCB.
  - 0xc008000n — The unit number in the MHD ucb did not match MHD n.
- c Type of fault found:
  - 0x0 — Field unused. Refer to assert number for description of problem.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x2 — Bad data in Equipment Configuration Database (ECD) for a Control Unit (CU) or subunit.
- 0x4 — Could not access the ECD - possibly a bad Record ID (RID).
- 0x6 — Maintenance channel failed.
- 0xA — A call to the KCONFIG library failed.
- 0xC — Erroneous major state for a CU unit or subunit.
- 0xE — Bad on-line System Status Register (SSR) value.
- 0x10 — Bad off-line SSR value.
- 0x12 — Bad on-line Hardware Status Register (HSR) value.
- 0x14 — Bad off-line HSR value.
- 0x18 — Plant measurement library call failed.
- 0x1a — Audit control library call failed.
- 0x1c — Internal CUMEM or CUSTAT audit error.
- 0x1e — Off-line store access failed.
- 0x20 — Memory audit internal error.
- 0x28 — Failure to allocate or queue message.
- 0x2a — Emergency Action Interface (EAI) buffers data mismatch.
- 0x2c — SSR values inconsistent between CUs.
- 0x2d — Failure to attach to ECD or to get ECDORG data.
- 0x2e — Failure is related to pcreating another process.
- 0x2f — Timeout error.

d

Assert number associated with the specific cause of the error. Assert numbers 0x3000 to 0x3fff report an error detected during the CU administrative sequences of the PCPAUD process.

- 0x3000 — RID for on-line CU is IDNULL.
- 0x3001 — Call to ECD `lla_rdget` to get on-line CU UCB unsuccessful.
- 0x3002 — On-line CU UCB `u_dtype` (device type) not DEV\_CU.
- 0x3003 — RID for off-line CU is the same as RID for on-line CU.
- 0x3004 — Call to ECD `lla_rdget` to get off-line CU UCB unsuccessful.
- 0x3005 — Off-line CU UCB `u_dtype` (device type) not DEV\_CU.
- 0x3006 — Call to ECD `lla_rdget` to get on-line CU Minor Device Chain Table (MDCT) unsuccessful.
- 0x3007 — MDCT for the on-line CU has too many `m_minxt` entries. This would indicate that there are more than two CUs.
- 0x3008 — MDCT for the on-line CU has too many `m_minxt` entries. This would indicate that there are more than two CUs.
- 0x3009 — MDCT `m_minxt[0]` equals `m_minxt[1]` indicating that CU0 and CU1 have the same RIDs.
- 0x300a — MDCT `m_minxt[0]` does not equal the RID for the on-line or off-line CU.
- 0x300b — MDCT `m_minxt[1]` does not equal the RID for the on-line or off-line CU.
- 0x300c — Call to `lla_rdget` to read in new ECD org structure unsuccessful. Will continue to use preceding ECD org data.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x3100 — Maintenance Channel (MCH) and update circuit not functional; but other CU UCB u\_stat is Standby (STBY).  
0x3101 — Call to kconfig fltdrvr to remove other CU unsuccessful.  
0x3102 — Call to kconfig chgstate to change off-line CU UCB u\_stat to UNAV unsuccessful.  
0x3104 — Call to kconfig chgstate to change off-line CU UCB u\_stat to UNAV unsuccessful.  
0x3105 — Call to ECD lla\_rdget to get off-line CU UCB unsuccessful.  
0x3107 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to ON unsuccessful.  
0x3108 — Call to kconfig chgstate to change off-line CU UCB u\_stat to OOS unsuccessful.  
0x3109 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to OFF unsuccessful.  
0x310a — Call to ECD lla\_rdget to get off-line CU UCB unsuccessful.  
0x3201 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to ON unsuccessful.  
0x3202 — Call to kconfig fltdrvr to remove other CU unsuccessful.  
0x3203 — Call to kconfig chgstate to change off-line CU UCB u\_stat to UNAV unsuccessful.  
0x3204 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to OFF unsuccessful.  
0x3206 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to ON unsuccessful.  
0x3207 — Call to kconfig chgstate to change off-line CU UCB u\_stat to UNAV unsuccessful.  
0x3208 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to OFF unsuccessful.  
0x3209 — Call to ECD lla\_rdget to get off-line CU UCB unsuccessful.  
0x320a — Call to ECD lla\_rdget to get on-line CU UCB unsuccessful.  
0x320b — Call to ECD lla\_uprid to change on-line CU UCB unsuccessful.  
0x320c — Call to plant measurements unsuccessful (PL\_RDGET\_ERROR).  
0x320d — Call to plant measurements unsuccessful (PL\_RCRT\_ERROR).  
0x320f — Call to ECD chucb to change off-line CU UCBs u\_manrqst to ON unsuccessful.  
0x3210 — Call to kconfig chgstate to change off-line CU UCB u\_stat to OOS unsuccessful.  
0x3211 — Call to ECD chucb to change off-line CU UCBs u\_manrqst to OFF unsuccessful.  
0x3212 — Call to ECD lla\_rdget to get off-line CU UCB unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x3213 — Call to ECD `lla_rdget` to get on-line CU UCB unsuccessful.
- 0x3214 — Call to ECD `lla_uprid` to change on-line CU UCB unsuccessful.
- 0x3215 — Call to plant measurements unsuccessful (PL\_RDGET\_ERROR).
- 0x3216 — Call to plant measurements unsuccessful (PL\_RCRT\_ERROR).
- 0x3217 — Call to ECD `lla_rdget` to get off-line CU UCB unsuccessful.
- 0x3218 — Call to ECD `lla_uprid` to change off-line CU UCB unsuccessful.
- 0x3300 — Call to `clrisc` to clear off-line CU Initialization Sequence Control (ISC) bits unsuccessful (System Status Register [SSR] bits 4 and 5 - SSR\_ISC0 and SSR\_ISC1).
- 0x3402 — Call to ECD `lla_rdget` to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
- 0x3403 — Call to ECD `lla_uprid` to change on-line CU CSU 0 UCB `u_bypass` to ON unsuccessful.
- 0x3404 — Call to ECD `lla_rdget` to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
- 0x3405 — Call to ECD `lla_uprid` to change off-line CU CSU 0 UCB `u_bypass` to ON unsuccessful.
- 0x3406 — Call to ECD `lla_rdget` to get on-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for on-line CU.
- 0x3407 — Call to ECD `lla_uprid` to change on-line CU CSU 0 UCB `u_bypass` to OFF unsuccessful.
- 0x3408 — Call to ECD `lla_rdget` to get off-line CU CSU 0 UCB unsuccessful; possibly bad cache RID for off-line CU.
- 0x3409 — Call to ECD `lla_uprid` to change off-line CU CSU 0 UCB `u_bypass` to OFF unsuccessful.
- 0x340a — Call to ECD `lla_rdget` to get boot device 0 UCB unsuccessful; possibly bad `bdev0` RID.
- 0x340b — Call to ECD `lla_rdget` to get boot device 1 UCB unsuccessful; possibly bad `bdev1` RID.
- 0x340d — Call to PCPAUD `scoflfbd` unsuccessful; possibly bad communications to off-line CU. `scoflfbd` adjusts off-line CU SSR force boot device bits (SSR\_FBF and SSR\_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
- 0x340e — Call to PCPAUD `scoflfbd` unsuccessful; possibly bad communications to off-line CU. `scoflfbd` adjusts off-line CU SSR force boot device bits (SSR\_FBF and SSR\_FBDS, bits 6 and 7) to select the active boot device, if not forced by EAI.
- 0x3500 — Call to PCPAUD `syncrtc` unsuccessful; possibly bad communications to off-line CU. `syncrtc` reads the on-line CU Real Time Clock (RTC) and writes it to the off-line CU RTC.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x3501 — Call to PCPAUD `coflpso` unsuccessful; possibly bad communications to off-line CU. `coflpso` reads and clears the periodic scanned options in the off-line CU EAL.
- 0x3702 — Off-line CU is in enable update mode (SSR\_UPD bit 19 asserted) or off-line CU is isolating its main store bus from the on-line CU (SSR\_ISOUI bit 21 asserted in the off-line CU).
- 0x3703 — Call to PCPAUD `initofl` to initialize off-line CU unsuccessful; possibly bad communications to off-line CU. `initofl` initializes the MCH in the on-line and off-line CUs, and executes the initialization microcode in the off-line CU.
- 0x3704 — Call to `kconfig fltdrvr` to remove other CU unsuccessful.
- 0x3705 — Off-line CU UCB `u_stat` is Standby (STBY), but off-line CU UCB `u_update` is OFF (not updated) or on-line CU SSR is not in enable update mode (SSR\_UPD bit 19 not asserted).
- 0x3706 — Call to `kconfig fltdrvr` to remove other CU unsuccessful.
- 0x3707 — On-line CU not in enable update mode (SSR\_UPD bit 19 not asserted), but off-line CU UCB `u_update` is ON (updated).
- 0x3708 — Call to ECD `chucb` to change off-line CU UCBs `u_update` to NO unsuccessful.
- 0x3709 — Call to `kconfig fltdrvr` to remove other CU unsuccessful.
- 0x370a — On-line CU SSR not isolating other (off-line) CU from its main store bus (SSR\_ISOUI bit 21 not asserted).
- 0x3901 — Call to ECD `chucb` to change off-line CU UCBs `u_manrqst` to ON unsuccessful.
- 0x3902 — Call to `kconfig chgstate` to change off-line CU UCB `u_stat` to OOS unsuccessful.
- 0x3903 — Call to ECD `chucb` to change off-line CU UCBs `u_manrqst` to OFF unsuccessful.
- 0x3904 — Call to ECD `lla_rdget` to get off-line CU UCB unsuccessful.
- 0x3b01 — Call to PCPAUD `send_pm` function failed. Unable to `pcreate bootdiskchk` process.
- 0x3b02 — Error found in PCPAUD `admseq11` audit of the DFC 0 side Alternate Boot Disk (ABD)
- 0x3b03 — Error found in PCPAUD `admseq11` audit of the DFC 1 side Alternate Boot Disk (ABD)
- 0x3b04 — Call to PCPAUD `send_pm` function failed. Unable to `pcreate bootdiskchk` process.

e The following errors are errors found in calling the PCPAUD process or internal logic errors within the PCPAUD process. They cannot be reported via the audit control library (ACL) and otherwise do not fit any of the other categories.

SEE PROPRIETARY NOTICE ON COVER PAGE

0x4000 — Call to ACL aud\_minit unsuccessful.  
0x4001 — Call to ACL aud\_finis unsuccessful.  
0x4003 — Call to ACL aud\_finis unsuccessful.  
0x4004 — Call to ACL aud\_error unsuccessful.  
0x4005 — Call to ACL aud\_finis unsuccessful.  
0x4006 — Call to ACL aud\_finis unsuccessful.  
0x4007 — Call to ACL aud\_finis unsuccessful.  
0x4008 — Call to ACL aud\_finis unsuccessful.  
0x4009 — Call to ACL aud\_finis unsuccessful.  
0x400a — Neither CUSTAT or CUMEM was selected when PCPAUD was called to run an audit.  
0x400b — Call to ECD lla\_rdget unsuccessful.  
0x400c — CUSTAT memory compare starting address is not on a full word boundary (internal error).  
0x400d — Call to PCPAUD memtst did not complete successfully (internal error).  
0x400e — Call to PCPAUD memtst did not complete successfully (internal error).  
0x400f — Call to PCPAUD memtst did not complete successfully (internal error).  
0x4010 — CUMEM starting address is not on a full word boundary (internal error).  
0x4011 — Call to PCPAUD memtst did not complete successfully (internal error).  
0x4012 — PCPAUD has been unsuccessful in executing its event entry at least 8 times, or Call to queuemn unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.  
0x4013 — PCPAUD has been unsuccessful in executing its fault entry at least 5 times.  
0x4014 — Call to queuemn unsuccessful (system error). PCPAUD could not return the PSM message to PSM after CU power-up initialization delay.  
0x4015 — Call to queuemn unsuccessful (system error). PCPAUD could not return the PSM message to PSM for false CU power-up.  
0x4016 — Call to ACL aud\_finis unsuccessful.  
0x4017 — PCPAUD received an OST of a type not processed by PCPAUD. Variable a in the output message will contain the OST value.  
0x4018 — Call to lla\_iatt unsuccessful (system error).  
0x4019 — Call to lla\_rdget unsuccessful (system error). Unable to read new ECD org structure.  
0x401a — Call to kgetabdst unsuccessful (system error).  
0x401b — Call to create a process was unsuccessful.  
0x401c — PCPAUD received a message from a non-existent process.  
0x401d — Call to lla\_iatt unsuccessful (system error).  
0x401e — Call to lla\_rdget unsuccessful (system error). Unable to read new ECD org structure.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x401f — Call to allocmsg unsuccessful (system error). PCPAUD could not allocate space for the message to terminate the bootdiskchk process.
- 0x4020 — Call to queuefn unsuccessful (system error). PCPAUD could not queue the message to terminate the bootdiskchk process.
- 0x4021 — Exceeded the maximum number of create attempts to start the bootdiskchk process.
- 0x4022 — Timed out while waiting for results from the bootdiskchk process.
- 0x4023 — Call to lla\_rdget unsuccessful (system error). Unable to read ECD btparm structure used with REPT ECD report.

#### 4. ACTION TO BE TAKEN

Some of the faults reported will be corrected by PCPAUD. For others, manual actions are required to correct the problem. The list contains some actions to specific fault type codes. If the message persists, contact your next level of technical assistance.

- 0x4, 0x2d — Run ECD 1 audit.
- 0x6 — Check maintenance channel cable. Run CU diagnostics on the off-line CU. The problem could also be in the on-line CU maintenance channel. Switch CUs, run CU diagnostics. The problem is serious and should be taken care of as soon as possible.
- 0xe — Take action on this error only if it occurs repeatedly. Switch CUs, run CU diagnostics.
- 0x10 — Take action on this error only if it occurs repeatedly. Run CU diagnostics.
- 0x12 — Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited on-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
- 0x14 — Take action on this error only if it occurs repeatedly. Either CU could cause bad value in the audited off-line HSR bits. Run CU diagnostics, switch CUs, run CU diagnostics.
- 0x18 — Run Plant Measurements System (PMS) 1 audit.
- 0x1e — Run CU diagnostics, switch CUs, run CU diagnostics.
- 0x2a — Clear the EAls with a poke 14 on the EAI page of the MTTY. Take further action on this error only if it occurs repeatedly. Run CU diagnostics, switch CUs, run CU diagnostics.
- 0x2c — Take action on this error only if it occurs repeatedly. Either CU could cause inconsistent values between the SSRs. Run CU diagnostics, switch CUs, run CU diagnostics.

ID ..... REPT:PCPMD  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT PCPMD FAULT TYPE a UNIT = b ASSERT = c
- [2] REPT PCPMD FAULT TYPE a INACCESSIBLE RID = d ASSERT = c

## 2. REASON FOR OUTPUT

To report an error condition in the processor control Processor Control Process Maintenance Driver (PCPMD).

Format 1 is printed whenever the name of the unit can be determined.

Format 2 is printed whenever the name of the unit cannot be determined.

## 3. VARIABLE FIELD DEFINITIONS

- a Fault type codes:
- BOFL — Maintenance Channel (MCH) buffer overflow.
  - ECDA — Equipment Configuration Database (ECD) access problem.
  - EMCH — Incorrect number of MCH orders executed.
  - EONL — Bad return from on-line diagnostic.
  - ESIM — Could not fault System Integrity Monitor (SIM).
  - IARG — Invalid argument.
  - IDCP — PCPMD internal error.
  - SPRC — Slave processor.
  - WAKE — Supervisor wakeup failed.
- b Unit name.
- c Identification number (ASSERT number) of the fault in PCPMD.
- d Record ID (RID) of the Unit Control Block (UCB) record in the ECD.

## 4. ACTION TO BE TAKEN

Consider bootstrapping for fault type ECDA. For other cases, save a copy of the output message and seek technical assistance.

ID ..... REPT:PLDMON  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

This message has two formats.

[1] REPT PLDMON ERROR a ERRNO b

[2] REPT PLDMON ERROR a UNIT c d

## 2. REASON FOR OUTPUT

To report errors discovered by PLDMON while attempting to update the 3B20D computer Plant Measurements System (PMS) database.

## 3. VARIABLE FIELD DEFINITIONS

- a One of the following error codes:
- 1 — Cannot initialize PMS database.
  - 2 — Cannot update setid record.
  - 3 — Cannot read maintenance usage records.
  - 4 — Cannot attach to maintenance usage record.
  - 5 — Cannot update maintenance usage record.
  - 6 — Ptimer call failed.
  - 7 — Negative maintenance usage time found for the unit named.
  - 8 — Cannot allocate message buffer for scheduling hourly report.
  - 9 — Cannot get process ID for PMCR port.
  - 10 — Cannot queue message for scheduling hourly report.
  - 11 — Unknown fault message buffer released.
- b Error type returned for technical evaluation. Seek technical assistance for interpretation.
- c Unit name.
- d Unit number.

## 4. ACTION TO BE TAKEN

For error codes 1-5 and 7, check the usability of the PMS database. For error code 6, PLDMON will not run again until a system phase occurs. Seek technical assistance. For error code 7, a negative maintenance usage time is found because of a change in the system clock. PLDMON will not record that time and the start time for that unit in the database will be set to the current time. This message is to warn that a discrepancy might be reflected for that unit in the daily and hourly OP:PMCR report. Error codes 8 - 10 indicate a problem with pldmon sending a message to PMCRMAN to collect data (PMCRCOL), copy incore PMS database to disk (PMDBCOPY) and run hourly scheduled reports. These may be manually invoked. Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

Error code 11 indicates that a fault message other than a message and fault was found and removed. Seek technical assistance.

## 1. FORMAT

[1] REPT PLDMON ERROR a ERRNO b

[2] REPT PLDMON ERROR a UNIT c d

## 2. REASON FOR OUTPUT

To report errors discovered by `pldmon` while attempting to update the Plant Measurements System (PMS) database.

## 3. VARIABLE FIELD DEFINITIONS

- a Error codes:
- 1 — Cannot initialize PMS database.
  - 2 — Cannot update `setid` record.
  - 3 — Cannot read maintenance usage records.
  - 4 — Cannot attach to maintenance usage record.
  - 5 — Cannot update maintenance usage record.
  - 6 — `ptimer` call failed.
  - 7 — Negative maintenance usage time found for the Out Of Service (OOS) unit named, or the plant database record for the OOS unit named was updated more than 15 minutes ago.
  - 8 — Cannot allocate message buffer for scheduling hourly report.
  - 9 — Cannot get process Identification (ID) for Plant Measurements Common Report (PMCR) port.
  - 10 — Cannot queue message for scheduling hourly report.
  - 11 — Unknown fault message buffer released.
- b Error type returned for technical evaluation. Seek technical assistance for interpretation.
- c Unit name.
- d Unit number.

## 4. ACTION TO BE TAKEN

For error codes 1 through 5, check the usability of the PMS database.

For error code 6, PLDMON will not run again until a system phase occurs. Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

For error code 7, if the error is printed due to a negative maintenance usage time for an OOS unit, it may be because of a change in the system clock. The start time for that unit in the database will be set to the current time. No action is needed. The error message is printed to warn that a discrepancy might be reflected for that unit in the daily and hourly OP:PMCR report.

This error code may also print due to an OOS unit record in the plant database not being updated for more than 15 minutes. Upon a boot and every quarter hour (4:15, 4:30, 4:45, for example) pldmon audits the database to ensure that records for OOS units have been updated every 15 minutes. When the system boots, a copy of the plant database is copied from the disk into memory. If the database on disk has a timestamp more than 15 minutes older than the system clock at boot time, pldmon assumes that records for OOS units have not been updated for more than 15 minutes and the error will print out. The incore database is copied to disk once an hour on the hour. You should not see this error message again if you do not plan to boot before the top of the hour. If you do plan to boot before the top of the hour and do not want to see this error message, you can copy the incore database to disk by executing /prc/pmdbcopy from the UNIX® shell.

For error codes 8, 9, and 10 a problem exists with pldmon sending a message to pmcrman to collect data (pmcrcol). Copy the incore PMS database to disk via the /prc/pmdbcopy UNIX® shell command and manually run the scheduled hourly reports. If the error persists, seek technical assistance.

For error code 11, an unknown fault message (other than a message buffer audit fault) was found and removed from the buffer. If the error persists, seek technical assistance.

## 1. FORMAT

REPT PM CONTROL: a

## 2. REASON FOR OUTPUT

To report that the plant measurements (PM) system control process cannot initiate the system, execute the collection process, or execute the report process for the common plant measurements data base.

## 3. VARIABLE FIELD DEFINITIONS

a                      Error code:

- 1 — Cannot execute plant measurement collector process.
- 2 — Cannot execute plant measurement report process.
- 3 — Plant measurement system initialized.

## 4. ACTION TO BE TAKEN

Check the collection process (/prc/coll) and/or the report process (/prc/report) to determine whether they exist and are executable.

## 1. FORMAT

REPT PM REPORT:a

## 2. REASON FOR OUTPUT

To report that the plant measurements report cannot be output because the raw counts are unavailable, invalid, or not accessible. The plant measurements data base is determined by comparing raw 3B DMERT processor system counts.

## 3. VARIABLE FIELD DEFINITIONS

a                      Error code:  
  
                        1 — Plant measurement data base not accessible.  
                        2 — Data in plant measurement data base not valid.

## 4. ACTION TO BE TAKEN

None. Plant measurement system is self-correcting.

TYPE ..... Output

## 1. FORMAT

- [1] REPT PMDBCOPY ERROR a [ERRNO = b]
- [2] REPT PMDBCOPY NO COPY
- [3] REPT PMDBCOPY COMPLETED

## 2. REASON FOR OUTPUT

To report the status of the Plant Measurements System (PMS) database copy program.

Format 1 is printed when errors are found.

Format 2 indicates that the PMS database audit program is conducting corrective action on the database and, therefore, the database will not be copied to disk.

Format 3 is printed if "-p" option is specified. As a default, the message is not printed at the end of the report.

## 3. VARIABLE FIELD DEFINITIONS

- a Error type:
- 1 — Failed plib function call.
  - 2 — Could not attach to PMS database.
  - 3 — Could not initialize lla\_audit routines.
  - 4 — Error detected by the lla\_audit function.
  - 5 — Error detected by the lla\_audit function.
  - 6 — Unknown return from lla\_audit function.
  - 7 — Could not get setid record from PMS database.
  - 8 — Could not open secondary disk copy of PMS database.
  - 9 — Could not write incore PMS database to secondary disk database.
  - 10 — Could not release.
  - 11 — Request to audit the PMS database did not complete successfully. The incore database will not be copied.
  - 12 — After the incore database was copied to disk, an audit on the disk database failed. (See additional errors.) The secondary disk database may be bad.
  - 13 — The primary disk database does not exist. Attempt to move the secondary copy to primary failed. Run AUD:PMS 1.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 14 — Attempt to switch primary and secondary disk databases failed. The primary may be bad. Run AUD:PMS 1.
- 16 — falloc failed to create a contiguous file for PMS disk database.
- 17 — makeseg failed to create a temporary segment for the incore database.

b                      Number of errors detected by audit. Error types 2, 3, 7, 10 through 14, and 16, do not report an error number.

#### **4. ACTION TO BE TAKEN**

For Format 1, seek technical assistance.

For Formats 2 and 3, no action is needed.

## 2. REASON FOR OUTPUT

To report Process Manager (PMGR) related software errors. The errors are detected during the creation and termination of a supervisor or a kernel process or during a field update to a shared library.

The message identifies the type of problem encountered. There are two error types:

Failure — Causes the termination of the process under creation.

Warning — Notifies the user of the problem but does not terminate the process under creation.

## 3. VARIABLE FIELD DEFINITIONS

|               |                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------|
| ERROR 51      | Message type not recognized.                                                                                                     |
| a             | Process number of the process sending an unknown message fielded by the process manager mainline routine, in decimal notation.   |
| NUB START     | Could not recognize the type of message in START routine. Check the type of message dispatched to the NUB.                       |
| b             | Type of message received by the PMGR.                                                                                            |
| INIT          | Process manager received a second initialization message.                                                                        |
| c             | Process number of message sender.                                                                                                |
| CREATDFILE    | Pathname is not specified to create a dump file. Check the pathname in termhdr.h message.                                        |
| d             | User supplied pathname in the termhdr.h message, or NULL.                                                                        |
| ERROR 53      | Library file does not exist.                                                                                                     |
| LMAKSEG OPEN  | Could not open library file for read. Check the pathname. Could be an Input/Output failure.                                      |
| LMAKSEG MAGIC | Shared library file had incorrect magic number. Check the path name; could be an Input/Output failure.                           |
| e             | Pathname of the library file from pheader file.                                                                                  |
| ERROR 54      |                                                                                                                                  |
| MAKEKP        | Failed to create a DCTE entry during kernel process creation. Check the DCTE table; it could be full. This is a failure message. |
| MAKSUPER      | Failed to create a DCTE entry during creation of supervisor process. Check the DCTE entry table. This is a failure message.      |
| f             | Process pathname; process will not be created.                                                                                   |

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 55            Failure to load a kernel process because of insufficient memory.

MAKSEG            Failed to lock the requested segment in the memory.

g                   Process pathname; process will not be created.

ERROR 56

h                   Failure messages:

                    FILCOPY OPENADD - Segment ID is invalid or unallocated, or the  
                                         segment index in segment flags of the segment list is out of  
                                         range. Core dump will not be created.

                    SEGREAD SHARE - Sgetmodule() failed on a segment shared via  
                                         "share" ldp option.

                    All Segment Descriptor Entries (SDEs) are allocated or there is no swap  
                                         space left.

CDUMP ACTIVSEG   Cannot find the segment in the segment table. Either the segment  
                                         index is bad, or the segment points to a null segment. Core dump will  
                                         not be created. This is a failure message.

CDUMP ALOCSEG    PMGR requested the memory manager to allocate a segment. Memory  
                                         manager returned failure condition. Either there is no space left on the  
                                         disk to create this segment, or the SDE table is full. Core dump will not  
                                         be created. This is a failure message.

j                   Process number; process is terminated.

INMEM ACTIVSEG   Same as MAKPRC ACTIVSEG, except error occurred during field  
                                         update of shared library. This is a failure message.

INMEM ALOCSEG    Same as MAKPRC ALOCSEG, except error occurred during field update  
                                         of shared library. This is a failure message.

l                   Library pathname, library will not be locked.

MAKPRC ACTIVSEG   Cannot find the segment in the segment table. Segment points to a  
                                         null segment: failed to make the segment nonswap process. Segment  
                                         index out of range. This is a failure message.

NDUP ACTIVSEG    See MAKPRC ACTIVSEG. This is a failure message.

NDUP ADDSEG       See MAKPRC ACTIVSEG. This is a failure message.

SEGREAD ACTIVSEG See MAKPRC ACTIVSEG. This is a failure message.

MAKPRC ALOCSEG   PMGR made an alocseg ost call to the memory manager. Call  
                                         returned with failure condition. Either there is no space left on the  
                                         swap area, or the SDE table is full. Check the SDE table entries and the  
                                         swap space. This is a failure message.

k                   Process pathname; process will not be created.

NDUP ALOCSEG    See MAKPRC ALOCSEG. This is a failure message.

SEE PROPRIETARY NOTICE ON COVER PAGE

SEGADD ALOCSEG See MAKPRC ALOCSEG. This is a failure message.

i Segment name.

SEGADD ALOCSEGA See MAKPRC ALOCSEG. This is a failure message.

ERROR 57 Unable to read a pfile or library file.

MAKPRC Failed to read pfile header. This is a failure message.

m Process pathname; process will not be created.

LMAKSEG Failed to read library file from the disk.

n Library pathname; process will not be created.

SEGREAD Failed to read a segment from the disk.

INMEM Failed to read library file header from the disk.

o Library pathname; process will not be locked.

ERROR 58 Segment too big for virtual address space available.

p Failure messages:

DOKPSEGS - The process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511).

NUBDOSPSEGS - The process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511). This error is from the NUB process.

NUBMAKSEG - The process may need more than the number of segments specified in the process' specification file (minimum and default: 50; maximum: 511). Check segment map in the pheader file. This error is from the NUB process.

q Process pathname; process will not be created.

ERROR 59 Cannot add a shared segment to the process.

r Failure messages:

CHKSHARE EMM - extended main memory is enabled, and segment name is requested for wrong physical module.

INIT ECDDATA - Failed to open equipment configuration database data segment.

SEE PROPRIETARY NOTICE ON COVER PAGE

SEE PROPRIETARY NOTICE ON COVER PAGE

ERROR 62            Cannot acquire a Process Control Block (PCB) of a terminating process.  
MAKDUMP KERNEL    Failed to add kernel process PCB segment to the PMGR address  
                         space.  
MAKDUMP SUPER    Failed to add user process PCB segment to PMGR address space.  
w                    The process number of process being dumped, core dump will not be  
                         created.

ERROR 63            Process Manager (PMGR) faulted, entered fault routine.  
ERROR 64            NUB faulted, entered fault routine.  
x                    Eight digit hexadecimal number. The two high order digits are the  
                         fault code. The remaining six digits, if present, are the program  
                         address at fault. If they are missing, the fault was externally generated.  
y                    Process or library pathname; process will not be created or library will  
                         not be locked.

ERROR 67            Bad acknowledgment resulting from copyseg Operating System Trap  
                         (OST).  
z                    Failure messages:  
                         MAKSUPER PFILE - Failed to copy pfile header to the NUB's address  
                         space.  
                         NDUP COPYSEG - Failed to copy NUB segment into NUB address space.  
                         NDUP FWAIT - Received a failure state after copyseg operation.  
a1                   Process pathname; process will not be created.

ERROR 68            Pfile (LDP output) doesn't exist, or does not have correct magic  
                         number, or wrong supervisor or kernel mode.  
b1                   Process number, in decimal notation. The pfile specified in a pcreate  
                         request by process listed could not be opened.  
c1                   Status returned from file manager.  
d1                   Pathname of the pfile which could not be opened.  
MAKPRC BADMAGIC    Magic number in the pheader file does not match with kmagic or  
                         smagic number. Check the pheader file or reload with proper  
                         specification.  
e1                   Process pathname; process will not be created.  
INMEM BADMAGIC    The magic number in the library header was incorrect.  
INMEM OPEN        Library could not be opened for reading.  
f1                   Library pathname; library will not be locked.

| n1           | Segment index, in decimal notation. The segment being added to the address space of a kernel process overlaid a segment index already in use. The resultant process will have addressability into the second segment from code referencing both the first request and second request. This will most typically occur with the protected application segment. This message should be viewed seriously as this is a potentially disastrous situation. |

#### 4. ACTION TO BE TAKEN

Use the Error / Action Table to determine which of the actions should be taken.

1. Call application system support.
2. Application system support should call UNIX® RTR system support.
3. Check the displayed pathname for accuracy.
4. Possible System Generation (SYSGEN) specification change required.
5. Possible process specification file error.
6. Enter a `OP:STATUS;PROCESS,ALL` command for further documentation of problem.

ID ..... REPT:POWER  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

### 1. FORMAT

- [1] REPT POWER {RESTORED|REMOVED} a b [c d]
- [2] REPT POWER FAULT a b [c d]
- [3] REPT POWER DISTRIBUTION FRAME e f ALARM

### 2. REASON FOR OUTPUT

Format 1 indicates that a unit has been powered up or powered down by a manual request at a unit's power switch. The removal of power from a unit may be the result of a normal power down, a manual override power down, or the occurrence of faults where power is removed, such as a blown fuse.

Format 2 indicates that a power fault has been detected by scanning the unit's power switch (ABB1).

Format 3 indicates the occurrence of a major or minor alarm on the power distribution frame as detected by a scan point on the unit alarm circuit.

### 3. VARIABLE FIELD DEFINITIONS

- a Unit name.
- b Unit number.
- c Subunit name.
- d Subunit number.
- e Identification number (0-99999). This number is arbitrary and is retrieved from the logical group name in the scsdbody form found in the Equipment Configuration Database (ECD). If no number identification is in the group name, no number will be output.
- f Type of alarm:
  - MAJOR— Service is interrupted due to a power problem on another frame which resulted in a feeder fuse being blown on the power distribution frame.
  - MINOR— A local fuse on the power distribution frame has blown, but service is not interrupted.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For Format 1, take no action, unless power removed. Check for blown fuses and take appropriate action to restore power.

For Format 2, establish and repair the cause of the fault. Check the status of alarm LEDs on unit, diagnose, and repair.

For Format 3:

If a MAJOR alarm, determine the cause by looking at the accompanying messages. Fix the problem and replace the necessary output fuses on the power distribution frame.

If MINOR alarm, replace fuses on the power distribution frame charging or filtering circuits.

#### **5. REFERENCES**

OMDB Keys

Format 1 has an OMDB key of 139.

Formats 2 and 3 have OMDB keys of 141 for MINOR alarm and 142 for MAJOR alarm.

TYPE ..... Output

## 1. FORMAT

REPT POWER DISTRIBUTION FRAME   a   b   ALARM

## 2. REASON FOR OUTPUT

To indicate the occurrence of a major or minor alarm on the power distribution frame as detected by a scan point on the unit alarm circuit.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Identification number (0-99999). This number is arbitrary and is retrieved from the logical group name in the scsdbody form found in the Equipment Configuration Database (ECD). If no number identification is in the group name, no number will be output.
- b                      The event detected on the power switch.
- MAJOR — Service is interrupted due to a power problem on another frame which resulted in a feeder fuse being blown on the power distribution frame.
- MINOR — A local fuse on the power distribution frame has blown but service is not interrupted.

## 4. ACTION TO BE TAKEN

If variable b = MAJOR, determine the cause by looking at accompanying messages. Fix the problem and replace the necessary output fuses on the power distribution frame.

If variable b = MINOR, fuses on the power distribution frame charging or filtering circuits must be replaced.

CREATION FOR PROCESS a FAILED.  
CREATION SCHEDULED IN b MINUTES.
- [5] REPT PROC DEATH/CREATE  
CREATION FOR PROCESS a FAILED.  
CREATION DENIED.

## 2. REASON FOR OUTPUT

Reports the creation (including recreation), failure to create and death of IMS processes, imsrts.p, msdc.p, npp.p, op\_rtm.p, and tdc.p. These processes provide the following capabilities auxiliary to IMS.

|          |                                                                                               |
|----------|-----------------------------------------------------------------------------------------------|
| imsrts.p | 1105 and 1106 pages and node status reports.                                                  |
| msdc.p   | Measurement data collection.                                                                  |
| npp.p    | Node pumping.                                                                                 |
| op_rtm.p | Realtime usage monitor.                                                                       |
| tdc.p    | Trace, node ERRLOG, and, for IMS 3.2 and later, user output messages from RAPs (Smart Nodes). |

These events are not reported during IMS aborts or when they are probably caused by an IMS boot or FPI initialization. The initial creation of each of these processes due to such initializations is not reported if it is successful on the first try.

The capability is lost temporarily between the Format 1 and Format 3 messages or until an IMS level 3 or 4 initialization for the Format 2 and Format 5 messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

Following the Format 1 and Format 4 messages any remaining instances of the processes are terminated, the delay specified in the message is taken, any process then attached to the process' port is terminated, and recreation of the process is requested.

### 3. VARIABLE FIELD DEFINITIONS

- a Path name for process, ending in the process name.
- b The minimum number of minutes before creation of the process will be requested.

### 4. ACTION TO BE TAKEN

Format 1: If the reason for process death is not understood, notify technical support. Recovery will be automatic.

A UNIX® RTR level 1 initialization will sometimes kill imsrts.p, npp.p and / or tdc.p.

Field update of any of these processes could involve manually killing them.

Format 2: This message is expected only in IMS generic 3 or later when Disk Independent Operation is fully operational. The REPT:DIOP[unit] message should also be printed and the disk outage is the real problem.

Otherwise look for REPT:ERROR output message and seek technical assistance. Recovery will require at least an IMS boot.

Format 3: Normal operation of the process has resumed.

Format 4: See REPT:PMGR output message for the same process for specific error codes and seek technical assistance.

Occasional failures could be due to operating system resource shortages.

Repeated failure to create a process could indicate a bad or incompatible process file, a. A process built for the wrong version of shared libraries could corrupt the libraries and might require an IMS boot after the proper file is in place.

File access problems could indicate a bad field update, such as wrong permissions on a file or wrong file name.

The delay b in retrying process creation is intended to allow time for resource problems to abate or for correction of file problems.

Format 5: This message is expected only in IMS generic 3 or later when Disk Independent Operation is fully operational. The REPT:DIOP[unit] message should also be printed and the disk outage is the real problem.

Otherwise look for REPT:ERROR output message and seek technical assistance. Recovery will require at least an IMS boot.

## 2. REASON FOR OUTPUT

Format 1: Announces the start of a session with process psdio1a.

Format 2: Announces the end of a session and lists various statistical data for the session.

Formats 3-5: Indicate various conditions which prevented the successful establishment of a session.

Formats 6&7: Specify any unexpected BX25 indications received during a session.

Formats 8-10: Indicate that unexpected APS messages were received.

Format 11: Specifies that an abort code was received from the 1B machine for the session.

Format 12: Announces timeout conditions during a session.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- c A decimal integer specifying the 1B I/O channel being used.
- f A hexadecimal integer representing 32 flags that may be set during the course of a session to indicate the occurrence of an event. This value is also sent to the external user when a session ends. Flag assignments are:

| Bit | Value   | Meaning                                |
|-----|---------|----------------------------------------|
| 0   | 01      | Session disconnect received            |
| 1   | 02      | User data length wrong                 |
| 2   | 04      | Userid not found in password file      |
| 3   | 0x8     | Password check failed                  |
| 4   | 0x10    | Received inhibit from 1B               |
| 5   | 0x20    | No API client ID available (no port)   |
| 6   | 0x40    | Cannot connect to port                 |
| 7   | 0x80    | Cannot attach to AP driver             |
| 8   | 0x100   | Timeout waiting for 1B to open channel |
| 9   | 0x200   | Failure to open 1B channel             |
| 10  | 0x400   | Sesacc failed                          |
| 11  | 0x800   | Timeout waiting for BX25 FREETOSEND    |
| 12  | 0x1000  | Timeout waiting for BX25 read complete |
| 13  | 0x2000  | Unassigned                             |
| 14  | 0x4000  | Bxsreceive fail                        |
| 15  | 0x8000  | Illegal push of output buffer          |
| 16  | 0x10000 | Bufferfull from bxsreceive             |

SEE PROPRIETARY NOTICE ON COVER PAGE

|    |            |                                   |
|----|------------|-----------------------------------|
| 17 | 0x20000    | Bxsquery failed                   |
| 18 | 0x40000    | Session abort received            |
| 19 | 0x80000    | Datalost indication received      |
| 20 | 0x100000   | Unknown indication received       |
| 21 | 0x200000   | Unknown outer indication received |
| 22 | 0x400000   | API failure                       |
| 23 | 0x800000   | Unexpected 1B acknowledgment      |
| 24 | 0x1000000  | Fail bxssend                      |
| 25 | 0x2000000  | Unassigned                        |
| 26 | 0x4000000  | Abort from 1B machine received    |
| 27 | 0x8000000  | MSG_ACK from 1B timeout           |
| 28 | 0x10000000 | WT_ACK from 1B timeout            |
| 29 | 0x20000000 | Fail locseg for DMA message       |
| 30 | 0x40000000 | Fail ioqueuem for DMA message     |
| 31 | 0x80000000 | Unassigned                        |

- g A decimal integer.
- h A hexadecimal integer.\* The left half is the number of times a "not free to send" condition was detected; the right half is the number of BX25 messages that was received during the session.
- i A hexadecimal integer.\* The left half and the right half are the "take" and "load" pointers for the "not free to use" queue of output buffers.
- j A hexadecimal integer.\* The left half and the right half are the "take" and "load" pointers for the output buffer queue.
- k A hexadecimal integer.\* The left half is the number of "acks" sent to the 1B machine; the right half is the number of messages received from the 1B machine.
- NOTE \*:** In these cases, a 32 bit word printed as a hexadecimal number with leading zeroes suppressed.
- l A decimal number indicating the number of times the 1B refused a new input message because it was waiting for an "ack" from a 1B application program.

SEE PROPRIETARY NOTICE ON COVER PAGE

m The decimal value of an indication received.

n The decimal abort code received from the 1B machine; possible values are:

| <u>Value</u> | <u>Reason</u>                                                                           |
|--------------|-----------------------------------------------------------------------------------------|
| 4            | Received input from a channel not in an active session.                                 |
| 6            | Received a special handling message for a channel not having a special handling buffer. |
| 13           | Invalid message type field in APS message.                                              |

**NOTE:** The following codes, which may be generated during a session, do not abort the session; instead, a control byte of data is sent to the external user for information--no output is made on the APS machine:

| <u>Value</u> | <u>Reason</u>                                                                                                                                     |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 5            | Input message larger than channel member block or special handling buffer.                                                                        |
| 7            | The 1B refused the message because it was waiting for acknowledgment for the previous message. This condition persisted through message retrials. |
| 10           | The 1B machine failed to recognize special handling verb.                                                                                         |
| 15           | Unable to set up DMA operation on the APS.                                                                                                        |
| 16           | Special handling buffer is busy.                                                                                                                  |
| 17           | The 1B machine received a DMA complete for an I/O channel not waiting for it.                                                                     |
| 18           | The 1B machine timed out waiting for a DMA to complete.                                                                                           |
| 19           | The 1B machine timed out a channel in the output state, possible lost message.                                                                    |

## 1. FORMAT

This message has 13 formats.

- [1] REPT PSDIO3B START OF SESSION - USER u WITH a  
PORT b (p)
- [2] REPT PSDIO3B END OF SESSION - USER u WITH a  
BYTES IN g, BYTES OUT g, g SECONDS, CODE f
- [3] REPT PSDIO3B BADLOGIN ATTEMPT - USER u CODE f
- [4] REPT PSDIO3B UNKNOWN PROCESS CHARACTER m
- [5] REPT PSDIO3B USER ID u NOT FOUND IN PASSWORD FILE
- [6] REPT PSDIO3B PASSWORD CHECK FAILED FOR u
- [7] REPT PSDIO3B CANNOT CREATE PIPE
- [8] REPT PSDIO3B CANNOT FORK
- [9] REPT PSDIO3B ERROR ON OPEN FOR i ON j, ERRNO = k
- [10] REPT PSDIO3B CANNOT EXECUTE l
- [11] REPT PSDIO3B(u) UNKNOWN INDICATION n
- [12] REPT PSDIO3B(u) UNKNOWN OUTER INDICATION n
- [13] REPT PSDIO3B(u) BX25 q TIMEOUT

## 2. REASON FOR OUTPUT

Formats 1&2: Are routine messages announcing the start and end of a session with process psdio3b.

Formats 3-10: Indicate various conditions which prevented the successful establishment of a session.

Formats 11&12: Specify any unexpected BX25 indications received during a session.

Format 13: Announces timeout conditions during a session.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a String indicating process or function the user will use (the session connect message user data contains a process character that specifies the purpose of the session):
- CFTSHL — The craft shell, default or process character A  
 MONITOR — For DMS system, process character B  
 SH — Bin/sh, process character S  
 TOPAS — Will access TOPAS data, process character T
- b The port name connected to by the process (the 2nd line of the "START OF SESSION" message is omitted if a port is not needed).
- f A hexadecimal integer representing 32 flags that may be set during the course of a session to indicate the occurrence of an event. This value is also sent to the external user when a session ends. Flag assignments are:

| Bit | Value | Meaning                              |
|-----|-------|--------------------------------------|
| 0   | 01    | Session disconnect received          |
| 1   | 02    | Unassigned                           |
| 2   | 04    | Open error on named pipe             |
| 3   | 0x8   | Open named pipe timeout              |
| 4   | 0x10  | Sesacc failed                        |
| 5   | 0x20  | Fork failed                          |
| 6   | 0x40  | Cannot create pipe                   |
| 7   | 0x80  | Timeout waiting for<br>FREETOSEND    |
| 8   | 0x100 | Fstat failed on check<br>of read end |
| 9   | 0x200 | Timeout waiting for<br>FREETOUSE     |
| 10  | 0x400 | Bxssend failed                       |
| 11  | 0x800 | Bxsreceive fail                      |

| 23 | 0x800000   | Death of child received                                              |
| 24 | 0x1000000  | No idle named pipe                                                   |
| 25 | 0x2000000  | Userid not found in<br>password file                                 |
| 26 | 0x4000000  | Unknown process request<br>from user                                 |
| 27 | 0x8000000  | Session aborted due to<br>CNI ring trouble                           |
| 28 | 0x10000000 | Session aborted due<br>to resources problems                         |
| 29 | 0x20000000 | Chdir to user directory failed                                       |
| 30 | 0x40000000 | Unassigned                                                           |
| 31 | 0x80000000 | Unassigned                                                           |

---

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                         |
|---|-------------------------------------------------------------------------------------------------------------------------|
| g | A decimal integer.                                                                                                      |
| i | The string READ or WRITE                                                                                                |
| j | The path name for a named pipe.                                                                                         |
| k | The decimal value of errno for the open call.                                                                           |
| l | The path name of a process.                                                                                             |
| m | An illegal process character received in the user data for a session connect message (See variable a).                  |
| n | The decimal value of an indication received.                                                                            |
| p | The port number.                                                                                                        |
| q | The string "FREE-TO-USE", "FREE-TO-SEND" or "READ_COMPLETE".                                                            |
| u | User ID (found on bxslrmt form and in /etc/passwd) for the external user that initiated the session. Defined users are: |

4BLTST  
DMACOSS  
IRAS  
NMRNMS  
CNAC

## 1. FORMAT

- [1] REPT PSDO\_UMS.P FLT  
EFLAGS=a, FLTCODE=b
- [2] REPT PSDO\_UMS.P FLT  
EFLAGS=a, FLTCODE=b, PA=c  
R0=d, R7=e, R8=f

## 2. REASON FOR OUTPUT

The IMS pseudo measurement process (psdo\_ums.p) has encountered a hardware or software fault.

## 3. VARIABLE FIELD DEFINITIONS

- a Hexadecimal number which is the sum of the codes for all UNIX® RTR events outstanding for the IMS measurement process. (These are defined in UNIX® RTR header file evflag.h.)
- b The UNIX® RTR fault code.
- c If this is present, then the IMS pseudo measurement process was in execution at this virtual address when the fault was encountered.
- d Contents of 3B CU register r0.
- e Contents of 3B CU register r7.
- f Contents of 3B CU register r8.

## 4. ACTION TO BE TAKEN

Analyze the fault code (See References).

If the fault is not attributed to a hardware problem, seek technical assistance.

## 1. FORMAT

- [1] REPT PSM ERROR X'a GRPN b STATE X'c
- [2] REPT PSM ERROR X'a SYSTEM ERROR d GRPN b  
STATE X'c
- [3] REPT PSM ERROR X'a GRPN b

## 2. REASON FOR OUTPUT

Format 1 is to report the Power Switch Monitor (PSM) encountered an error while trying to perform an operation.

Format 2 is to report the PSM encountered an error while attempting to send a message to the Scanner and Signal Distributor Administrator (SCSDA).

Format 3 is to report an unidentified group has been requested to be operated upon.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code:
- 0xe0 — Error in Unit Control Block (UCB) pointer. Check addressing flags in the message.
  - 0xe1 — Error in unit number. Specified unit is not identified by the SCSDA.
  - 0xe2 — Error in logical group name. SCSDA cannot find reference to a group. Logical group unit may have been degrown. Check message. Possible save area corruption. Verify group in database.
  - 0xe3 — Error in duplex identification. Check message. Possible PSM save area corruption. Check database records.
  - 0xe4 — Scanner and Signal Distributor Controller (SCSDC) is possibly Out Of Service (OOS). Check status of SCSDC.
  - 0xe5 — Invalid point number. Check message. Possible PSM save area corruption. Check database record to verify that the point is included in the group.
  - 0xe6 — Address type not specified in message. Check message.
  - 0xe7 — Scanner and Signal Distributor Handler (SCSDH) failed to complete the operation. Check status of SCSDC and SCSDA. Check SCSDH error messages to determine the problem.
  - 0xe8 — Illegal class requested. Class cannot be monitored. Check message. See ecd.h for legal classes.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0xe9 — SCSDA cannot add client to list. Check for multiple occurrences of processes.
- 0xea — Unknown command type. Check message.
- 0xeb — SCSDA is in incorrect state to perform operations on the SCSDC. Check status of SCSDC.
- 0xec — Point from database record retrieved by SCSDA is illegal. Review database forms.
- 0xed — SCSDA could not update database.
- 0xee — No error.
- 0xef — Illegal operation requested. Check message.
- 0xf0 — Illegal number of operations requested per message. Check ad\_count in message.
- 0xf1 — SCSDA could not find the class requested to be monitored by PSM in any of the database forms. Check database forms and SCSDC equipage.
- 0xf2 — Operation could not be completed by SCSDH. Additional information can be obtained from SCSDH error message.
- 0xf3 — Unknown message type has been received by SCSDA from the SCSDH.
- 0xf4 — SCSDA cannot update database.
- 0x100 — PSM failed to send message to SCSDA. See msgport.
- 0x101 — PSM could not get a timing chain entry.
- 0x102 — PSM could not complete operation.
- 0x103 — Invalid message received by PSM from SCSDA. Check the Record Identification (RID) of unit specified in the database. Check message.
- 0x104 — PSM could not get UCB information for logical group. Possible corrupted RID in message. Review database form.
- 0x105 — PSM has determined group save area is corrupted. Reinitialize PSM.
- 0x106 — PSM could not identify group. Check message. Possible PSM corruption. In addition, check if group was rejected upon initialization.

b Logical group name.

c PSM mode of logical group values:

- 0x10 — Group is unavailable. PSM has encountered multiple internal errors.
- 0x11 — Group is idle.
- 0x12 — PSM is performing a directed scan operation.
- 0x13 — PSM is performing a distribute operation.
- 0x14 — PSM is performing an allow operation.
- 0x15 — PSM is waiting for inhibits to be cleared.

d System error code. See the *System Maintenance Manual*.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

For Formats 1 and 2, locate the offending code or hardware from the error code. Check the status of the hardware by using the OP:00S input message. Verify that the SCSDC is equipped. Verify that the database forms contain the proper data. If corrupted areas are found in PSM, the processes should be restarted to reinitialize. If PSM is suspected of being corrupted, procedures should be taken to produce a dump of the process and forward information to the service organization.

For Format 3, verify that the database forms contain the proper logical group name. Verify that the correct logical group was input.

#### 5. REFERENCES

OMDB Key

Formats 1,2, and 3 have an OMDB key of 138.

ID ..... REPT:QCOPY  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

- [1] REPT QCOPY WRITE ERROR DESTINATION FILESYSTEM MOUNTED
- [2] REPT QCOPY FROM a TO b BLOCKS= c
- [3] REPT QCOPY FILESYS /dev/root BYTES TO COPY d
- [4] REPT QCOPY QCOPY:DISK COPY COMPLETED  
02/08/90 17:15:20 #001755

## 2. REASON FOR OUTPUT

Format 1 indicates that QCOPY attempted to write to a mounted filesystem and aborted the operation.

Format 2 indicates that QCOPY is doing the copy operation to the destination filesystem displaying the block and byte count every 30 seconds for the filesystem being copied.

Format 3 indicates that QCOPY has successfully completed the copy operation for all the filesystems indicated in format [2].

## 3. VARIABLE FIELD DEFINITIONS

- a From filesystem name.
- b To filesystem name.
- c Blocks to copy.
- d Bytes to copy.

## 4. ACTION TO BE TAKEN

The user should analyze the ROP for any unsuccessful termination of QCOPY. Action to be taken depends on the termination status of QCOPY.

APPLICATION .. 4E  
TYPE ..... Output

### 1. FORMAT

REPT RCAS PROC (task): msg

### 2. REASON FOR OUTPUT

To report RCAS status and errors.

### 3. VARIABLE FIELD DEFINITIONS

| task      | The RCAS task generating the report:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |      |          |      |                                         |         |                              |          |                              |       |                            |        |                            |         |                           |         |                            |           |                    |         |                        |       |                      |        |                           |

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT RCVRY CU a COMPLETED

## 2. REASON FOR OUTPUT

To report that the initialization interval of the active Control Unit (CU) is complete.

## 3. VARIABLE FIELD DEFINITIONS

a                      Member number (0-1).

## 4. ACTION TO BE TAKEN

The cause of the initialization can be determined by accessing the most recent post-mortem dump from PMLOG. (Use the OP:LOG input message and specify the current date.)

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT RCVRY DUI a b [c]

## 2. REASON FOR OUTPUT

To report the outcome of a Direct User Interface (DUI) subdevice recovery attempt. The DUI, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

## 4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit.

## 1. FORMAT

REPT RCVRY HSD a b [c]

## 2. REASON FOR OUTPUT

To report the outcome of a High-Speed Synchronous Datalink (HSD) recovery attempt. The HSD, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                                                      |

## 1. FORMAT

REPT RCVRY SDLC a b [c]

## 2. REASON FOR OUTPUT

To report the outcome of a Synchronous Datalink Controller (SDLC) recovery attempt. The SDLC, initially in the active state, changes to the recovery state when the first error is detected. It remains in this state until the recovery is either successful or the unit is removed from service because of a high error count.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                                                      |
|---|----------------------------------------------------------------------------------------------------------------------|
| a | Member number.                                                                                                       |
| b | Termination status:<br><br>ABORTED — An error occurred: recovery failed.<br><br>COMPLETED — Recovery was successful. |
| c | Additional error information. See IOP Output Appendix F, APP:IOP-F.                                                  |

## 4. ACTION TO BE TAKEN

If the unit is ultimately removed from service (because of a high error count), run diagnostics and repair the unit.

## 2. REASON FOR OUTPUT

Reports errors encountered when executing the input command, SET:AMA;RC. Shows the output from the OP:AMA;RC command.

Format 1 is printed when there was no data specified on the input command line.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 2 is printed when the number of characters specified on the input command line is not correct.

Format 3 is printed when the keyword specified on the input command line is not specified correctly.

Format 4 is printed when a message cannot be sent to the Automatic Message Accounting (AMA) formatter process to update the parameters.

Format 5 is printed when a file cannot be created on the 3B tmp filesystem.

Format 6 is the header plus the output from the `OP:AMA;RC` command.

### **3. VARIABLE FIELD DEFINITIONS**

- |   |                                         |
|---|-----------------------------------------|
| a | Internet Protocol Numeric address.      |
| b | Alpha-Numeric ID of 11 characters.      |
| c | Alpha-Numeric Password of 8 characters. |
| d | ffffff00 or 00ffffff.                   |
| e | ON or OFF.                              |

### **4. ACTION TO BE TAKEN**

The user needs to re-enter the command with the correct information. For the format 4 case, the AMA formatter process may need to be restarted.

- [3] REPT RETRO ERROR - UNABLE TO CREATE a SYSTEM ERROR b
- [4] REPT RETRO - BUILDING THE ECD CONVERSION SCRIPT
- [5] REPT RETRO - ECD CONVERSION COMPLETE c ERRORS DETECTED

## 2. REASON FOR OUTPUT

To report the status and completion of a retrofit process. The process extracts the office dependent information from the current office ECD and builds a retrofit script to be applied to the new ECD.

## 3. VARIABLE FIELD DEFINITIONS

- a Path name of the file that caused the error to print.
- b Error number returned by the system.
- c Total number of errors detected.

## 4. ACTION TO BE TAKEN

Format 1 results when the wrong number of arguments is entered. Re-execute the command using the correct number of arguments.

Format 2 results when the specified file cannot be opened. Determine if the file exists. If the file does not exist, check for previous retrofit failures. If the file does exist, re-execute the command. If errors persist, contact your support organization.

Format 3 results when the specified file cannot be created. Check if there is enough room in the filesystem.

Format 4 is an information message. No action is required.

Format 5 reports the completion of the retro process. No action is required if there are zero errors. Otherwise, correct previous errors before proceeding.

SEE PROPRIETARY NOTICE ON COVER PAGE

**5. REFERENCES**

None.

ID ..... REPT:REX  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT REX UNABLE TO SEND MESSAGE TO  
APPLICATION REX PORT
- [2] REPT REX UNABLE TO REQUEST PORTSWITCH FOR IOP  
DIAGNOSIS
- [3] REPT REX ROP PORTSWITCH REQUEST DENIED
- [4] REPT REX MTTY PORTSWITCH REQUEST DENIED
- [5] REPT REX MAJOR ALARM a
- [6] REPT REX CANNOT OPEN b
- [7] REPT REX TERMINATED-INTERNAL REQUEST
- [8] REPT REX MINOR ALARM a

## 2. REASON FOR OUTPUT

For Format 1, before Routine Exercise (REX) removes the Input/Output Processors (IOPs) for diagnosis, it will send a message to PT\_REX to notify the applications of the removal. The applications can then gracefully stop their datalink transmission. If no process is connected to this port, this message will be printed and execution will continue normally.

For Format 2, before REX removes an IOP for diagnosis, it must make sure the portswitches for the Maintenance Teletypewriter (MTTY) or Receive-Only Printer (ROP) are not active. This message indicates REX had a problem locating the Unit Control Block (UCB) for the ROP or MTTY.

For Format 3, REX sent a request to portswitch the ROP and it was denied or could not be executed.

For Format 4, REX sent a request to portswitch the MTTY and it was denied or could not be executed.

For Format 5, essential unit found to be Out Of Service (OOS).

For Format 6, REX could not open the specified file to output the REX report.

For Format 7, REX received a sigterm signal and is terminating.

SEE PROPRIETARY NOTICE ON COVER PAGE

For Format 8, REX found an OOS unit with a controlling unit that is an IOP. This is a condition to signal a minor alarm.

### **3. VARIABLE FIELD DEFINITIONS**

- a Name and number of the essential unit found to be OOS.
- b Name of the output file for REX report.

### **4. ACTION TO BE TAKEN**

For Format 1, this report can be ignored if the application does not wish to receive the message from the UNIX® RTR REX process.

For Format 2, check the status of IOP subunits and portswitches (ROP and MTTY). Verify that a portswitch can be executed.

For Format 3, check to see if a manual portswitch can be requested.

For Format 4, check to see if a manual portswitch can be requested. Also check the states of the IOP subunits.

For Formats 5 and 8, request a restore on the hardware unit or community. No further action is required if the restore is successful. If the hardware unit or community failed the restore, manual action is required to diagnose, repair, and restore the hardware unit or community to service.

For Format 6, determine if the specified file system is full and remove unneeded files.

For Format 7, no action is required.

## 1. FORMAT

REPT REX SUMMARY {IN PROGRESS | COMPLETED}  
TIME      EQUIPMENT ID      RESULT      RET      STATE  
a          b c [d e]          f          [g]          h

## 2. REASON FOR OUTPUT

To report a summary of Routine Exercise (REX) results for all hardware units that were exercised.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Local time (hours, minutes, and seconds) when the exercise of the unit finished.
- b                      Unit name.
- c                      Unit number.
- d                      Subunit name.
- e                      Subunit number.
- f                      Result of exercising the specified unit:
- ABT      — Diagnostics were aborted.
  - ATP      — All tests passed.
  - CATP     — Conditional ATP.
  - ERR      — Error return code received from Maintenance Input Request Administrator (MIRA).
  - FAULT    — Unit was excessively faulty.
  - INH      — REX was inhibited for this unit.
  - MAN      — Unit was removed manually.
  - NODGN    — No diagnostic phases exist for this unit.
  - NRPY     — No reply received from MIRA.
  - NTR      — No tests were run.
  - OOS      — Unit was Out Of Service (OOS) and could not be exercised.
  - PORTSW   — Could not portswitch.
  - STF      — Some tests failed.
  - TIMEOUT — Timeout occurred.
- g                      Return code:
- 2 — Request inhibited.
  - 3 — MIRA out of buffers.
  - 4 — MIRA cannot spawn Diagnostic Monitor (DIAMON) program.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — Duplicate request already in queue.
- 6 — Request aborted by STOP:DMQ request.
- 7 — Internal problem; request aborted.
- 8 — Remove attempt failed.
- 9 — Restore attempt failed.

h

The state of the unit after REX exercised it:

|         |                   |
|---------|-------------------|
| ACT     | — Active.         |
| GROW    | — Grow state.     |
| INIT    | — Initializing.   |
| OFL     | — Off-line.       |
| OOS     | — Out of service. |
| STBY    | — Standby.        |
| UNAV    | — Unavailable.    |
| UNEQUIP | — Unequipped.     |

**NOTE:** This variable field reflects the state of the unit when the exercise of the unit finished, which may not be the current state of the unit. If external events result in the removal of a unit (that is, manually removed, removed from a fault, softswitch, etc.) after REX has exercised it, the new state is not reflected in this variable.

#### 4. ACTION TO BE TAKEN

If any units failed diagnostics or were left out of service, manual action is required to restore them.

## 2. REASON FOR OUTPUT

Format 1: Printed whenever a new ring configuration has been successfully established, either manually or automatically. A normal ring configuration has been established.

Format 2: Printed whenever a new ring configuration has been successfully established, either manually or automatically. One or more ring nodes have been isolated from the active ring forming an isolated ring segment. The indicated BISO (Beginning of isolation) and EISO (End of isolation) nodes bound the isolated ring segment on each side. The convention used is as follows: Ring 0 identifies the ring that propagates messages around the ring, following the ring nodes in ascending order (e.g., LN16 1 to LN16 2 to LN16 3, etc.). Similarly, Ring 1 identifies the ring that propagates messages around the ring, following ring nodes in descending order. As Ring 0 is traversed in the direction of message propagation, the BISO node is the last node encountered in the active ring segment before entering the isolated ring segment. Similarly, the EISO node is the first node encountered in the active ring segment as Ring 0 is traversed out of the isolated ring segment.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3: Is printed whenever an attempt to establish a new ring configuration was unsuccessful. Ring EAR (Error Analysis and Recovery) is activated and will attempt to establish a working ring configuration. An attempt to establish a normal ring configuration failed.

Format 4: Is printed whenever an attempt to establish a new ring configuration was unsuccessful. Ring EAR (Error Analysis and Recovery) is activated and will attempt to establish a working ring configuration. An attempt to establish an active ring segment with the indicated BISO and EISO nodes failed.

Format 5: This report is issued whenever Ring EAR requests a ring configuration of level 2 or less in an attempt to establish a working ring. The request is made as a result of a fault associated with one or more ring nodes, or a failure of an ongoing configuration. Level 0 represents an attempt to establish the previous ring configuration. Level 1 indicates a configuration based on reported ring errors. Level 2 indicates an escalation from a Level 1 configuration that includes isolating additional nodes.

Format 6: This report is issued whenever Ring EAR makes a ring configuration request that is rejected immediately. The reason for the rejection and the reject code are specified. This report is issued in lieu of Format 5. Escalation to level 3 is immediately made.

Format 7: This report is issued whenever Ring EAR requests level 3 or greater ring configuration. This can occur in response to a failure of a lower level reconfiguration attempt, or in response to non-deterministic failures such as loss of ring token.

Format 8: This report is issued following a Ring EAR level 4 or 5 recovery where the recovery procedure did not identify any faulty nodes beyond those already believed to exist. In other words, there was no trouble found in the level 4 or 5 testing. When a Ring EAR level 4 completes in this manner, the normal 5 second Ring EAR confidence interval is extended to 30 seconds. This is done so that any subsequent ring failure within 30 seconds will cause escalation to a Ring EAR level 5 recovery. Here, the level 5 recovery may identify an intermittent failure missed by the level 4 recovery.

Format 9: This report is issued following either a Ring EAR level 5 recovery or the ring initialization phase of a level 4 IMS initialization where a ring problem was detected, but its exact location could not be resolved. Problems exhibiting an intermittent failure behavior pattern can cause this. When this report is issued, Ring EAR has isolated a range of nodes which is believed to contain the faulty equipment. This range of nodes may at times be quite large.

Format 10: This is printed whenever a BISO or EISO node becomes inactive. After the first message, subsequent messages of this format will be printed periodically until the inactive BISO and/or EISO node or another nearby node is restored.

Format 11: This report is issued when an excessive number of attempts to reconfigure the ring fail to establish a usable ring. The action taken is dependent upon whether IMS is performing a high level initialization. If so, the ring is placed in the down state and the boot sequence continues. If not, a Full Process Initialization of IMS is initiated. The final contents of the message will identify which action is taken.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 12: Ring blockage due to ring congestion may occur when the ring capacity is less than a safe threshold. Ring capacity (in bytes) is determined by summing the capacity of the ring FIFO buffers of every ring node and IFB in the active ring. Output message Format 12 is printed when a ring configuration is established that has a ring capacity less than the safe threshold. After the first message, subsequent messages of this format will be printed at ten-minute intervals until the ring configuration is changed.

Format 13: This output message is printed when a ring configuration is established that has a ring capacity greater than the safe threshold. In addition, this message is only printed if the previous ring configuration caused output message Format 12 to print.

### 3. VARIABLE FIELD DEFINITIONS

- a, b Identifies a ring node name (e.g., RPCN16 0, LN32 5).
- c The rejection code returned by ring.cnfg, Format 6. (See variable d)
- d The reason for rejection, Format 6:

| CODE | REASON                                            |
|------|---------------------------------------------------|
| 2    | IMS RING CONFIGURATION PROGRAM ERROR              |

| 17   | REQUESTED RING CONFIGURATION ALREADY EXISTS       |

- e The reason for the requested configuration:
- EAR — RING TRANSPORT ERRS have been received, or an escalation of an ongoing config attempt failed.
  - IUN TEST — During initialization, the IUN test phase caused ring blockage.
  - CNFG RQST — A normal ring configuration failed and escalated to EAR.
  - INTRNL RQST — The previous BISO or EISO was not active.
- f Internal state information primarily intended for AT&T Bell Laboratories use.
- g The Real Time Clock value when the report was formatted. The Real Time Clock has a granularity of 1ms. Used in correlation with other reports.

SEE PROPRIETARY NOTICE ON COVER PAGE

- h Approximate ring silence time, primarily intended for AT&T Bell Laboratories use.
- i The level of ring recovery currently being undertaken.
- j The reason code for the config job failure:

| CODE | REASON                                                       |

| 19   | ISOLATOR INTEGRITY TEST FAILED                               |
| 20   | RING TEST FAILED; HAVE NORM, EXPECTED ISO                    |
| 21   | RING TEST FAILED; HAVE ISO, EXPECTED NORM                    |
| 22   | RING INITIALIZATION FAILED, RING IS DOWN                     |

- k Status of restoral activity on the OOS BISO/EISO node:
- WAITING FOR NODE a TO BE RESTORED  
This does not imply that a restore is in progress on node a, but rather that node a must be restored, either manually or automatically, before the system can return to a stable state.
- ACTIVE RING SEGMENT NOT LONG ENOUGH  
There is insufficient ring capacity to allow the isolated segment to be extended.
- NO BISO/EISO CANDIDATES AVAILABLE  
There are no nodes in a suitable state to serve as a BISO/EISO node.
- m The ring configuration time. Used in correlation with other reports.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                                                                                                                           |
|---|-------------------------------------------------------------------------------------------------------------------------------------------|
| n | The Real Time Clock value when the ring configuration job completed (or aborted). Used in correlation with other reports.                 |
| p | The ring capacity in bytes of the current ring configuration.                                                                             |
| q | The ring capacity "safe" threshold. If the ring capacity is greater than this value, ring blockage due to ring congestion will not occur. |

#### 4. ACTION TO BE TAKEN

Format 1: No action is necessary, a normal ring configuration exists.

Format 2: No action is necessary, an isolated segment exists.

Formats 3 & 4: No action is necessary. Ring EAR is activated and will attempt to establish a working ring. A Format 5 output message should precede this message for every ring configuration attempt requested by Ring EAR, followed by a Format 1, 2, 3, or 4 output message, until a working ring configuration is successfully established, indicated by a Format 1 or Format 2 output message.

Format 5: If this output message precedes either a Format 1, 2, 3, or 4 output message, Ring EAR is in progress and attempting to establish a working ring configuration. No action is necessary.

Format 6: The requested level configuration failed for the reason given. Escalation is made immediately to a level 3 configuration. No action is necessary.

Format 7: A level of configuration equaling 3 or greater has been requested by Ring EAR. These recovery levels involve the use of ring communication tests to determine what portion of the ring is usable. The higher the level, the more exhaustive the communication tests are and, correspondingly, the longer the recovery action will take. A usable ring configuration is determined from the results of these tests. No action is necessary.

Format 8: A level 4 or 5 Ring EAR recovery yielded no trouble found. No action is necessary. However, be aware that there may be an intermittent problem somewhere in the ring. Transient problems that are difficult to locate may sometimes be identified by monitoring ring performance over an extended period of time.

Format 9: This report indicates that Ring EAR procedures for locating a ring problem are insufficient. It is probable that the problem is within the range of isolated nodes. Unfortunately, at times this may involve many nodes. Problems exhibiting an intermittent failure where the time between failures is greater than 5 seconds can cause this. Physical stressing of interframe buffer cable connections, ring node circuit pack seating, etc., may stimulate the problem to occur frequently enough to be detected by ring node diagnostics. Also, past ring maintenance history may give some indication as to a suspect area of the isolated range of nodes. Finally, a last ditch and tedious effort to localize the problem could be done with repeated applications of the following procedure. Given a range of isolated nodes, remove the ring node circuit packs at a subset of this range, conditionally restore the other isolated nodes to service, and monitor the ring performance for instability.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 10: If Critical Node Restoral (CNR) is active, no action is necessary. The inactive BISO/EISO node or a suitable replacement will be automatically restored to service and the ring reconfigured if necessary. If Critical Node Restoral is inhibited (should never be unless all diagnostics are inhibited, e.g., via INH:DMQ (SRC ALL option), manual action must be taken. Use the OP:DMQ command to verify CNR is inhibited. Use the status field in this message or the OP:RING command to determine which node (BISO or EISO) is inactive, and attempt to manually restore the node. If this is unsuccessful, attempt to restore the unisolated node adjacent to the inactive BISO/EISO node. If the restore is successful, the ring will be automatically reconfigured. If the restore fails, continue to manually restore nearby unisolated nodes until a configuration with active BISO and EISO nodes is established.

Format 11: Internal fault recovery strategies have failed. Seek immediate assistance to determine the cause of the ring problems. If this occurs during a high level IMS initialization, the ring will remain in the down state pending manual intervention. Otherwise, the ensuing IMS boot will determine the state of the ring and the application.

Format 12: Operation with the ring capacity below the safe threshold for an extended period of time should be avoided. The most likely situation where this can occur is when an IRN node is grown or retrofitted into a previously all SSI node ring. When this occurs, the safe ring capacity threshold is automatically adjusted upwards. If the proper padded IFB hardware has not been retrofitted into the ring, output message Format 12 may be printed following the growth/retrofit procedure. It is important to provide the proper padded IFBs when IRN nodes are introduced into a previously all SSI node ring. In another situation, the isolation of multiple ring nodes can reduce ring capacity to the point where output message Format 12 will print. Obviously, every effort should be made to restore the ring to a normal configuration.

Format 13: No action is necessary.

## 2. REASON FOR OUTPUT

Format 1: Prints when an improper change of major state of a ring node is made via the UNIX® RTR Recent Change and Verify (RC/V).

Formats 2 - 7: Prints when the major state of a ring node has been changed from UNEQIP to GROW via UNIX® RTR RC/V, and the IMS DRIVER PROCESS detects a UCB data entry that prevents the IMS DRIVER PROCESS from honoring the change. The data discrepancy detected for each of these formats is as follows:

Format 2: Here, the UCB containing the entry RPC in the device\_type field has been assigned a member number other than 0 in the unit\_number field. RPC member numbers must be 0.

Format 3: Here, the UCB containing the entry RUN in the device\_type field has been assigned the member number 0 in the unit\_number field. IUN member numbers must be in the range 1 - 15.

Format 4: Here, the last two characters entered in the UCB unit\_name field are not numbers or are out of range (above 63), and/or the member number entered in the unit\_number field is out of range (above 15).

Format 5: Here, the entry in the internal\_device field of an RPC UCB is out of range (above 15).

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6: Here, the entry in the `internal_device` field of an RPC UCB is a duplicate of the entry in an already equipped RPC UCB. All equipped RPC UCBs contain different `internal_device` values.

Format 7: Here, the last two numbers in the UCB `unit_name` field and the number in the `unit_number` field are identical to those of an already equipped ring node UCB.

Format 8: Prints when a pseudo\_node UCB containing the entry RUN in its `device_type` field has been recent changed out of the GROW major state. These pseudo\_nodes must remain in the GROW state.

Format 9: Prints when a program failure has occurred in accessing the ECD.

Format 10: Prints for informational purposes, when the IMS detects a UCB major state change to the UNEQIP state, which IMS determines to be action taken by the user towards correcting an irregularity of Formats 2 through 9.

Format 11: Prints when a mismatch of the UCB HV field between the RPC.DLN UCB and the IUN.DLN UCB has been detected.

Format 12: Prints when the IMS internal DLN information table already contains an entry for the node undergoing growth.

Format 13, 14: Prints when the specified node is in the state specified. This is for information only.

Format 15: Prints when it has been detected that the IUN.DLN UCB was degrown before degrowing the RPC.DLN UCB in a degrowth procedure.

Format 16, 18: Prints as a reminder.

Format 17: Prints when the IMS detects duplicate entries with specified node id in the buffer description table supplied by the IMS applications.

Format 19: Prints when, after degrowth, the IMS internal DLN information table still contains an entry(s) with the same node id.

Format 20: Prints when the size of the imdb.p and mscntl.p libraries is insufficient to allow growth of a node.

### 3. VARIABLE FIELD DEFINITIONS

- a                      How the erroneous change request was handled:
- REJECTED — IMS refused to recognize the request. The state in the ECD is inconsistent with IMS's internal state.
- TOLERATED — The change was accepted.

SEE PROPRIETARY NOTICE ON COVER PAGE

- b Identifies the ring node member name (e.g., RPCN00 0). If the node name starts with ???, either there is no ECD record corresponding to this node or the the IMS private record indicates that this node is UNEQIP.
- c Old major state claimed by UNIX® RTR Recent Change and Verify: ACT, STBY, UNAV, OFL, OOS, UNEQIP, INIT, GROW, or BADVAL for an illegal value.
- d New major state requested via UNIX® RTR Recent Change and Verify: ACT, STBY, UNAV, OFL, OOS, UNEQIP, INIT, GROW, or BADVAL for an illegal value.
- e Old major state claimed by IMS subsystem: ACT, STBY, UNAV, OFL, OOS, UNEQIP, INIT, GROW, or BADVAL for an illegal value.
- f If present, this may identify a conflicting situation; otherwise, the state change itself is in error.  
  
DURING IMS INIT OR ABORT—IMS was being initialized or was aborting.  
  
DURING RING CFR—The ring was being reconfigured. This is normally very brief and may be caused by diagnostics, the CFR:RING command or various problems.  
  
WHILE NODE IN ACT RING SEG—Growth and degrowth are not permitted while the node is in the active segment of the ring.  
  
FOR DLN RPC-LIKE RECORD—A DLN node has two UCB records. The state change shown is illegal for the UCB which shows the DLN RPC-like properties. (That record should always be in the GROW or UNEQIP state. The major state of the DLN in craft displays is controlled by the other UCB, which defines the IUN aspects of the DLN.)
- g A decimal value representing the internal\_device entry found in the UCB.
- h Same as for variable b.
- i A decimal value representing the physical node id of the given node.

#### 4. ACTION TO BE TAKEN

Format 1: If a = REJECTED then the node's major state as represented in the ECD is inconsistent with IMS's view of the node's state. The node's state in the ECD must be changed via UNIX® RTR's Recent Change and Verify interface to agree with the value shown in the e variable.

If the change was rejected due to a conflicting situation (see the f variable), then it should be backed out immediately and may be retried later when the situation has changed.

If a = TOLERATED then steps of the growth procedures have been skipped and the user should ensure that the ring cabling actually reflects the new major state shown in the d

SEE PROPRIETARY NOTICE ON COVER PAGE

variable. If it does not, it may be necessary to change the state back to its original value via UNIX® RTR's Recent Change and Verify.

Formats 2, 3, 4, and 7: The UCB defined by b in the output message should be immediately changed from the GROW to the UNEQIP major state via UNIX® RTR RC/V, and then deleted from the ECD. The discrepancy in the UCB should be determined and a corrected version inserted back into the ECD.

Formats 5 and 6: The UCB defined by b in the output message should be immediately changed from the GROW to the UNEQIP major state via UNIX® RTR RC/V. The discrepancy in the UCB should be determined and the UCB updated to correct it.

Format 8: The UCB defined by b in the output message should be changed immediately to the GROW major state via UNIX® RTR RC/V.

Format 9: Take action specified for ERRLOG. If ring node growth is currently in progress, and a UNIX® RTR recent change transaction had been executed immediately prior to receipt of the output message, a new recent change transaction should be entered to restore the ECD to its previous state.

Format 10: Verify that the ECD action was in fact a corrective action.

Formats 11 - 19: After an error, the growth/degrowth procedure must be thoroughly undone before progressing further. The basic rule of growing a DLN is to change the major state of the RPC.DLN UCB from UNEQIP to GROW first, then change the major state of the IUN.DLN UCB from UNEQIP to GROW and then from GROW to OOS. The basic rule of degrowing a DLN is to change the IUN.DLN UCB major state from OOS to GROW, then from GROW to UNEQIP, and then change the major state of the RPC.DLN UCB from GROW to UNEQIP.

For messages concerning the IMS application, contact the technical personnel of the appropriate organization.

For messages concerning the IMS internal information table, check the ECD to make sure there is no duplication of node id.

Format 20: For the node growth to take place, either other nodes must be degrown to a free memory slot in the measurement libraries imdb.p and mscntl.p, or imdb.p and mscntl.p must be rebuilt to provide additional slots in memory.

LEVEL 3 INITIALIZATION QUERY COULD NOT DETERMINE RING  
CONFIGURATION
- [9] REPT RING INIT FLT  
AN OPERATIONAL FAILURE WAS ENCOUNTERED WITH THE FOLLOWING  
NODES  
a, b, c

## 2. REASON FOR OUTPUT

Format 1 or 2 is printed at the conclusion of the ring initialization sequence in an IMS initialization when ring communications were successfully established.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 1: Is printed when a normal ring configuration was established.

Format 2: Is printed when one or more ring nodes were isolated from the active ring forming an isolated ring segment. The indicated BISO (Beginning of Isolation) and EISO (End of Isolation) nodes bound the isolated ring segment on each side. The convention used is as follows: Ring 0 identifies the ring that propagates messages around the ring, following the ring nodes in ascending order (e.g., LN16 1 to LN16 2 to LN16 3, etc.). Similarly, Ring 1 identifies the ring that propagates messages around the ring, following ring nodes in descending order. As Ring 0 is traversed in the direction of message propagation, the BISO node is the last node encountered in the active ring segment before entering the isolated ring segment. Similarly, the EISO node is the first node encountered in the active ring segment as Ring 0 is traversed out of the isolated ring segment.

Format 3, 4, 5 or 6 is printed at the conclusion of the ring initialization sequence in an IMS initialization when ring communications were not successfully established.

Format 3: All available STANDBY RPC nodes are used to communicate with the ring during ring initialization. When there are no STANDBY RPC nodes available, there are no communications paths to the ring. This, by definition, results in ring initialization failure.

Format 4: When one or several ring nodes or sections of the ring must be isolated from the active ring, the remaining portions of the ring define one or more ring segments that are candidates for the active ring segment. In order for a candidate ring segment to be acceptable for use as the active ring segment, it must contain:

- a. At least one STANDBY RPC node.
- b. An acceptable combination of ring nodes and interframe buffer circuits such that the ring segment exceeds a specified minimum for IMS message length buffer capacity.

When there is more than one acceptable active ring segment candidate, the number of ring nodes in the segment is used as a selection criteria to choose the best candidate. Output message Format 4 is printed when there is no acceptable ring segment candidate available for the active ring segment.

Format 5: The ring initialization sequence found no ring nodes in the GROW state and no ring faults associated with any ring node. An attempt to establish a normal ring configuration failed for an unknown reason.

Format 6: The ring initialization sequence found that one or more ring nodes must be isolated. For this to occur, either one or more ring nodes are in the GROW state and/or

- a. Level 4 IMS Initialization - A ring fault was found to be associated with one or more ring nodes.
- b. Level 3 IMS Initialization - The ring query operation failed and RPC node to RPC node communications tests failed across one or more RPC node to RPC node ring segments.

An attempt to establish an active ring segment with the indicated BISO and EISO nodes failed for an unknown reason.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7 is printed when the ring initialization sequence in an IMS level 4 initialization has discovered a ring fault associated with one or more ring nodes. These nodes are identified by this output message.

Format 8 is printed when ring initialization's query of the ring in an IMS level 3 initialization sequence could not determine the ring configuration. Ring initialization has escalated to performing communications tests on the ring in an attempt to find a usable active ring segment.

Format 9 is printed at the conclusion of the ring initialization sequence in an IMS level 4 initialization when one or more Link Nodes have failed a ring communications test. The faulty Link Nodes are identified by this output message. This communications test is performed immediately following the establishment of communications on the ring and before Link Nodes are downloaded. Link Nodes reported by output message Format 7 were found to be faulty while still in quarantine, while Link Nodes reported by this output message were found to be faulty during the communications test with the nodes unquarantined.

### 3. VARIABLE FIELD DEFINITIONS

a, b, c                      Identifies a ring node name (e.g., RPCN16 0, LN32 5).

### 4. ACTION TO BE TAKEN

Format 1: No action is necessary, a normal ring configuration exists.

Format 2: Level 4 IMS initialization: No action is necessary. A ring node will be isolated either because it is in the **GROW** state or because a ring fault is associated with it. If any node was isolated as a result of a fault, a Format 7 output message will accompany this message.

Level 3 IMS Initialization: The ring is queried to determine what the bounds, if any, are on the active ring segment. The results of the query are used to redefine the active ring segment in the 3B processor data. However, if this query finds the ring to be nonoperational or it reports some inconsistency, the query is declared a failure and the following procedure is performed. The ring is partitioned into ring segments where the **STANDBY** RPC nodes define the segment endpoints. RPC node to RPC node communication tests are performed across each of these ring segments. Nodes that are in the **GROW** state or RPC node to RPC node ring segments that do not pass the communications test will be isolated.

No action is necessary if this message is not preceded by a Format 8 output message.

In this situation, the query has discovered the bounds of the existing active ring segment. However, if a Format 8 output message does precede this message, the IMS system will automatically execute diagnostics on the isolated ring segment in an attempt to restore the isolated ring nodes (except in **MIN-MODE**). This will occur following IMS initialization completion. The results of the diagnostics [Ref 1, 2] should provide information on one or more ring faults within the isolated ring segment. These faults must be cleared before a restoral of the isolated nodes can be successful.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3: Determine why the restore of OUT OF SERVICE RPC nodes was unsuccessful. At least one of these ring nodes must be capable of being restored before ring initialization can be successful.

Format 4: In an IMS level 4 initialization, this message will usually be accompanied by a Format 7 output message. Some, if not all, of these ring faults must be cleared before ring initialization can be successful. In an IMS level 3 or 4 initialization, verify that none of the equipped ring nodes are in the GROW state. Also, improper interframe buffer circuit information in the ECD could be the cause of this output message. It is also possible that RPC to RPC ring segments determined to be faulty in a level 3 initialization have fragmented the ring such that an acceptable active ring segment does not exist. In this situation, an IMS level 4 initialization is required.

Format 5 and Format 6: The IMS system has determined what it thought the bounds on the active ring segment should be. However, an attempt to establish this as the active ring failed. Technical assistance should be sought in this situation.

Format 7 and Format 9: An IMS level 4 initialization has discovered a ring or node processor fault associated with these nodes. These faults must be cleared before these, as well as nodes isolated because of these faults, can be restored.

Format 8: This output message may precede output message Formats 1, 2, 4, 5 or 6 in a level 3 IMS initialization. No action should be taken based on this output message alone. Action should be taken as indicated under output message Format 2 when this message precedes a Format 2 output message.

## 2. REASON FOR OUTPUT

Format 1 error messages report problems involving ring or ring node communications. The TRANSIENT RAC ERROR and SOURCE MATCH error types will not disrupt ring communications while other error types will. When ring communications are disrupted, Error Analysis and Recovery (EAR) will initiate ring reconfiguration activity to reestablish a working ring. The recovery action taken when a ring failure occurs depends on the recent history of ring stability. EAR operates in one of two modes. In the "stable" mode, EAR will assume that all ring failure events are transient in nature. Consequently, on a ring failure, the first recovery action attempted will be to restore the ring to the configuration that existed prior to the failure (via EAR recovery level 0). If this fails, EAR will escalate to a recovery action that usually isolates the faulty portion of the ring (via EAR recovery level 1 or 3).

EAR will keep track of the number of ring failures that occur. This is done by remembering ring failures over the recent past, typically for one hour. If the failure rate in this timed interval becomes excessive, EAR will switch its mode of operation to the "quasi-unstable" or seemingly-unstable mode. In this mode, EAR will assume that all ring failure events are not transient in nature. The first recovery action attempted here will usually isolate the faulty portion of the ring (via EAR recovery level 1 or 3). It should be noted that there are rare exceptions to this rule where a level 0 recovery attempt will be tried first. For example, if a level 1 recovery attempt would cause the last Ring Peripheral Controller Node (RPCN) to be removed from service, a level 0 will be attempted first. Once in the quasi-unstable mode of operation, EAR will automatically switch back to the stable mode when the ring has remained error free for a timed stability period, again typically one hour.

A READ FORMAT ERROR message is reported when a node receives a message that is shorter than the length indicated in the message's header. The shortened or truncated message must be at least the length of an Interprocess Message Switch (IMS) header (8 bytes), or else a READ TOO SHORT ERROR would be reported. If a READ FORMAT ERROR occurs with a broadcast message, only Ring Peripheral Controllers (RPCs) report the error so that the 3B20D/3B21D is not flooded with READ FORMAT ERROR reports. When a READ FORMAT ERROR occurs, the specific ring locality that triggered the problem is not identified by the error message. Ring communications are not stopped when this error occurs.

A Format 3 error message indicates that a threshold has been exceeded for the types of errors which are thresholded. Ring communications are not stopped when this error occurs.

A Format 4 error message indicates that ring communications have been disrupted and no Format 1 error messages that report ring communications disruption were received in the 3B20D/3B21D. EAR will initiate ring reconfiguration activity to restore a working ring (see Format 1 error message). Note that it is possible to have a two ring configuration (a normal ring) and experience loss of the token message on both rings, yet receive a Format 4 message for only one ring. Since almost all ring traffic occurs on Ring 0, Ring 0 is more likely to be reported than Ring 1 when this occurs. Also, when a single ring configuration exists (an isolated ring), there is only one token message present on the looped-back ring. Yet, it is possible to receive a Format 4 message specifying Ring 0, Ring 1, or Both Rings.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5 reports a node problem that is either internal (reporting node not given in report) or that is detected by another node. In the case of **RPC ISOLATION**, multiple ring faults elsewhere on the ring have caused this node to become isolated. It is presumed that the node itself is not faulty.

A Format 6 error message indicates that the Node Audit has detected a loss of ring messages. The Audit sends a ring message from the 3B, through a control RPC, around the ring, and back through the same control RPC to the 3B. If this message does not return, the audit checks the ring path through a second control RPC. If this second check also fails, this message is printed. If no second RPC is available, the Node Audit cannot differentiate between an RPC problem and a ring problem, so it assumes a ring problem and includes the ambiguity in the message.

A Format 7 error message indicates that the Node Audit has detected an intermittent loss of ring messages. This message is printed when approximately one-fourth of the audit ring messages are lost over a sample size of at least 12 messages or 36 seconds. This count is implemented with a leaky bucket.

A Format 8 error message indicates that a message has been removed from the ring due to a validation failure on the header portion of the message. This format will be reported only by Integrated Ring Node 2 (IRN2) equipped nodes. The IRN2 hardware provides capabilities for removing from the ring a message that does not pass a message header integrity check that is based on redundant bits within the message header. These capabilities will (1) prevent the writing of a badly formatted message and (2) prevent ring propagation of a message that is mutilated on the ring. In most occurrences of this error, the first two 32-bit hexadecimal words included with the Format [8] error report are the header of the message removed from the ring. Note, however, that the message header recovery process is such that the eighth byte of this data will be incorrect. If the reporting node was unsuccessful in including this message header in the error report, these two words will equal X'ffffff.

This error type will usually not disrupt ring communications other than the removal of the bad message. If the error occurs on a message being written to the ring, the error recovery process may cause other messages within the same block of messages to be lost. There are, however, two situations where ring disruption may accompany this type of error. First, if an IRN2 node detecting this type of error is immediately downstream from an Interframe Buffer, there is a small probability that the error recovery activities will cause ring disruption. If this occurs, EAR will react and provide ring recovery actions, typically through a level 0 recovery which will reestablish the ring configuration that existed before the error occurred. Secondly, faulty IRN2 hardware could trigger false error detection resulting in the removal of valid ring messages. An integrity check made in the 3B20D/3B21D on the removed messages will recognize this and trigger EAR to isolate the reporting node, usually via a level 3 recovery.

A Format 9 error message prints if Format [8] error messages occur at a high rate, error message buffers in the 3B20D/3B21D will be exhausted. When this occurs, Format [8] messages not printed on the Read Only Printer (ROP) are counted and reported as discarded messages in a Format [9] message. The Format [9] message is printed when exhausted error message buffers are once again available for recording Format [8] error messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a                      Type of error that has occurred:
- BLOCKAGE** — A node's blockage timer has timed out while waiting for a ring data byte transfer to the downstream node or Interface Bus (IFB) to occur. The node's blockage recovery action will drain the ring by reading all data from the ring, including the token message, into node processor memory. A **BLOCKAGE** Ring Transport Error Message is then sent to inform the 3B20D/3B21D of a ring problem somewhere downstream.
- BROADCAST-TAKE** — A checksum performed over the first six bytes of the message header indicated something was wrong.
- CONTROL CODE** — An integrity check on the control code portion of the message header failed.
- DEQUEUED TOKEN** — A non-RPC node reports this error if the token message is found in its ring receive buffers. It is intended to detect failures that cause a node to inadvertently read data from the ring.
- EXCESSIVE RING CMD INTERRUPTS** — This error, reported only by Integrated Ring Node (IRN) RPCs, is most likely due to a circulating hardware control message. In order to detect and recover from problems caused by certain types of circulating hardware control messages, ring command interrupts generated by hardware control messages are counted and thresholded. A leaky bucket thresholding technique is used to determine when the number of interrupts is excessive. When the ring command interrupt count reaches a threshold, the RPC takes a recovery action to halt and destroy any circulating hardware control messages. After the recovery action, this error is reported to the 3B20D/3B21D.
- GENERAL RAC ERROR** — A "catch all" error type used to report an unexpected node hardware or software condition. A node reporting this error will not accept ring data from its upstream node, thereby forcing the upstream node to detect blockage.
- HARDWARE COMMAND VIRTUAL DESTINATION ADDRESS** — A check on the destination node address within the message header of a non-broadcast ring interface hardware control message indicated that it was not a physical node address. All non-broadcast ring interface hardware control messages must have a physical destination address.
- HARDWARE COMMAND WRITE** — The writing of a ring interface hardware control message failed because the IRN2 node was not properly conditioned to write this kind of message.

SEE PROPRIETARY NOTICE ON COVER PAGE

**INTERFRAME BUFFER PARITY ERROR** — The upstream interframe buffer has detected a ring parity error. The IFB will not accept any more data, thereby forcing blockage in the node upstream from the IFB.

**MULTIPLE ERRORS** — The message was mutilated to the extent that more than one error was detected.

**MSG RELAY FAILURE** — This is very similar to the **RING WRITE FAILURE**. An RPC failed in relaying a message from the 3B20D/3B21D onto one of the rings during ring maintenance activity. This error will cause the RPC to be removed from service.

**NAUD CONTROL RPC FAILURE** — The node audit operation failed to pass ring traffic from the 3B through a given control RPC. A second control RPC did pass ring traffic, so the first RPC will be removed from service.

**NAUD FAILURE** — The node audit operation failed in one of its communication tests with a node. The node will be removed from service.

**NODE CKSUM ERROR** — The node checksum audit over a range of node memory failed. The node will be removed from service.

**NOT IDENTIFIED** — Either the header of the message removed from the ring was not included within the error message or none of the other valid error types were reported by the node in the error message.

**ORPHAN BYTE ERROR** — An "orphan byte" has been offered to the node. An orphan byte condition occurs when the node expects a control byte but the byte offered is not a control byte. The control byte is the first byte of data in an IMS message. A special signal lead on the ring bus is asserted only during the control byte, thereby allowing the receiving node to identify the control byte from all other message bytes.

**PIO FAILURE** — A Programmed IO operation at an RPC from the 3B20D/3B21D failed. This error will cause the RPC to be removed from service and isolated.

**RAC CONTROL FAILURE** — Control from the 3B20D/3B21D of an RPC's Ring Access Circuit (RAC) which is part of the ring interface circuit, failed. This error, which can only occur during ring maintenance activity, will cause the RPC to be removed from service.

SEE PROPRIETARY NOTICE ON COVER PAGE

- RAC OUTPUT PARITY ERROR — A node attempted to transmit bad parity to the downstream node or IFB. Since bad parity is not accepted by the downstream node or IFB, the transmitting node eventually detects blockage and reads the data with bad parity into memory as part of the blockage recovery process. Upon recognizing the bad parity, the transmitting node will take the same recovery action as is done with BLOCKAGE, except that this error is reported instead of BLOCKAGE.
- RAC PARITY ERROR — A ring data byte with bad parity has been offered to the node. Node recovery action could not clear the error and the upstream node will eventually detect blockage. The attempted recovery action is simply to resample the ring bus data to see if bad parity is still present. If bad parity is due to a transient error condition, this resampling operation should clear the error.
- RAC PARITY/ORPHAN BYTE ERROR — A node reporting this error will not accept data from its upstream neighbor, thereby forcing the upstream node to detect ring blockage. This message is reported when both a RAC PARITY ERROR and an ORPHAN BYTE ERROR have occurred on the same data byte.
- READ INHIBIT ERROR — Blockage occurred while receiving a message from the ring or while propagating a message and the operation to drain the ring did not complete as expected. The node will take the same recovery action as is done with BLOCKAGE.
- READ TOO SHORT ERROR — A partial message, shorter than an IMS header, has been detected on the ring at the reporting node. The partial message header is discarded.
- RING INTERFACE FAILURE — Ring maintenance activity found an RPC's ring interface to be faulty. This error will cause the RPC to be removed from service and isolated.
- RING READ FAILURE — An RPC failed in reading a message from the ring during ring maintenance activity. This error will cause the RPC to be removed from service.
- RING WRITE FAILURE — An RPC failed in writing a message to the ring during ring maintenance activity. This error will cause the RPC to be removed from service.
- RPC ISOLATION — An RPC was removed from service because it became isolated during ring reconfiguration. The RPC may or may not be an innocent victim.
- RPC PANIC — This is an "I give up" condition in the RPC Node software and will cause the RPC to be removed from service.

SEE PROPRIETARY NOTICE ON COVER PAGE

RPC STATE CHANGE FAILURE — The RPC failed to follow a 3B20D/3B21D directive to move into a particular software state during ring maintenance activity. This error will cause the RPC to be removed from service.

SOURCE MATCH — A ring message returned to the sending node because the destination node did not remove the message from the ring. The 3B20D/3B21D will remove the indicated destination node from service.

SRC MATCH — Essentially the same as the SOURCE MATCH error, described under Format 1, except the detection was made by the Node Audit (NAUD) operation.

TRANSIENT RAC ERROR — A ring data byte with bad parity was offered to the node and node recovery action (resampling the ring bus data) cleared the error. Had the error not been cleared, a RAC PARITY ERROR would have been reported. If this error occurs a predetermined number of times over a period of time, the node will be removed from service.

UNAUTHORIZED DETECTION — The reporting node detected and removed a message that the node was not authorized, through software control, to detect. A node must be authorized to detect the CONTROL CODE and BROADCAST-TAKE error types.

UNXPCTD SET QUAR — An RPC was unexpectedly put into quarantine.

VIRTUAL SOURCE ADDRESS — A check on the source node address within the message header indicated that it was not a physical node address. All ring messages must have a physical source address.

WRITE FORMAT ERROR — Some error occurred while a node was attempting to write a message to the ring. For example, the message may have had a source address that does not match that of the writing node, or the message specified an improper message length. A node reporting this error will not accept ring data from its upstream node, thereby forcing the upstream node to detect blockage. A major alarm sounds for this error type.

- b The name of the reporting node.
- c The RAC on which the error occurred (0-1).
- d A 32-bit word of internal information, passed by the reporting node, that is primarily intended for Lucent Technologies Bell Laboratories use.
- e The value of the 3B20D/3B21D Real Time Clock at the time the report is formatted. The Real Time Clock has a granularity of 1 millisecond. This is used to identify when the output message was issued relative to other output messages.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f The source of a message involved in a READ FORMAT ERROR. This is extracted from the header of the message read from the ring. The message header is given in the first two 32-bit words of internal information (d d) accompanying the READ FORMAT ERROR message. If the node could not recover the message that was read from the ring, these two words will be set to X'ffffffff and the source of the message, will be printed as ??.
- g The type of message involved in a READ FORMAT ERROR:  
BROADCAST  
NORMAL  
SEL BROADCAST  
TAKE  
If the node could not recover the message that was read from the ring, and ?? will be printed.
- h The ring where token message loss was discovered:  
RING 0 — Loss of the token message was observed on Ring 0.  
RING 1 — Loss of the token message was observed on Ring 1.  
BOTH RINGS — Loss of the token message was observed on both rings.
- i The name of the defective node which, in some cases, is also the reporting node.
- j The number of error reports discarded (not printed on the ROP).

#### 4. ACTION TO BE TAKEN

A minor alarm sounds with all forms of this message.

A major alarm sounds for the WRITE FORMAT ERROR error type.

Format 1:

Except for the TRANSIENT RAC ERROR and SOURCE MATCH errors, ring configuration activity will be initiated to reestablish a working ring. Either the configuration that existed before the error(s) occurred will be reestablished, or one or more nodes will be isolated. Refer to the REPT:RING-CFR output message that will accompany the Format 1 error message(s).

When a node or nodes are isolated, Automatic Ring Recovery (ARR) will schedule diagnostics on the isolated node(s) to verify the presence of a problem. When the diagnostic result is ATP, or the original ring configuration was successfully established following the errors, the Format 1 error messages should be logged for future reference. The failure may have been caused by a transient hardware problem or a software fault. However, hardware causing intermittent ring failures can sometimes be identified by pattern matching Format 1 error messages over multiple failure events. Similarly, the TRANSIENT RAC ERROR, which does not stop ring communications, may identify

SEE PROPRIETARY NOTICE ON COVER PAGE

intermittent hardware problems when patterned over multiple failure events. The **SOURCE MATCH ERROR** will cause a node to be removed from service. When diagnostics run on such a node go ATP, it is difficult to determine whether a hardware or software fault caused the problem.

Format 2:

The **READ FORMAT ERROR** report does not implicate the reporting node. It is likely that a ring message was truncated somewhere between the **MSG SRC** node reported in the error message and the node reporting the error. Logging these error reports and pattern matching over multiple failure events can sometimes lead to identifying problem hardware.

Format 3:

The node will be removed from service and **ARR** will schedule diagnostics to be run. If the diagnostic result is ATP, **ARR** will restore the node to service. A ring hardware problem should be suspected on repeated Format 3 failures, even if the diagnostics run ATP.

Format 4:

As with the Format 1 error messages, ring configuration activity will be initiated to reestablish a working ring. Either the ring configuration that existed before the **UNEXPLAINED LOSS OF TOKEN** occurred will be reestablished, or a level 3 **EAR** recovery will perform ring communications tests to find and establish a working ring. Refer to the **REPT:RING-CFR** Output Message that will accompany the **UNEXPLAINED LOSS OF TOKEN** error. Also, the **REPT:TOKEN-TRACK** Output Message, which will accompany the **UNEXPLAINED LOSS OF TOKEN** error, may be useful for identifying the location on the ring where the token message was lost.

Format 5:

The defective or debilitated node is removed from service without reconfiguring the ring. **ARR** will schedule diagnostics on this node to determine the nature of the problem. In cases where the diagnostic goes ATP, it is difficult to determine whether a hardware or software fault caused the problem. As with the Format 1 error reports, logging the report may be useful in future pattern matching to identify weak hardware. In the case of **RPC ISOLATION**, no diagnostics will be run. **ARR** will unconditionally restore the node once the isolation surrounding it is cleared.

Format 6:

A level 3 **EAR** recovery will perform ring communications tests to find and establish a working ring.

Format 7:

A level 3 **EAR** recovery will perform ring communications tests to find and establish a working ring.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 8 and 9:

Most occurrences of this error can be due to either hardware or software failure. The message removed from the ring may have been mutilated by software before it was written to the ring, by node hardware while writing it onto the ring, or by hardware after the message was written onto the ring. The node reporting the error is not necessarily the node that injected the problem, although it could be in the situation where a node removed a badly formatted message that it was attempting to write onto the ring. Thus, it is difficult to provide specific recommendations on actions to be taken when this error occurs. In general, if the error is being reported by multiple nodes, software problems are likely to be the root cause. Otherwise, either hardware or software failure may be at fault.

The UNAUTHORIZED DETECTION failure type will also trigger EAR to fault and isolate the reporting node. Here, it is difficult to say whether hardware or software failure is the root cause of the problem. Finally, software in the 3B20D/3B21D will examine the message header removed from the ring to verify the validity of the hardware detected error. Rare node hardware failure could trigger false error detection that results in removal of good messages from the ring. The verification step will recognize this type of hardware failure and trigger EAR to fault and isolate the node.

- 14 — Error encountered while attempting to send a message to CNI on the channel.
- 15 — Cannot read a message due to channel problems.
- 16 — Exceeded maximum returned messages allowed from the channel.
- 17 — Exceeded allowed tries to open channel.
- 18 — Cannot send CI\_BEGIN message.
- 19 — Timed out while waiting for cL\_RPTSDN message.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 4 prints out the values of the error array and RINGINIT's state via a text string and a numerical value.

REPT RINGINIT STATE STARTING (0) FAILED e TIMES  
Initial state.

REPT RINGINIT STATE GETLVL (1) FAILED e TIMES  
Getting latest UNIX® RTR level.

REPT RINGINIT STATE ABT\_CNI0 (2) FAILED e TIMES  
Sending E\_ABORT event to CNIINIT.

REPT RINGINIT STATE ABT\_CNI1 (3) FAILED e TIMES  
Cleaning up CNI/IMS processes.

REPT RINGINIT STATE TELL\_DLNCM (4) FAILED e TIMES  
Sending message to DLNCM about starting CNI initialization.

REPT RINGINIT STATE WT\_DLNCM (5) FAILED e TIMES  
Waiting for response from DLNCM about starting CNI initialization.

REPT RINGINIT STATE CRT CNI (6) FAILED e TIMES  
Creating CNIINIT.

REPT RINGINIT STATE WAIT\_BEGIN (7) FAILED e TIMES  
Waiting for CI\_BEGIN message from CNIINIT.

REPT RINGINIT STATE SEND\_REQUEST (8) FAILED e TIMES  
Sending CNIINIT CI\_REQUEST message.

REPT RINGINIT STATE WAIT\_COMP (9) FAILED e TIMES  
Waiting for CI\_COMPLETE message from CNIINIT.

REPT RINGINIT STATE SEND\_BEGIN (10) FAILED e TIMES  
Sending CNIINIT CI\_BEGIN message.

REPT RINGINIT STATE WAIT\_LVL1 (11) FAILED e TIMES  
Waiting for CI\_COMPLETE on a LVL 1.

REPT RINGINIT STATE OPEN\_CHAN (12) FAILED e TIMES  
Attempting to open channel.

REPT RINGINIT STATE WAIT\_DONE (13) FAILED e TIMES  
Waiting for DLNCM to acknowledge message about end of CNI initialization.

REPT RINGINIT STATE APPLIN (14) FAILED e TIMES  
Sending cL\_APPLIN message.

REPT RINGINIT STATE WAIT\_DATAIN (15) FAILED e TIMES  
Waiting for cL\_DATAIN message.

SEE PROPRIETARY NOTICE ON COVER PAGE

REPT RINGINIT STATE STARTCOM (16) FAILED e TIMES  
Sending cL\_STRTCOM message to CNI.

REPT RINGINIT STATE TRAFMANG (17) FAILED e TIMES  
Receiving messages from CNI/IMS.

REPT RINGINIT STATE RDY\_STATE (18) FAILED e TIMES  
Sending RIREADY to DLNCM.

REPT RINGINIT STATE SOCITOME (19) FAILED e TIMES  
Sending cL\_SOCITOME to CNI/IMS.

REPT RINGINIT STATE GO\_TRAF (20) FAILED e TIMES  
Sending RITRAF\_STRT to DLNCM.

REPT RINGINIT STATE WAIT\_TRACK (21) FAILED e TIMES  
Waiting for acknowledgment from DLNCM.

REPT RINGINIT STATE FINISHUP (22) FAILED e TIMES  
Processing the rest of a long CNI/IMS message.

REPT RINGINIT STATE ALLSYSGO (23) FAILED e TIMES  
Once an hour entry.

REPT RINGINIT STATE READMSGs (24) FAILED e TIMES  
Reading messages from CNI/IMS.

REPT RINGINIT STATE QUIET (25) FAILED e TIMES  
In the QUIET mode, no longer attempting automatic recovery.

REPT RINGINIT STATE WAITTOKILL (26) FAILED e TIMES  
Waiting to clean up CNI/IMS processes.

Format 5 indicates that RINGINIT is no longer attempting automatic recovery.

**NOTE:** In cases where the suggested action is to initialize the ring, repeated failures will require other action.

REPT RINGINIT QUIET REASON AIM\_REQUEST (0)  
Check output from AIM to see why AIM requested the QUIET mode.

REPT RINGINIT QUIET REASON PROCESS\_MNG (1)  
Verify if the path name of CNIINIT is correct. If it is, seek technical assistance.

REPT RINGINIT QUIET REASON NEG\_START\_DLNCM (3)  
Check output from DLNCM.

SEE PROPRIETARY NOTICE ON COVER PAGE

REPT RINGINIT QUIET REASON NO\_DLNCM (5)  
Create the process DLNCM.

REPT RINGINIT QUIET REASON WT\_START\_DLNCM (6)  
Check output from DLNCM.

REPT RINGINIT QUIET REASON TOO\_MANY\_ABORTS (7)  
Determine why CNIINIT is aborting (which probably requires determining why imsdrv is aborting) then INIT:RING {2|3|4}.

REPT RINGINIT QUIET REASON BAD\_PORT (8)  
Seek technical assistance.

REPT RINGINIT QUIET REASON NO\_COMPLETE (9)  
INIT:RING {3|4}.

REPT RINGINIT QUIET REASON BAD\_RI\_STATE (11)  
INIT:RING {0|1}.

Format 6 indicates that RINGINIT took a fault while running; b is the fault code (See UNIX® RTR header file fault.h).

Format 7 indicates that RINGINIT is stepping through its escalation sequence; k indicates the step, s is a string of information about what is occurring.

```
REPT RINGINIT ESC STEP 1 SW CU

| s | String for a RINGINIT condition. See expansion under the formats.              |
| b | Supplementary data for channel problem (See Format 3).                         |
| c | String giving RINGINIT's state (See Format 4).                                 |
| d | Numeric value of RINGINIT's state (See Format 4).                              |
| e | Number of times a given RINGINIT state failed.                                 |
| f | Level of initialization that is occurring.                                     |
| h | Cause of RINGINIT entering the QUIET mode (See Format 5).                      |
| i | Numeric value of the cause of RINGINIT entering the QUIET mode (See Format 5). |
| k | Indicates the step (See Format 7).                                             |
| l | Numeric time the ring required for initialization.                             |

SEE PROPRIETARY NOTICE ON COVER PAGE

**4. ACTION TO BE TAKEN**

Initialize the ring, or seek technical assistance.

## 1. FORMAT

- [1] REPT RMF a
- [2] REPT RMF 3 [b]
- [3] REPT RMF {9|10} [c]
- [4] REPT RMF 11 [d]
- [5] REPT RMF 12 [e]

## 2. REASON FOR OUTPUT

To report that the Recovery Message Formatter (RMF) encountered an error condition while attempting to output an error or postmortem recovery message.

Format 2 prints for Error code 3 which is the condition of the plant measurement library could not be opened.

Format 3 prints for Error code 9 or 10 which is the condition of could not open intermediate file to spool message, OR could not spool intermediate file.

Format 4 prints for Error code 11 which is the condition of a spooled orphaned intermediate file.

Format 5 prints for Error code 12 which is the condition of a bad interrupt type read from erslot.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code specifying the error condition detected:
- 1 — Premature End Of File (EOF) detected on /dev/pmem.
  - 2 — File /dev/pmem could not be opened.
  - 3 — Plant measurement library could not be opened.
  - 4 — Could not attach to plant measurement database.
  - 5 — Could not retrieve plant measurement record.
  - 6 — Could not update plant measurement record.
  - 7 — Seek error on file /dev/pmem.
  - 8 — Read error on file /dev/pmem.
  - 9 — Could not open intermediate file to spool message.
  - 10 — Could not spool intermediate file.
  - 11 — Spooled orphaned intermediate file.
  - 12 — Bad interrupt type read from erslot.

SEE PROPRIETARY NOTICE ON COVER PAGE

- b Error code returned by `plib` call. Printed only if a premature EOF was detected.
- c Output Message Database (OMDB) key of the postmortem dump or error slot which could not be spooled.
- d Sequence number of the post-mortem dump or error logfile "presumed to have been orphaned" that will be spooled. The contents of the logfile will be appended to one of the system logfiles (ERLOG, MEMLOG, PMLOG) and printed on the Receive-Only Printer (ROP). The information in the logfile may be a duplication of information already spooled and likely not current.
- e Data printed for error may be incorrect.

#### **4. ACTION TO BE TAKEN**

None.

- [7] REPT RMTGETTY UNABLE TO RETRIEVE LCHAN FROM ENVIRONMENT
- [8] REPT RMTGETTY UNABLE TO RETRIEVE TERMINAL OPTIONS FROM APH
- [9] REPT RMTGETTY CANNOT READ LOGDEV RECORD FOR d

## 2. REASON FOR OUTPUT

To inform the craftsperson that the RMTGETTY process has encountered an error while trying to process initialization information for a device. This message will appear on the originating device only.

## 3. VARIABLE FIELD DEFINITIONS

- a Teletypewriter (TTY) device against which the RMTGETTY is executing.
- b The directory which the RMTGETTY could not access.
- c Pathname of the process to be executed.
- d Special device file for which the problem occurred.

## 4. ACTION TO BE TAKEN

If Format 1 or 2 is printed, verify that the getty record in the Equipment Configuration Database (ECD) for the indicated TTY device is correct.

If Format 3 is printed, verify that the directory indicated in the getty record exists.

If Format 4 is printed, verify that the process which could not be executed exists and is executable.

SEE PROPRIETARY NOTICE ON COVER PAGE

If Format 5, 6, 7, 8, or 9 is printed, or the errors persist after taking actions indicated, seek technical assistance.

## **5. REFERENCES**

OMDB Key

There is an OMDB key of 312.

ID ..... REPT:ROP  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT ROP a {ERROR b [c] [COMPL CODE d] |  
UNIDENTIFIED RESPONSE WD1=e WD2=f}
- [2] REPT ROP a STARTED
- [3] REPT ROP a STOPPED

## 2. REASON FOR OUTPUT

Format 1 reports a Receive-Only Printer (ROP) related software or hardware error.

Format 2 reports that the ROP has changed state from Standby (STBY) to Active (ACT). A ROP will change to ACT state when Data Terminal Ready (DTR) is ON.

Format 3 reports that the ROP has changed state from ACT to STBY. A ROP will change to STBY state when DTR is OFF.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies, in hexadecimal notation, the point within the Input/Output Driver (IODRV) where a software or hardware error was detected. See IOP Output Appendix F, APP: IOP-F.
- c Character string giving more information about the error identified in b. Refer to IOP Output Appendix F, APP: IOP-F for additional explanation.
- d Hardware error type, in hexadecimal notation. See IOP Output Appendix A, APP: IOP-A.
- e First word of an unidentified completion report.
- f Second word of an unidentified completion report.

## 4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the ROP has changed states. These messages are output when the currently active ROP changes state to STBY, and the currently standby ROP changes state to ACT. An active ROP will change state to STBY

SEE PROPRIETARY NOTICE ON COVER PAGE

when powered off, and a standby ROP will change state to ACT when powered up. No action is necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:RPC-STAT  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

- [1] REPT RPC STAT ALM  
ZERO RPCS! ACCESS TO CCIS NETWORK LOST!  
RECOVERY REQUIRES MANUAL ACTION!
- [2] REPT RPC STAT ALM  
WARNING:ONLY ONE ACTIVE RPC REMAINING

## 2. REASON FOR OUTPUT

The first message is output automatically when all ring peripheral controllers (RPCs) have been removed and, consequently, there is no access to the Common Channel Interface Signaling (CCIS) network.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

Format 1 is a critical message and requires immediate manual action as follows:

- I. Attempt to recover and restore a single RPC.
  - A. If possible, try to determine which RPC would be most easily restored and restore that one first; getting one RPC back to a normal working state is CRITICAL!
- II. Make the following checks on link status and system state.
  - A. For CCIS6 (i.e., 2.4, 4.8 KB) links, conduct the following checks and take steps if necessary:
    - a. Take corrective action to insure restoral of any down mate-links.
    - b. If an emergency restart exists, follow necessary procedures to facilitate recovery.
  - B. For CCS7 (i.e., - 56 KB) links, make the following checks and take steps if necessary:
    - a. Take corrective action to insure restoral of any down mate-links.
    - b. If a link-set failure exists, follow necessary procedures to facilitate recovery.
    - c. If a combined-link-set failure exists, follow necessary procedures to facilitate recovery.

SEE PROPRIETARY NOTICE ON COVER PAGE

- III. Once steps (I) and (II) have been followed, proceed as in (I) and restore the remaining RPCs by attempting to recover first those RPCs that appear to be most easily recoverable (i.e., almost normal state).

Format 2 message is output when the system has only (1) remaining RPC. It is essential that this condition be cleared as soon as possible. Loss of the last RPC will result in a CCS signaling outage.

## **5. REFERENCES**

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:RST-RPC-ERR  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

This message has two formats:

- [1] REPT RST RPC ERR  
TIME OUT IN RST RPCNx 0, ISTATE = a, jobst = b, \_RML3RST = c
- [2] REPT RST RPC ERR  
PUMPER NOT AVAILABLE WHEN RESTORING RPCNx 0

## 2. REASON FOR OUTPUT

Format 1: An RPC restore job has been aborted by the driver. The RPC restore job may be part of a boot or a manual restore initiated by the user.

Format 2: Pumper is not available during a single RPC restore.

## 3. VARIABLE FIELD DEFINITIONS

- x A Ring Node (RN) group number (00-63).
- a Internal state when the job was aborted.
- 0 — Unknown state.
  - 1 — DMAC has been initialized, 3BI and D2SBS have been reset, interrupt has been attached (but not enabled yet). The node processor of an RPC is being reset.
  - 2 — Node processor reset is done.
  - 3 — The maintenance channel between RPC and 3B is ready while the Node processor is in the ROM mode.
  - 4 — Program downloaded.
  - 5 — Download started.
- b The job state.
- 0 — No job.
  - 3 — Waiting for 3BI interrupt.
  - 6 — Waiting for NP execute response.
  - 8 — Waiting for pumper to acknowledge.
  - 12 — Waiting for node processor to interrupt.
- c RPC.MTCE mode indicator (debugging purpose).
- 0 — RPC.MTCE is neither in the level 3 restart mode nor in the level 3 restore mode.
  - 2 — RPC.MTCE is in the level 3 restart mode.
  - 4 — RPC.MTCE is in the level 3 restore mode.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

Format 1: Run diagnostics to see if there is any problem with the hardware. Check to see whether the RPC ROM code is good. Check to see that the RPC RAM load is good.

Format 2: If the restore was a manual request, wait a little while before retrying the job. Pumper may be recreated.

## 1. FORMAT

This message has two output formats:

- [1] REPT RSTRT RPC ERR  
PIO CMD a IN RSTRT RPC FAILED, RPCNx 0
- [2] REPT RSTRT RPC ERR  
CHANNEL INIT FAILED WHEN RESTART RPCNx 0

## 2. REASON FOR OUTPUT

Format 1: In restarting a ring peripheral controller (RPC), a program I/O is sent to the Node processor of an RPC after the channel is properly reinitialized. The RPC restart is part of RPC fault recovery action.

Format 2: The initialization of the DMA channel failed during the restart of an RPC. Usually a message of the format REPT:RPC-INIT will accompany this message to pinpoint the reason.

## 3. VARIABLE FIELD DEFINITIONS

- x A Ring Node (RN) Group Number (00-63).
- a The program I/O command, (in hex format):
  - 2e — Restart an RPC by reinitializing RTX.
  - 26 — Command an RPC to retry a 3B DMA.
  - 36 — Command an RPC to clear a 3B DMA.

REPT RUSDG :a

## 2. REASON FOR OUTPUT

To report a system error in the interprocess communication of the rusdg process. The rusdg process interfaces with the performance measurement processes at kernel level.

## 3. VARIABLE FIELD DEFINITIONS

a                      Error message:

                        pcreat failure - Cannot execute performance measurement kernel process.

                        sendw failure - Cannot send message to performance measurement kernel process.

                        interval defaulted to 1 sec - Minimal interval is one second.

## 4. ACTION TO BE TAKEN

None.

TYPE ..... Output

## 1. FORMAT

REPT RUSDKERN: a

## 2. REASON FOR OUTPUT

To report the status of the 3B DMERT processor handling of RUSDKERN, a kernel process that collects the performance measurements when the input message OP:PERFMEAS is entered.

## 3. VARIABLE FIELD DEFINITIONS

a                      Status of RUSDKERN process:

- Performance measurements started.
- Performance measurements completed.
- Message returned from termination request.
- Unexpected message received.
- Return message from unexpected source.
- Error in the creation or option message not received.
- QueueM failed in close attempt.
- QueueM of writeseg failed.
- QueueM of aps message failed.

- [13] REPT RUTIL NO ROOM FOR MORE MESSAGES
- [14] REPT RUTIL CAN'T WAKEUP RGP\_PRT
- [15] REPT RUTIL LNuu v NO RESPONSE w

## 2. REASON FOR OUTPUT

All formats report an error condition encountered by the RGRASP RGP\_KER process.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format [1] indicates a byte count error in a request to print an output message.

Format [2] indicates that the kernel failed to attach to a port.

Formats [3], [4], and [5] indicate error return codes from the calls to clalive(), clstart(), and clstop(), respectively.

Formats [6] and [7] indicate that the RGRASP RGP\_KER process is terminating.

Format [8] indicates that the RGRASP RGP\_KER has been faulted by the operating system.

Format [9] indicates a message was returned to the RGP\_KER from the node.

Format [10] indicates that the RGP\_PRT port is invalid.

Format [11] indicates that the RGP\_PRT port is not connected.

Format [12] indicates a node response block error.

Format [13] indicates that no space is left to store node response messages.

Format [14] indicates the RGP\_KER process could not wake up the RGP\_PRT process.

Format [15] indicates that no response was received from the node.

### 3. VARIABLE FIELD DEFINITIONS

|    |                                           |
|----|-------------------------------------------|
| a  | Byte count.                               |
| b  | Port number.                              |
| c  | Process id.                               |
| d  | Return code from clalive() function call. |
| e  | Return code from clstart() function call. |
| f  | Return code from clstop() function call.  |
| g  | Fault code.                               |
| h  | Program address.                          |
| i  | Processor status word.                    |
| j  | Process entry code.                       |
| m  | Previous process state.                   |
| n  | Event flags.                              |
| q  | Register values.                          |
| uu | Link node group number.                   |

## 4ESS™/APS Input/Output Message Manual Comment Form

Lucent Technologies opinion. We would like to know how well this document meets your needs. Please check the appropriate column to indicate your opinion of the document for the categories listed on the right, and answer the questions following the table. Your comments will help us improve future issues. Thank you in advance for taking the time to fill out this form.

Generic: 4AP20

Issue: 9.4

|              | Excellent | Good | Fair | Poor |
|--------------|-----------|------|------|------|
| Ease of Use  |           |      |      |      |
| Accuracy     |           |      |      |      |
| Completeness |           |      |      |      |

ID ..... REPT:SCC  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT SCC a {ERROR b [COMPLETED CODE c] |  
UNIDENTIFIED RESPONSE WD1=d WD2=e}
- [2] REPT SCC a STARTED
- [3] REPT SCC a STOPPED
- [4] REPT SCC a WARNING LAST LINK IN DUPLEX LINK GROUP  
BEING REMOVED

## 2. REASON FOR OUTPUT

Format 1 reports a Switching Control Center (SCC) related software or hardware error.

Format 2 reports that the SCC has changed state from Standby (STBY) to Active (ACT). An SCC will change to ACT state when the level 2 connection is established, the data link is in information transfer state, and the other SCC is not in the ACT state.

Format 3 reports that the SCC has changed state from ACT to STBY. An SCC will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

Format 4 reports that the last available link in a duplex link group is being removed from service.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies, in hexadecimal, the point within the Input/Output Driver (IODRV) where a software or hardware error was detected. See Input/Output Processor (IOP) Output Appendix F, APP:IOP-F.
- c Hardware error type, in hexadecimal. See IOP Output Appendix A, APP:IOP-A.
- d First word of an unidentified completion report.
- e Second word of an unidentified completion report.

## 4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

SEE PROPRIETARY NOTICE ON COVER PAGE

Formats 2 and 3 are informational messages and indicate that the SCC has changed states. These messages are output if a problem is sensed on the active SCC. The AM will then initiate recovery on the SCC with a problem, and start the mate SCC by changing its state from STBY to ACT.

Format 4 indicates that no data transmission can take place over the link facility due to the removal of the last available link in a duplex link group. One of the links in the group should be repaired and then restored to service.

TYPE ..... Output

## 1. FORMAT

The following messages will be printed when an MTP user that is sending periodic User Part Check-In (UPCKIN) messages to SCCP has stopped sending them. Note that a critical alarm is associated with the first two messages.

[1] [ SCCP detects user has stopped sending UPCKIN messages ]

REPT SCMG

WARNING: SETTING USER PART a OUT OF SERVICE

[2] [ User has not yet responded with UPCKIN messages ]

REPT SCMG

WARNING: a IS OUT OF SERVICE

[3] [ User has resumed sending UPCKIN messages ]

REPT SCMG

a NOW BEING MARKED IN SERVICE

## 2. REASON FOR OUTPUT

Format 1: SCCP has stopped receiving UPCKIN messages from the MTP user and has marked the subsystem number (SSN) corresponding with this user out-of-service.

Format 2: The MTP user has not resumed sending the UPCKIN messages in the last 5 minutes and the SSN is still marked out-of-service.

Format 3: MTP user has resumed sending periodic UPCKIN messages to SCCP.

## 3. VARIABLE FIELD DEFINITIONS

a MTP user  
(ISDN-UP or TUP or service indicator of MTP user (from SIO field))

## 4. ACTION TO BE TAKEN

Determine why MTP user is failing to send UPCKIN messages.

## **2. REASON FOR OUTPUT**

Prints in response to a menu driven display page. (MCC Display Page #1200, SCS SOFTWARE UPDATE)

Formats 19 and 37 are normal operational output messages.

The remaining formats indicate that an error has occurred and an explanation of the error.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                    |
|---|----------------------------------------------------------------------------------------------------------------------------------------------------|
| a | The /etc/log/1bperfsu/Ustep.data or /etc/log/1bperfsu/Cstep.data file.                                                                             |
| b | The number of the last step to be completed. A list of steps and a short description can be found in the <i>SCS Software Update User's Guide</i> . |
| c | The first 15 characters of the message to be sent to the 1B.                                                                                       |
| d | The member number of the Service Circuit System (SCS) frame to use the tool on.                                                                    |
| e | The name of the file on which an error occurred either on opening, reading or creating.                                                            |
| f | Error number. In the source code, search for ERROR g (i.e. ERROR 01) to find the exact location of this error.                                     |
| g | The number of the step that is to be executed next, but only if all previous steps have completed successfully.                                    |
| h | The number of the 1A file.                                                                                                                         |
| i | The type of error which occurred.                                                                                                                  |
| j | The name of the file which caused the error.                                                                                                       |
| k | The number of the error.                                                                                                                           |
| l | Number of the generic.                                                                                                                             |
| m | Address in octal.                                                                                                                                  |

### 4. ACTION TO BE TAKEN

For formats 2-4, 6, 12, 23, 27, 32, 34-36, and 38, fix the error and reenter the command.

For all other formats except 19, 28, 37, and 40, seek technical assistance.

GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT SCSDA FAULT CODE a [VIRTUAL ADDRESS b]
- [2] REPT SCSDA ERROR CODE c [UNIT d] [PID e [UID f]] [RID g] [FAULT CODE a]
- [3] REPT SCSDA UNIDENTIFIED MESSAGE FROM e TYPE h

## 2. REASON FOR OUTPUT

To report the occurrence of either a Scanner and Signal Distributor (SCSD) Administrator (SCSDA) related software error, or of an abnormal event.

Format 1 reports the receipt of an SCSDA fault code. (A message with supplemental data may accompany this report.)

Format 2 reports an SCSDA error.

Format 3 reports the receipt of an unrecognized message sent to the SCSDA.

## 3. VARIABLE FIELD DEFINITIONS

- a Fault code. See Disk File Controller (DFC) Output Appendix I, APP:DFC-I.
- b Virtual address, in hexadecimal, where the fault occurred within the SCSDA.
- c SCSDA error code, in hexadecimal:
  - 50 — SCSDA cannot process request. Unit is unknown.
  - 51 — Unrecognized fault code.
  - 52 — Received notification that client process has terminated. Reason for termination is unknown.
  - 53 — Message overload condition exists for an SCSDA client process.
  - 54 — Cannot initialize an unit.
  - 55 — SCSDA is in an improper state to process the request.
- d Unit number of SCSDC, in decimal.
- e Process number of SCSDA client, in decimal.
- f Utility Identification (ID) number of SCSDA client, in hexadecimal.
- g Record Identification (RID) of SCSDC, in hexadecimal.
- h Unrecognized message type, in hexadecimal.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### 4. ACTION TO BE TAKEN

If Format 1 is output or the SCSDA error is 51, collect Receive-Only Printer (ROP) and forward to the service support organization for all fault types.

Error type 50 is caused by either corruption of the SCSDA unit save area or the maximum number of SCSDC units that can be monitored by the SCSDA has been exceeded. Enter into the Equipment Configuration Database (ECD) to verify that the unit is equipped and the RID was not corrupted in the memory of the SCSDA. If the RID is not corrupted and the maximum number of SCSDC units by the SCSDA has not been exceeded, regrow the SCSDC unit. In either case, report that an error has occurred to the service support organization.

For error 52, restart the terminated client process if its Utility Identification (UID) is reported and if it was not automatically restarted. If the UID is not reported, then the process with Process Identification (PID) is not known to the SCSDA. The process no longer exists. If this error persists, contact the service support organization.

Error 53 indicates that an SCSDA client is no longer processing messages, or has received too many messages at one time before it can dequeue them. This error indicates that the client has exceeded the maximum number of allowable messages on its queue and returned the message to the SCSDA. In either case, the conditions result with incomplete information because these messages have been returned to the SCSDA and are not re-sent. If this error persists, take corrective action, such as restarting the client process, and contact the service support organization.

Error 54 verifies that the unit is in-service. Correct as required.

Error 55 will be corrected by the SCSDA and additional action is not required. The SCSDA will re-initialize the unit.

## 4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Format 2, no action is necessary unless the controller is not acting normal, or cannot be restored. Contact service organization with the flash RAM version number that was used.

ID ..... REPT:SDL  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT SDL a { [ERROR] {b|c} [d] [COMPL CODE e] |  
UNIDENTIFIED RESPONSE WD1=f WD2=g }
- [2] REPT SDL a WARNING LAST LINK IN DUPLEX LINK GROUP  
BEING REMOVED
- [3] REPT SDL a STARTED
- [4] REPT SDL a STOPPED

## 2. REASON FOR OUTPUT

Format 1 reports a Synchronous Datalink (SDL) related software or hardware error or an unauthorized attempt to use a secure dial-up data link.

Format 2 reports that the last available link in a duplex link group is being removed from service.

Format 3 reports that the SDL has changed state from Standby (STBY) to Active (ACT). An SDL will change to ACT state when the level 2 connection is established, and the data link is in information transfer state.

Format 4 reports that the SDL has changed state from ACT to STBY. An SDL will change to STBY state when the level 2 connection is terminated, and the level 1 connection remains established.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies the point, in hexadecimal, within the Input/Output Driver (IODRV) where a software or hardware error was detected. See Input/Output Processor (IOP) Output Appendix F, APP:IOP-F.
- c Identifies which security check failed in an attempt to use a secure dial-up link:
  - INCORRECT PASSWORD
  - INCORRECT PASSWORD DESTINATION ADDRESS LENGTH
  - INCORRECT PASSWORD DESTINATION IDENTIFICATION
  - INCORRECT PASSWORD LINK IDENTIFICATION

SEE PROPRIETARY NOTICE ON COVER PAGE

- INCORRECT PASSWORD MODIFIER
  - INCORRECT PASSWORD ORIGINATION ADDRESS LENGTH
  - INCORRECT PASSWORD ORIGINATION IDENTIFICATION
  - INSUFFICIENT PASSWORD INFORMATION
  - PASSWORD NOT REQUIRED INHIBITED
  - PASSWORD PACKET NOT RECEIVED
  - PASSWORD REQUIRED
  - PASSWORD TEST BIT ON
  - PASSWORD VALID INHIBITED
  - UNKNOWN PASSWORD MODIFIER 2
  - UNKNOWN PASSWORD MODIFIER 7
  - UNKNOWN PASSWORD MODIFIER 10
  - UNKNOWN PASSWORD MODIFIER 11
  - UNKNOWN PASSWORD MODIFIER 15
- d Character string giving more information about the error, in hexadecimal. Refer to IOP Output Appendix F, APP:IOP-F for additional explanation.
- e Hardware error type, in hexadecimal. See IOP Output Appendix A, APP:IOP-A.
- f First word of an unidentified completion report.
- g Second word of an unidentified completion report.

#### 4. ACTION TO BE TAKEN

For format 1, the software or hardware error messages indicate error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Or format 1 indicates the unauthorized attempt to use a secure dial-up link message by someone who is not authorized access to the computer system through a synchronous data link. Notify the person in charge of security for the computer system.

For format 2, removal of the last available link in a duplex link group indicates that no data transmission can take place over the link facility. One of the links in the group should be repaired and then restored to service.

Formats 3 and 4 are informational messages and indicate that the SDL has changed states. No action is necessary.

SEE PROPRIETARY NOTICE ON COVER PAGE

## 1. FORMAT

- [1] REPT SDL24MON DATA LINK IN USE BY PID=c
- [2] REPT SDL24MON FAILED TO CONNECT TO PORT, ERRNO=e
- [3] REPT SDL24MON OPEN FAILED, ERRNO=e
- [4] REPT SDL24MON READ FAILED, ERRNO=e
- [5] REPT SDL24MON RCAS NOT IMPLEMENTED YET
- [6] REPT SDL24MON KEY WORD NOT RECEIVED
- [7] REPT SDL24MON FAILED TO START PROCESS: p

## 2. REASON FOR OUTPUT

These messages are output when the sdl24mon process receives an error condition while trying to access the SDL 24 data link and then trying to start the sodad process (slave odad).

Format 1 indicates that the SDL 24 datalink is already in use by the process given by the pid.

Format 2 is output if there is a failure when sdl24mon tried to connect to port PT\_ODAD (149).

Format 3 indicates that sdl24mon failed to open /dev/odad.

Format 4 indicates that sdl24mon failed to read from the device /dev/odad.

Format 5 is output when RCAS keyword is received on the device which is not implemented at this point.

Format 6 is output when the keyword to identify application (ODAD or RCAS) is not received on the device.

Format 7 indicates that sdl24mon failed to start the application process denoted by the name p (ODAD or RCAS).

## 3. VARIABLE FIELD DEFINITIONS

- [7] REPT SHLGETTY FAILED TO OPEN e
- [8] REPT SHLGETTY UNABLE TO RETRIEVE LCHAN FROM  
ENVIRONMENT

## 2. REASON FOR OUTPUT

To report a failure that occurred during shlgetty process execution.

## 3. VARIABLE FIELD DEFINITIONS

- a Teletypewriter (TTY) device which shlgetty is executing against.
- b UNIX® RTR error code. See System Error Codes Output Appendix, APP:SYSERR.
- c The idir file suffix entry CFTSHL executing directory.
- d Pathname of the process which could not be executed.
- e Special device file which could not be opened.

## 4. ACTION TO BE TAKEN

If Format 1, 2, 3, or 4 is printed, verify that the getty and ttopt records in the Equipment Configuration Database (ECD) for the indicated TTY device are correct.

If Format 5 is printed, check that the directory indicated in the getty record exists.

If Format 6 is printed, verify that the process which could not be created exists and is executable.

SEE PROPRIETARY NOTICE ON COVER PAGE

If Format 7 or 8 is printed, or the error persists after taking action indicated, seek technical assistance.

## 1. FORMAT

REPT SIM UTILITY IDS OF PROCESSES KILLED DURING CFT INIT  
a a a a a a a a a

## 2. REASON FOR OUTPUT

To report the utility Identifications (IDs) of processes killed during a level 2 or level 3 craft initialization.

## 3. VARIABLE FIELD DEFINITIONS

a Utility ID in hexadecimal of a killed process.

## 4. ACTION TO BE TAKEN

This message lists the utility IDs of processes killed during a craft initialization. To identify the process associated with a utility ID, execute the `IOP:STATUS;PROCESS,ALL` input command after the recovery of the craft interface. If some processes were not restarted after a craft initialization, refer to Table 4-7 in the *UNIX® RTR Operating System Software Troubleshooting Guide* for the utility IDs to specific processes.

TYPE ..... Output

## 1. FORMAT

REPT SIMCHK a [b]

## 2. REASON FOR OUTPUT

To report error conditions that occurred while executing the System Integrity Monitor (SIM).

## 3. VARIABLE FIELD DEFINITIONS

- a System integrity error code. Code numbers labeled with an "\*" indicate conditions that may result in a system initialization phase unless software checks are inhibited.
- \*1 System initialization failure.
  - 2 System initialization status message received with unknown process number.
  - \*12 Unexpected fault received by SIM.
  - 101 Audit control subsystem initialization failure.
  - 102 Audit record initialization error.
  - 103 The System Integrity Output Formatter (SIOF) program is not running. Some output messages were lost.
  - 104 Routine audit scheduling was not allowed.
  - 121 Failure to get an audit record from the Equipment Configuration Database (ECD) using its Record ID (RID).
  - 122 Failure to update an audit record in the ECD.
  - 123 Failure to open a keyed sequence of audit records in the ECD.
  - 124 Failure to get a record in a sequence of audit records.
  - 125 Failure to get an audit record using the audit name and member number.
  - 126 Failure to read the SIM control record.
  - 127 Failure to update the SIM control record.
  - 128 Failure to open a sequence of audit instance records in the ECD.
  - 129 Failure to get a record in a sequence of audit instance records.
  - 130 Failure to get an audit instance record using its RID.
  - 131 Failure to update an audit instance record in the ECD.
  - 132 Failure to get an audit instance record using its instance name and the RID of the associated audit record.
  - 141 Audit marked active in its ECD record when it is not running.
  - 142 Invalid message received from the process manager or the utility manager regarding an audit process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 143 Audit reply received from an inactive audit.
- 144 Timeout occurred for an inactive audit.
- 145 Invalid reply received from an active audit.
- 146 System Integrity Output Formatter (SIOF) output buffer overflow; some audit output messages were lost.
- 147 Failure to find one and only one audit process for the specified utility ID.
- 148 Audit error report received from an inactive audit.
- 149 Invalid request to inform an audit process when the audit's ECD record is modified.
- 150 Invalid request to run or stop an audit.
- 151 Audit blocking condition cleared because it was invalid.
- 152 Failure to create a transient audit process.
- 153 Unable to take recovery action for an audit failure.
- 154 Audit inhibited by SIM because it could not be run, timed out, died or was faulted while correcting errors.
- 155 Routine audit scheduling malfunctioned and is being reinitialized. All routine audits are temporarily inhibited.
- 156 Failure to reinitialize routine audit scheduling after it had malfunctioned.
- 157 Routine audit scheduling has been temporarily inhibited because SIOF is not running.
- 158 Failure to reinitialize routine audit scheduling after SIOF stopped running.
- 159 Unknown error category in an error report from an audit process.
- 161 Audit system reinitializing due to error found in kernel level audit scheduling.
- 162 Audit system reinitializing due to error found for a kernel level audit timeout.
- 163 Audit system reinitializing due to error found for a routine supv-level audit timeout.
- 164 Audit system reinitializing due to error found for a requested supv-level audit timeout.
- 165 Audit system reinitializing because SIM received a reply from an inactive audit.
- 166 Audit system reinitializing because SIM received a timeout for a non-running audit.
- 167 Audit system reinitializing because SIM received a raw data report from an inactive audit.
- 168 Audit system reinitializing because SIM received an unexpected fault.
- 169 Audit system reinitializing because SIM found eligible audits not dispatched.
- 181 Failure to access an audit record in the plant measurements database.
- 182 Failure to create an audit record in the plant measurements database.
- 183 Failure to open the plan measurements database.
- 190 Audit has taken too much time to execute.

SEE PROPRIETARY NOTICE ON COVER PAGE

- \*200 Failure of the Application Integrity Monitor (AIM) process to reset the application sanity timer within the timeout interval.
- 201 Failure to activate or de-activate the application sanity timer.
- 202 AIM was not connected to port PT\_AIM when a PHASE 0 was requested.
- 203 Failure to change craft initialization inhibit status.
- 206 AIM not connected to port PT\_AIM for reception of overload faults.
- 207 AIM not connected to port PT\_AIM for soft-switch request.
- 208 AIM not connected to port PT\_AIM for notification of CU switch completion.
- 209 Faulty AIM port during craft initialization.
- 210 Faulty IOP port during craft initialization.
- 211 AIM not connected to port PT\_AIM for notification of completion of diverge request.
- 212 AIM not connected to port PT\_AIM for converge request.
- 213 AIM not connected to port PT\_AIM for notification of completion of converge request.
- 300 Unrecognized acknowledgement message received by SIM.
- 301 Unrecognized USRACK message received by SIM.
- 306 Message with invalid type received by SIM.
- 307 Unrecognized MSFAULT message received by SIM.
- 310 Unrecognized Operating System Trap (OST) entry received by SIM.
- 401 Failure to respond to a request from another process for information about the most recent system initialization.
- 602 Overload status change.
- 605 Kernel-level overload monitor process failed to initialize.
- 606 Supervisor-level overload monitor process failed to initialize.

b Up to three words of optional hexadecimal data, associated with specific error conditions.

\*1 Boot progress indicators, from left to right in hexadecimal:

- 0 — File manager.
- 1 — Disk driver.
- 2 — Process manager.
- 3 — Error interrupt handler.
- 4 — Capability manager.
- 5 — Scheduler.
- 6 — Utility manager.
- 7 — Memory manager.

If a boot process indicator message is received from a kernel process, the appropriate hexadecimal digit is set to 1; otherwise, the hexadecimal digit remains at 0.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 2 Process number of process sending the message (ms\_from).
- \*12 Fault code, followed by the virtual address within SIM at which the fault occurred.
- 102 ECD RID of the audit record that was not initialized.
- 121 RID used in attempt to get an audit record from the ECD.
- 122 RID used in attempt to update an audit record in the ECD.
- 126 RID of the SIM control record (as specified in the ECDORG record).
- 127 RID of the SIM control record (as specified in the ECDORG record).
- 128 If not zero, the RID of the audit record for which a sequence of instance records could not be opened.
- 130 RID used in attempt to get an audit instance record from the ECD.
- 131 RID used in attempt to update an audit instance record in the ECD.
- 132 RID of the audit record for which an associated instance record could not be gotten from the ECD.
- 141 RID of the audit record in error.
- 142 RID returned in the message (ms\_ident).
- 143 RID of the audit record, as specified in the reply.
- 144 RID of the audit record, as specified in the timeout identification.
- 145 RID of the audit record, as specified in the reply.
- 147 Utility ID (pcode) of the process, as specified in the audit record.
- 148 RID of the audit record, as specified in the error report.
- 149 RID of the audit record, as specified in the request, followed by the process number from which the request was received.
- 150 RID of the audit record, as specified in the request.
- 151 RID of the audit instance record process number of the blocking process, and the elapsed time in milliseconds since the audit instance was blocked.
- 152 RID of the audit record for which the audit process was not created.
- 153 RID of the recovery audit that could not be run.
- 154 RID of the audit that was inhibited.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 159 RID of the audit whose error was reported.
- 300 Message identity (ms\_ident).
- 306 Message type (ms\_type).
- 307 The fault code specified in the message.
- 310 The invalid Operating System Trap (OST) number, followed by the process number of the calling process.
- 602 Overload fault code:
  - A9 — Kernel process memory overflow. Swappable main memory is at minimum size.
  - AC — Message buffer overload cleared.
  - AD — Message buffer 70% full.
  - AE — Message buffer 90% full.
  - 81 — Spooler output process overload cleared.
  - 82 — Spooler output process overload.
  - 85 — Data link input buffer overload cleared.
  - 86 — Data link input buffer overload.
  - 87 — Data link output buffer overload
  - 88 — Data link output buffer
  - 8B — IOP overload cleared.
  - 8C — IOP command queue overloaded.
  - 8D — An IOP was bootstrapped due to overload.
  - 8F — Overload cleared on one Disk File Controller (DFC).
  - 90 — A DFC is overloaded.
  - 91 — File manager overload cleared.
  - 92 — File manager overloaded.
  - 95 — Supervisor/user level lockout cleared.
  - 96 — Supervisor/user level process lockout.
  - 97 — Timed entry overload cleared.
  - 98 — Kernel process timed entries slow.
  - 99 — Kernel level lockout cleared.
  - 9A — Kernel level process lockout.
  - 9C — Module 1 memory allocation reduced to 60%.
  - 9D — Module 1 memory at 80% allocated (only for generics with EMM feature).

SEE PROPRIETARY NOTICE ON COVER PAGE

- 9E — Insufficient memory available to grant a memory allocation (module 1) (only for generics with EMM feature).
- 9F — DCT table overload cleared.
- A0 — DCT table is 85% full.
- A1 — Dispatcher control table overflow.
- A2 — SDE table overload cleared.
- A3 — SDE table nearly full.
- A4 — Segment descriptor table overflow.
- A5 — Disk swap space overload cleared.
- A6 — Disk swap space 80% full.
- A7 — Memory overload cleared.
- A8 — Kernel process memory has grown to within 1/4 megabyte of its maximum size. This has reduced the size of swappable memory to within 1/4 megabyte of its minimum size.
- A9 — Kernel process memory overflow. Swappable main memory is at minimum size.
- AC — Message buffer overload cleared.
- AD — Message buffer 70% full.
- AE — Message buffer 90% full.

#### 4. ACTION TO BE TAKEN

For audit system initialization failures (error codes 101, 103, 104, 126, 127, 156, 158 and 183), seek technical assistance.

If the data printed with the output message includes an audit or instance RID, the audit name, member number and instance name associated with the RID may be found by using the OP:AUD input message with the ALL option. If the specified RID is not listed in the OP-AUD output message, the RID is invalid. If the error message is associated with a valid record, then an AUD output message may have been printed for the audit. If the audit aborted, the abort code printed in the output message will help in analyzing the failure.

For error code 141, use the STOP:AUD input message to clear the audit record.

For error code 146, use the OP:ST-PROCESS input message to determine whether or not the SIOF program is running. The file name of SIOF is /etc/siof. If it is running, no further action is required. If it is not running, seek technical assistance to determine the cause of the problem and what additional action needs to be taken.

SEE PROPRIETARY NOTICE ON COVER PAGE

For failures that involve an audit process (error codes 147, 152, and 154), verify that a valid process file exists for that audit. For transient audits, the process file should be stored in directory /audprc and its file name should be listed in the audit's ECD record. Use the RCV:MENU;RCV3B input message to read the record. For quasi-killable audits, the process may be identified from its utility ID number (which is listed in the audit's ECD record), using Practice 254-301-815.

For error code 154, use the STOP:EXC-ANY input command to terminate the audit process (if it is still running and is quasi-killable or transient). Then attempt to run the audit manually by using the AUD input command. If the problem does not recur, then use ALW:AUD to allow the audit.

For error code 159, use OP:AUD to identify the audit causing the problem. This error is due to a missing auderr form.

For error code 190, use OP:AUD to identify the audit causing the problem. There are two reasons for the audit taking too much time to execute: the audit may be incorrectly reporting actual time instead of CPU time or the audit may need to be broken down into several audits. Unless corrected, supervisor audit scheduling could be adversely affected resulting in the irregular scheduling of lower frequency level supervisor audits. A maximum of nine of these output messages will be printed in one 24-hour period of time.

A history of audit activity may be found in the most recent plant measurements report (REPT-OP, PMCR output message).

Additional information about the audit control subsystem may be found in the *System Maintenance Manual*.

If an overload monitor process failed to initialize (error codes 605 and 606), it may be executed manually with the EXC:ENVIR;PROC input command. The file names of these processes are /prc/klmon (kernel-level monitor) and /prc/supvprc (supervisor-level monitor).

|   | 19 — Received negative or invalid acknowledgement.                                                                     |
|   | 20 — Could not queue SCSI write.                                                                                       |
|   | 21 — Tried to send SCSI message with invalid type.                                                                     |
|   | 22 — Tried to send IMS message with invalid type.                                                                      |
|   | 23 — Invalid SCSI link state.                                                                                          |
|   | 24 — Call Detail Recording Platform (CDRP) polling timer timeout.                                                      |
|   | 25 — Sent a SCSI message with an invalid type.                                                                         |
|   | 26 — Could not write SCSI message.                                                                                     |
|   | 27 — Job is already in job queue.                                                                                      |
|   | 28 — Could not queue DMA job.                                                                                          |
|   | 29 — Invalid message block number.                                                                                     |
|   | 30 — Invalid message address.                                                                                          |
| d | Number of errors detected by SIN since the SIN was last restored.                                                      |
| e | SIN source file name where the error was detected.                                                                     |
| f | SIN source file line number where the error was detected.                                                              |
| g | Number of words of additional data printed.                                                                            |
| h | Additional data that can be used to debug the problem.                                                                 |
|   | For error codes X'01, X'07, and X'27, this is the SIN's 3B DMA job queue.                                              |
|   | For error code X'02, this is the SIN/3B status table.                                                                  |
|   | For error code X'03, the first 16 bits are the SIN's transition state and the next 16 bits are the current link state. |
|   | For error code X'04, this is the SIN's transition state.                                                               |
|   | For error code X'05, the first 16 bits are the previous link state and the next 16 bits are the new link state.        |
|   | For error codes X'06 and X'24, this is the SIN's message block states.                                                 |

SEE PROPRIETARY NOTICE ON COVER PAGE

For error codes X'08, X'09, X'11, X'12, X'13, X'14, X'17, X'20, and X'28, this is the return code from a SIN system function call.

For error codes X'10, X'15, X'19, and X'25, this is the IMS or SCSI message sent or received.

For error codes X'16 and X'26, this is the I/O control structure.

For error codes X'18 and X'23, this is the current link state.

For error codes X'21 and X'22, this is the invalid IMS or SCSI message type.

For error code X'29, this is the invalid message block number.

For error code X'30, this is the invalid message address.

#### **4. ACTION TO BE TAKEN**

For error code X'24, the CDRP is not polling the SIN. In this case, maintenance actions should be performed on the CDRP.

The other error codes indicate software problems with the SIN node; if they occur repeatedly, seek technical assistance.

- [17] REPT SIOF ERROR - CANNOT WRITE FILE a

## 2. REASON FOR OUTPUT

Format 1 indicates System Integrity Output Formatter (SIOF) cannot open input file.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 2 indicates SIOF cannot open output file.

Format 3 indicates size of supplementary data block passed to SIOF is not an integral multiple of the structure to be formatted.

Format 4 indicates SIOF cannot add the segment containing the supplementary data to its address space.

Format 5 indicates SIOF cannot set the access permission modes on the segment virtual address.

Format 6 indicates SIOF cannot add segment ID to the process segment list.

Format 7 indicates the segment identity stamp does not match the audit supplementary data segment identity stamp.

Format 8 indicates SIOF cannot free the supplementary data segment.

Format 9 indicates SIOF cannot get a segment index in the segment list.

Format 10 indicates that SIOF does not recognize the supplementary data type.

Format 11 indicates that SIOF does not recognize the format type of the output message.

Format 12 indicates that the maximum number of the message which can be passed at one time from System Integrity Monitor (SIM) to SIOF has been exceeded.

Format 13 indicates that an invalid alarm level has been specified for the audit report, and hence a space will be substituted.

Format 14 indicates that the supplementary data segment sent to SIOF is invalid.

Format 15 indicates that SIOF does not recognize the supplementary data format type.

Format 16 indicates that SIOF is unable to read the Output Message Database (OMDB) key from file.

Format 17 indicates that SIOF is unable to write first line of audit error report.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:SLM-DUMP-MSG  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

This message has three formats.

- [1] REPT SLM DUMP MSG  
a  
b
- [2] REPT SLM DUMP MSG  
a (continued)  
b
- [3] REPT SLM DUMP MSG  
THE MESSAGE:  
"b"  
OCCURRED c TIMES IN THE PAST d MINUTES

## 2. REASON FOR OUTPUT

To report that an unexpected message has been received.

Format 1 is used for short messages. It will accommodate messages up to 14 words (4 octets per word, 7 words per line). If a message is longer than 14 words, it will be continued with another message of Format 2.

Format 2 prints continuations of messages printed as Format 1. It will also accommodate continuations of up to 14 words and will be repeated as many times as necessary to dump the complete message.

Format 3 is used to limit the number of messages being printed on the ROP, a limit has been placed on the total number of messages that will be printed within a particular time period. This limit has been set to 5 messages per 5-minute period. If the total number of requests for a particular description of an error exceeds this limit, the message will not be printed and a message of Format 3 will be printed at the end of the period.

## 3. VARIABLE FIELD DEFINITIONS

- a Description of error.
- b The message dumped in hexadecimal.
- c The number of times the message should have been printed during the last time period.
- d The time period over which the message should have been printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

The contents of this output message are not intended to be analyzed by the on-site work force. Rather it is an indication that the SLMK process has received a message which it cannot decipher or an extremely rare or unexpected event has occurred. The contents of this message can greatly enhance the analysis of certain service-affecting events and as such, the message may be of great benefit to field support organizations.

Infrequent occurrences of this message may most likely be ignored, however, as the frequency of occurrence increases, site personnel should be particularly cognizant of abnormal operation as reported by other sources of information. The message is throttled such that the ROP will not be over-burdened by such messages.

Here is an example of what might cause this message. From time to time the CCS7 protocol may be changed to support new features. This is normally done in such a way that changes need not be implemented in a simultaneous fashion in all network sites. As sites are updated, they may begin to emit new messages which are unrecognizable by network sites that are yet to be updated. In such cases the site printing the REPT SLM DUMP MSG is displaying the fact that it cannot recognize the message and is discarding it. This is a normally accepted reaction. In cases where the frequency of occurrence increases, it may be an indication that an unexpected and troublesome situation is occurring. There should always be other indications of trouble in these cases and this message may help resolve such problems but higher level support is likely required.

#### **5. REFERENCES**

ID ..... REPT:SLM-NDERR  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

- [1] REPT SLM NDERR  
      NODE a-b ACTION = c FUNCAREA = d OTHERDATA = e
- [2] REPT SLM NDERR  
  
      f CLNODERR() ACTIONS NOT PRINTED

## 2. REASON FOR OUTPUT

Format 1 reports events that indicate trouble in the link node. Signaling Link Management (SLM) uses this message for some of these events; SLM will remove the node from service.

Format 2 is used when the number of Format 1 reports becomes excessive. The number of dropped messages is given in this report.

## 3. VARIABLE FIELD DEFINITIONS

- a Node's group number (0 - 63).
- b Node's member number (1 - 15).
- c The action taken by the system on the node:
- NDRMVD — No system action, node currently removed.
  - NOACT — No system action initiated, error report only.
  - RAD — Remove and diagnose the node.
  - RAPD — Remove and partial diagnose the node.
  - RAR — Remove and restore the node.
  - RST — Restart the node.
- d The subsystem reporting the node trouble:
- APPL — The CNI user software.
  - SCCP — Signaling connection control part.
  - MH — Message handling.
  - DBASE — Database.
  - NM — Network management.
  - TOOLS — Tools.
  - SYS — System control/interface.
  - LNC — Link and node control.
  - MTCE — Maintenance.
  - MEAS — Measurements.
  - LI — Link interface.
  - LISNTY — Link interface sanity.

SEE PROPRIETARY NOTICE ON COVER PAGE

e Other data, this code is unique to each subsystem reporting the error and identifies the error.

APPL: — None.

SCCP: — 1 — DCHN TSC (D-Channel temporary signaling connection) Input/Response array buffer resource unavailable.  
2 — DCHN TSC Release of array buffer resource failure.  
3 — DCHN TSC Control structure for ring write unavailable.  
4 — DCHN TSC Signal connection control point oriented control (SCOC) database (DB) segment count audit error.  
5 — DCHN TSC SCOC DB equipment count audit error.  
6 — DCHN TSC Local reference number (LRN) audit error.  
7 — DCHN TSC Network connection identifier (NCID) audit error.

MH: — 600 — CCS6 Invalid real-time executive (RTX) device message received.  
601 — CCS6 Invalid RTX message type received.  
602 — CCS6 Ring write failure.  
603 — CCS6 LI receive mailbox read failure.  
604 — CCS6 Cannot open channels to the LI.  
605 — CCS6 Cannot set controls for LI channels.  
606 — CCS6 Data retrieval failure.

DBASE: — None.

NM: — 20 — CCS7 Link congestion failed to abate.

TOOLS: — None.

SYS: — None.

LNC: — 20 — CCS7 Continuous link congestion.  
21 — CCS7 LKBDST audit error.  
22 — CCS7 bad node load data.  
23 — CCS7 declared link failure.  
24 — CCS7 node changing from unavailable (UNA) to available (AVL) state.  
25 — CCS7 IMS conditional node removal request.  
26 — CCS7 REMACS failed single node pump.  
27 — CCS7 REMACS failed all node pump request.  
28 — CCS7 node initialization problem, likely an equipment configuration database (ECD) problem, check field 62, the Pack Code, of the unit control block (UCB) for this node.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 40 — CCS6 continuous congestion/ far-end processor signaling congestion (PSC) or link node (ln) sanity error.
- 41 — CCS6 bad node load data.
- 42 — CCS6 declared link failure.
- 43 — CCS6 node changing from UNA to AVL state.
- 44 — CCS6 IMS conditional node removal request.
- 45 — CCS6 REMACS failed single node pump.
- 46 — CCS6 REMACS failed all node pump request.
- 47 — CCS6 node initialization problem, likely an ECD problem, check field 62, the Pack Code, of the UCB for this node.
  
- 60 — PBX Node data error found by LKBDST audit.
- 61 — PBX Links failed to achieve a valid state.
- 62 — PBX LI insanity indication.
- 63 — PBX Missing acknowledgement from node, link state unknown.
- 64 — PBX REMACS init. OOS.
- 65 — PBX REMACS init. unknown.
- 66 — PBX REMACS failed single node pump.
- 67 — PBX REMACS failed all node pump request.
- 68 — PBX Nodetype of data pumped to the node did not match the type of node receiving the data, i.e. the nodetype of the node.
- 69 — PBX node initialization problem, likely an ECD problem, check field 62, the Pack Code, of the UCB for this node.
- 70 — PBX After the node initialized and indicated to the 3B that it was ready for a data pump, the 3B's attempt to pump data to the node failed.
- 71 — PBX Node failed to initialize and execute to the point where it was ready for a data pump. After timeout, when the 3B attempted to pump data to the node, the data pump failed.
  
- 80 — DLN Complaint on a direct link node (DLN) that is active and 1 way out.
- 81 — DLN Not in the active state.
- 82 — DLN Complaint on a DLN that is the active home DLN.
- 83 — DLN REMACS failed single node pump.
- 84 — DLN REMACS failed all nodes pump request.
  
- MTCE: — 1 — Failure to open link interface (LI) Maintenance channel.
- 2 — Failure to set controls on LI Maintenance channel.
- 3 — MTCE process received an invalid RTX message.

SEE PROPRIETARY NOTICE ON COVER PAGE

4 — MTCE process has failed.

MEAS: — None.

LI: — 1 — Operating system in the LI failed to start.  
2 — Node processor-link interface (NP-LI) failed periodic exercise.  
3 — NP has received a FATAL message from the LI.  
4 — NP has read an undefined transaction from the LI.  
5 — NP could not write exercise acknowledge message to LI.  
6 — LI has requested an undefined exercise to be run.  
7 — Mismatch of Lndata encryption type and actual LI type.  
8 — NP received invalid RTX message.  
9 — Maintenance flag contained invalid value.  
10 — Unknown link interface DS0-A (LID0) boot monitor status.  
11 — Link node data LI type does not agree with the actual node LI type.  
12 — Local loop-back test failure.  
13 — Digital signal zero A (DS0-A) composite clock failure.  
14 — Invalid init parameter passed from NP to LI.  
15 — Invalid command parameter passed from NP to LI.  
16 — LI reports critical receive buffer congestion.  
17 — LI reports excessive receive buffer congestion.  
18 — NP had to force a hard reset to link interface DS0-A (LID0) when initializing the node. Reported for information use only.  
19 — LID0 flash memory contents are out of date. Diagnostic phase 51 must be run to update it.

LISNTY: — 0 — LI sanity timer has timed out.  
-107 — LI unassigned interrupt occurred.  
-200 — LI has been declared dead.  
-201 — Interrupt request has not been enabled.  
-202 — Illegal address has been specified.  
-203 — Illegal data transfer has been requested.  
-204 — Illegal maintenance command has been given.  
-205 — Illegal address range has been specified.  
-206 — Illegal diagnostic phase has been requested.  
-207 — Illegal exercise has been requested.  
-208 — A fatal parity failure has occurred.  
-209 — Illegal maintenance transaction has occurred.  
-210 — Maintenance mail box failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 211 — LI exercise failure.
- 212 — LI parity detection check failure.
- 213 — LI sum check failure.
- 214 — LI-NP interface monitor has timed out.
- 215 — LI 8086 test failure.
- 251 — LID0 SCC DMA parity error.
- 253 — LID0 SHARED RAM parity error.
- 255 — LID0 LOCAL RAM parity error.
- 301 — Flash memory checksum failure.
- 302 — Read only memory (ROM) checksum failure
- 303 — Central processing unit (CPU) test failure.
- 304 — Address test failure.
- 305 — Local random access memory (RAM) test failure.
- 306 — Local RAM parity generator failure, low byte.
- 307 — Local RAM parity generator failure, high byte.
- 308 — Local RAM stuck-at test failure, low byte.
- 309 — Local RAM stuck-at test failure, high byte.
- 310 — Local RAM false parity test failure, low byte.
- 311 — Local RAM false parity test failure, high byte.
- 312 — Shared RAM test failure.
- 313 — Shared RAM parity generator failure, low byte.
- 314 — Shared RAM parity generator failure, high byte.
- 315 — Shared RAM stuck-at test failure, low byte.
- 316 — Shared RAM stuck-at test failure, high byte.
- 317 — Shared RAM false parity test failure, low byte.
- 318 — Shared RAM false parity test failure, high byte.

**NOTE:** Fail codes in the range of -300 through -399 are reserved for and associated only with LID0 boot monitor sanity test failures.

f                      # of missed messages printed to the receive only printer (ROP) in past 5 min.

#### 4. ACTION TO BE TAKEN

Dependent upon the description of the error. As a general step, the LKBDST audit can be requested to verify the condition of the node and links. See AUD:LKBDST. If the audit indicates errors, retry the audit. If the errors do not clear, RMV and diagnose the node.

SEE PROPRIETARY NOTICE ON COVER PAGE

Some errors may be cleared by using the CHG:SLK input command to change the minor state of the link. For example, an out-of-service (OOS) link can be changed first to manual out-of-service (MOOS), and then back to in-service (IS) or OOS (see CHG:SLK).

Further error messages indicate that the node should be removed and diagnosed. The LKC:SLK input command with the Internal option may also be used to test the node and link condition.

- [3] REPT SLMK CES  
d CRITICAL EVENTS DROPPED IN THE LAST HOUR
- [4] REPT SLMK PSLT  
PERIODIC SLT INHIBIT ON, FIRST  
NODE e-f

## 2. REASON FOR OUTPUT

Format 1 is a progress report for initialization and abort sequences of SLMK in the CNI subsystem.

Format 2 reports the status of the automatic link removal inhibit. This inhibit is separate and distinct from the manual inhibit for link removals. See INH:RMV input message.

Format 3 reports the number of critical events messages missed within the last hour due to incomplete processing within the SLMK process. The incomplete processing can be caused by two situations. One is initializations, SLMK does not fully process critical events during initializations. Thus, one of these reports can be expected one hour after SLMK reaches its steady operating state, currently state 14. Secondly, when critical event throttling is selected, this report indicates the number of critical events not processed when the throttle threshold is exceeded for the last hour. When all critical events are fully processed by the SLMK process, i.e., a count of zero, no report is generated.

Format 4 reports reports Periodic Signaling Link Test (PSLT) is inhibited for some links in the office. The report gives the group and member numbers of the first link found in the data base with the PSLT inhibited. A complete list of the links inhibited can be obtained by using the INH:PSLT command.

## 3. VARIABLE FIELD DEFINITIONS

GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

REPT SLMSHR  
CNI GENERIC RELEASE a

## 2. REASON FOR OUTPUT

The REPT:SLMSHR message originates from the SLMSHR process. This message is output to provide status information; it identifies the current CNI generic point release.

**NOTE:** Information output by SLMSHR may not be useful to the user. This information is intended for use by development/support personnel when diagnosing CNI errors or faults.

## 3. VARIABLE FIELD DEFINITIONS

a Present CNI Generic Release.

## 4. ACTION TO BE TAKEN

None.

## 5. REFERENCES

Practice 234-151-120 *Trouble Clearing and Maintenance Procedures* - Link Operating  
Procedures Section

## 1. FORMAT

- [1] REPT SLT  
SLK a b RECEIVED SLTM IN ERROR  
RCV\_DPC: c RCV\_OPC: d RCV\_SLC: e  
EXP\_DPC: f EXP\_OPC: g EXP\_SLC: h
  
- [2] REPT SLT  
SLK a b RECEIVED SLTA IN ERROR  
RCV\_DPC: c RCV\_OPC: d RCV\_SLC: e RCV\_LI: i  
EXP\_DPC: f EXP\_OPC: g EXP\_SLC: h EXP\_LI: j
  
- [3] REPT SLT  
SLK a b EXPECTED TEST PATTERN IN SLTA WAS NOT RECEIVED
  
- [4] REPT SLT  
SLK a b RECEIVED SLTM DISCARDED, NOT IN AVAILABLE STATE
  
- [5] REPT SLT  
SLK a b SLTA WARNING: 'SLTCHK OFF' AND LINK APPEARS SELF LOOPED
  
- [6] REPT SLT  
SLK a b SLTA WARNING: 'SLTCHK OFF' YET LINK IS NOT SELF LOOPED"

## 2. REASON FOR OUTPUT

An SLT fails or a self-loop is detected by an SLT.

When a Signaling Link Test (SLT) fails or a self-loop is detected by an SLT, one of the following formats will be output. The report can be generated for both CCS7 and CCITT7 links. Because a persistent SLT failure can result in large amounts of output, the reports are limited to five (5) in any given fifteen (15) minute interval. In that interval the first five reported will be output.

## 3. VARIABLE FIELD DEFINITIONS

- a Group Number (0-63).
- b Member Number (1-15).
- c Destination Point Code (DPC) in the received SLTM or SLTA.
- d Origination Point Code (OPC) in the received SLTM or SLTA.
- e Signaling Link Code (SLC) in the received SLTM or SLTA.

SEE PROPRIETARY NOTICE ON COVER PAGE

|   |                                             |
|---|---------------------------------------------|
| f | Expected DPC for the received SLTM or SLTA. |
| g | Expected OPC for the received SLTM or SLTA. |
| h | Expected SLC for the received SLTM or SLTA. |
| i | Length Indicator (LI) in the received SLTA. |
| j | Expected LI for the received SLTA.          |

#### 4. ACTION TO BE TAKEN

Format 1: In cases where the following three conditions are all satisfied: the RCV\_DPC field contains the same value as the EXP\_OPC, the EXP\_DPC field contains the same value as the RCV\_OPC and the RCV\_SLC and the EXP\_SLC fields contain the same value; it is likely that a self-loop exists somewhere in the facility.

If there is no loop found in the facility, or the data in the OPC, DCP and SLC fields is not as described, refer this problem to the office data administration personnel. This problem can either be in the data at the local office, or it can be a data problem at the far end.

Format 2: Same action taken for Format 1. In addition, if the problem is in the Length Indicator, (LI), seek technical assistance. The LI is software generated.

Format 3: Seek technical assistance, the test pattern is software generated. Either the local end is interpreting the received test pattern incorrectly, or the far end is sending an incorrect test pattern.

Format 4: If the intent for this link is to be carrying traffic, recent change the major state to Available (AVL), else ignore this report.

Format 5: This warning message indicates that SLTM/SLTA exchange is successfully done under the self-loop condition. The self-loop intention is indicated by sltchk off command, and the link is self-looped. If self-looping is desired, ignore this report. If self-looping is not desired, execute the sltchk on command, and clear the self-loop on the facility.

Format 6: This warning message indicates that SLTM/SLTA exchange is successfully done under the end-to-end condition. Although a self-loop intention is indicated by sltchk off, the link is NOT self-looped. If self-looping is not desired, execute sltchk on. If self-looping is desired, establish a loop on the link.

## 2. REASON FOR OUTPUT

The format of the output message is dependent upon the report type assigned to the report name. There are ten report generator functions available as shown in the following tables.

These output messages are produced by the automatic measurement reports which are output periodically according to the Schedule (SCHD) table . The OP:SCHD command displays the contents of the Schedule Table.

Message Formats 2a and 3a are output when a report generator process receives a termination signal from CMMSDP, its parent process. CMMSDP will send this termination before it aborts, if the report generator is reading a file CMMSDP needs to update, or if the number of current report generators running exceeds 20.

SEE PROPRIETARY NOTICE ON COVER PAGE

| REPORT<br>GENERATOR<br>TYPE | REPORT<br>NAME | MEANING                                               |
|-----------------------------|----------------|-------------------------------------------------------|
| Fixed Format Reports        |                |                                                       |
| AM30MPR                     | A30MPR30       | Signaling link 30 minute marginal performance report. |
| AMMPR                       | AMPR[#]        | Machine performance report.                           |
| AMSEPR                      | ASEPR[#]       | Signaling equipment performance report.               |
| AMSNPR1                     | ASNPR1[#]      | Signaling network performance report - Part 1.        |
| AMSNPR2                     | ASNPR2[#]      | Signaling network performance report - Part 2.        |
| CMRINGEX                    | RINGEXLPM      | RPC overflow report.                                  |

| REPORT<br>GENERATOR<br>TYPE | REPORT<br>NAME | MEANING                          |
|-----------------------------|----------------|----------------------------------|
| Flexible Format Reports     |                |                                  |
| CMNFDISK                    | NFDISK         | Non-fixed disk report.           |
| CMNFDISKEX                  | NFDISKEX       | Non-fixed disk exception report. |

### 3. VARIABLE FIELD DEFINITIONS

These reports are paginated. The page and report period variables are the same for all formats and are:

- \* Page number of report.
- \*\* Total number of pages in the report.
- # Report period:
  - 15 — 15 minutes
  - 30 — 30 minutes
  - HR — 1 hour
  - CDAY — Current day
  - LDAY — Last (previous) day

Format 1 variables.

- a Reporting office CLLI® code.
- b The accumulation period: DAILY, HOURLY, HALF HOURLY, FIFTEEN MINUTES

| n | Group number of link in frame: 00-63.                                                                                                                                                                                                                                                                                                                                                                              |
| o | Member number of link in frame: 01-15.                                                                                                                                                                                                                                                                                                                                                                             |
| q | Out-of-service time in minutes and seconds.                                                                                                                                                                                                                                                                                                                                                                        |

**NOTE:** Any of the following measurements may appear on the report followed by an asterisk (\*) indicating that the threshold for that measurement has been exceeded. Only links that have at least one measurement whose threshold is exceeded are printed; therefore, if no data should appear on this report, then no thresholds were exceeded for the report period.

|   |                                                    |
|---|----------------------------------------------------|
| u | The number of automatically initiated changeovers. |
| w | Cyclic Redundancy Check (CRC) errors.              |
| x | Bytes retransmitted.                               |

**NOTE:** If link has Basic Error Correction (BEC), then x is bytes retransmitted. If link has Preventative Cyclic Redundancy (PCR) error correction, then x is forced bytes retransmitted.

Format 3 variables.

|   |                                                                             |
|---|-----------------------------------------------------------------------------|
| a | Reporting office CLLI® code.                                                |
| b | The accumulation period: DAILY, HOURLY, HALF HOURLY, FIFTEEN MINUTES        |
| c | The current generic.                                                        |
| d | Local time zone date. (Ex: month / day / year).                             |
| e | Local time zone time. (Ex: hour:minute:second).                             |
| f | Network date at beginning of accumulation period. (Ex: month / day / year). |
| g | Network time at beginning of accumulation period. (Ex: hour:minute:second). |
| h | Network date at end of accumulation period. (Ex: month / day / year).       |
| i | Network time at end of accumulation period. (Ex: hour:minute:second).       |

SEE PROPRIETARY NOTICE ON COVER PAGE

- j The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is aaa/ccc where aaa is the number of periods of accumulated data for this report and ccc is the maximum number of periods that can be covered where:
- $001 \leq aaa \leq 288$  (288 periods equals one day - 24 hours)
- $001 \leq ccc \leq 288$   
 $aaa \leq ccc$ .
- k Group number of link in frame: 00-63.
- l Member number of link in frame: 00-15.
- m Peg count of transient errors, errors which do not result in a node being removed from service.
- n Peg count of out-of-service time due to faults; this includes all time that a node is automatically removed from service.
- o Duration of time in seconds that a node is out-of-service due to faults.
- p Peg count for manually initiated out-of-service time.
- q Duration of time in seconds that a node is manually out-of-service.
- r Peg count for out-of-service time due to ring reconfiguration that isolates this node.
- s Duration of time in seconds that a node is out-of-service due to a ring reconfiguration.
- t User defined string (by way of the ECD). This is the time zone indicator and has a default of NWT within the Continental U.S.

Format 4 variables.

- a Reporting office CLLI® code.
- b The accumulation period: DAILY, HOURLY, HALF HOURLY, FIFTEEN MINUTES
- c The current generic.
- d Local time zone date. (Ex: month / day / year).
- e Local time zone time. (Ex: hour:minute:second).
- f Network date at beginning of accumulation period. (Ex: month / day / year).
- g Network time at beginning of accumulation period. (Ex: hour:minute:second).

- e Network date at beginning of accumulation period.  
(Ex: month / day / year).
- f Network time at beginning of accumulation period.  
(Ex: hour:minute:second).
- g Network date at end of accumulation period.  
(Ex: month / day / year).
- h Network time at end of accumulation period.  
(Ex: hour:minute:second).
- i The number of accumulation periods (one period is 5 minutes) out of the maximum number of coverage periods for this report; format is aaa/ccc where aaa is the number of periods of accumulated data for this report and ccc is the maximum number of periods that can be covered where:
- $001 \leq aaa \leq 288$  (288 periods equals one day - 24 hours)
- $001 \leq ccc \leq 288$   
 $aaa \leq ccc$ .
- l Group number of RPC in frame: 00-63.
- m Member number of RPC in frame: 00-15.
- n Overflow peg count for level 0 (zero); this is the abatement level and indicates how many times this normal operational level was reached from a higher overflow level.
- o Overflow peg count for Level 1.
- p Overflow time duration in seconds for Level 1 (time of o preceding).
- q Overflow peg count for Level 2.
- r Overflow time duration in seconds for Level 2 (time of q preceding).
- s Overflow peg count for Level 3.
- t Overflow time duration in seconds for Level 3 (time of s preceding).
- u User defined string (by way of the ECD). This is the time zone indicator and has a default of NWT within the Continental U.S.

Format 7 variables.

- a Report name from the Schedule (SCHD) Table.
- b Julian date: 1 - 366
- c Starting data collection period: 1 - 288
- d The number of office measurements from the User View Descriptor Table (UVDT).

| r | Number of cluster measurements in the UVDT.     |
| s | Cluster number.                                 |

#### 4. ACTION TO BE TAKEN

If either Format 2a or 3a appears, demand the report for the interval in question since the history file is complete and will produce a valid report. Use input message OP:SMR.

The remainder of the messages require no action.

WARNING: a NM/SCMG MSGS DROPPED IN LAST b MIN -- NL  
PA TBL  
OVRFL

[3] REPT SNM

WARNING: a SCMG MSGS DROPPED IN LAST b MIN -- NL  
SSNBITS TBL  
OVRFL

## 2. REASON FOR OUTPUT

REPT SNM messages originate in the SLMK process. These messages warn that MTP signaling network management (NM) or SCCP management (SCMG) messages have been discarded due to lack of space in the nonlocal network routing tables in the last time interval.

The three tables that are monitored are:

1. Nonlocal Network Member table (cNnl\_mem).
2. Nonlocal Network Page Access table (cNpage\_access).
3. SCCP Subsystem Bits table (cSsnbits).

Format 1 warns that NM/SCMG messages have been dropped due to lack of space in the Nonlocal Network Member table in the last b minutes.

Format 2 warns that NM/SCMG messages have been dropped due to lack of space in the Nonlocal Network Page Access table in the last b minutes.

Format 3 warns that SCMG messages have been dropped due to lack of space in the nonlocal network ssnbits table in the last b minutes.

SEE PROPRIETARY NOTICE ON COVER PAGE

### **3. VARIABLE FIELD DEFINITIONS**

- a                      Number of messages dropped.
- b                      Interval over which NM/SCMG messages were dropped (in minutes).

### **4. ACTION TO BE TAKEN**

Formats 1, 2, and 3:    Run the NM Audit. If there is an error in the tables which is causing the problem, the audit should be able to detect the error and to recover more space in the tables which will eliminate the problem. However, if the situation persists after the audit is run, the size of the tables is inadequate for the number of network events that are occurring at the present time. There is no further immediate action that can be taken. ROP and REPTLOG output should be collected and CNI customer support should be notified of the problem.

### **5. REFERENCES**

None.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] REPT SOP a OUTPUT MESSAGES DISCARDED FOR b
- [2] REPT SOP DELETING OLDER HALF OF c
- [3] REPT SOP INVALID OUTPUT REQUEST [OMDB KEY d]  
    Uid: e                      Logfile: c  
    Logflimit: f                Request size: g
- [4] REPT SOP CANNOT OPEN SCC CHANNEL

## 2. REASON FOR OUTPUT

To report a Spooler Output Process (SOP) related error or warning.

Format 1 indicates message loss because of spooler queue overflow for a particular device.

Format 2 indicates the log file became full and the older half of the log file has been deleted to allow for the storage of newly generated messages.

Format 3 indicates that an output report to be written to the named log file is larger than the maximum size of the log file.

Format 4 indicates a failure to open the output device that is associated with the Switching Control Center (SCC).

## 3. VARIABLE FIELD DEFINITIONS

- a                      Number of output messages discarded due to spooler queue overflow.
- b                      Name of device.
- c                      Name of log file.
- d                      Output Message Database (OMDB) key number of the output report.
- e                      Utility Identification (UID) of the process requesting the output report.
- f                      Maximum size of the log file.
- g                      Size of the requested output report.

## 4. ACTION TO BE TAKEN

For Format 1, if spooler queue overflow occurs repeatedly for the same device during normal operations, seek technical assistance. Otherwise, it may be necessary to increase

SEE PROPRIETARY NOTICE ON COVER PAGE

the queue size for that device. Use the Recent Change and Verify (RC/V) system to modify the maxq field of the device record for the device.

For Format 2, take no action.

For Format 3, use RC/V to increase the logflimit field in the device form for the named log file.

For Format 4, use RC/V to examine the Equipment Configuration Database (ECD) logdev record for the device and verify that the channel ID is specified correctly.

## **5. REFERENCES**

### **OMDB Keys**

- Format 2 has an OMDB key of 12.
- Format 3 has an OMDB key of 715.
- Format 4 has an OMDB key of 517.

SEE PROPRIETARY NOTICE ON COVER PAGE

Where the preceding variables are defined as:

npt — Numbering plan type.

npanxx — First six digits of the number.

llll — The low line number of the range.

hhhh — The high line number of the range.

xxxx — The last four digits of the customer ID.

#### 4. ACTION TO BE TAKEN

For errors:

```
[11] REPT SPGTT d CPerr() SEV 3
 error en; fn; line ln
 TRAN [tr];
```

```
[49] REPT SPGTT d SPerr() SEV 3; DIST dd; DELTA ttttttt; esc
 error en; fn; line ln
 TRAN [tr];
```

```
[53] REPT SPGTT d SPerr());CID MISMATCH DETECTED ANI npt npanxx llll-
 hhhh
```

With a value of [tr] being either DELANIRNG or ADDRECRD determine the npt and npanxx from [tr] or directly from the message for [53]. For all other values of [tr] seek technical assistance.

Perform a verify on that number using the input command VER:GTT with the following options:

- RNA as specified in d of the REPT:SPGTT message
- Translation type: 252
- Numbering plan type: npt from [tr].
- ABC: npa from [tr]
- DEF: nxx from [tr]
- GHIJ: llll from [tr]

Remove that npt/npanxx using the input command RC:GTT with the following options:

- Translation type: 252
- Database Operation: D
- Digit number: npanxx from [tr]. Only six digits are to be entered.
- Numbering plan type: npt from [tr].

SEE PROPRIETARY NOTICE ON COVER PAGE

For error:

```
[48] REPT SPGTT d SPerr() SEV 1
 error en; fn; line ln
 TRAN [tr];
```

notify the National Electronic Switching Assistance Center (NESAC) to inform the CDID workcenter of a table resource exhaust.

If repeated errors indicate problems, seek technical assistance.

## **5. REFERENCES**

None.

## 1. FORMAT

REPT SPL SYNTAX ERROR a b

## 2. REASON FOR OUTPUT

To report that an incorrectly formatted message was passed to the spoolf() function in the craft library.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code specifying the error condition detected:
- 0 — First \$ in user control string missing.
  - 1 — Teletypewriter (TTY) field too big (greater than eight characters).
  - 2 — TTY size is maximum and first byte is not '-' (minus), or the contents of the string is a minus sign only.
  - 3 — NULL TTY is specified with no spooler options.
  - 4 — Class not decimal.
  - 6 — Class field too big (greater than 255).
  - 7 — Missing both TTY field and class field.
  - 8 — Paction field was not 0 or two characters long.
  - 9 — Timestamp type field too big (greater than one character).
  - 10 — Timestamp type field invalid. The timestamp type must be f (full time stamp), b (basic time stamp), or n (no time stamp).
  - 11 — Priority field not decimal.
  - 12 — Priority field too big (greater than one character).
  - 13 — Priority value greater than seven (highest priority).
  - 14 — IDENT field too big (greater than four characters).
  - 15 — IDENT field not decimal.
  - 16 — Type field too big (greater than four characters).
  - 17 — Type field not decimal.
  - 19 — User file does not exist or cannot be read.
  - 20 — User Process Identification (PID) too big (greater than eight characters).
  - 21 — User PID not decimal.
  - 22 — Last \$ in user control string missing.
  - 23 — Invalid paction.
  - 24 — Process number does not correspond to existing process.
  - 25 — Send message to Coordinator Of Spooler Output Processes (CSOP) failed.
  - 26 — Message is truncated by sendpw.
  - 27 — User file does not have full pathname.

TYPE ..... Output

**1. FORMAT**

REPT SSTBLCREAT  
SUBSYSTEM TABLE INITIALIZATION COMPLETE

**2. REASON FOR OUTPUT**

This message indicates that new disk files for subsystem distribution table and local subsystem information table were created with default values. These disk files are read into the 3B computer Protected Application Segment (PAS) during initialization.

**3. VARIABLE FIELD DEFINITIONS**

None.

**4. ACTION TO BE TAKEN**

None.

**5. REFERENCES**

## 1. FORMAT

This message has two formats.

[1] REPT START EVENTSESS CANNOT SEND MESSAGE TO THE 3B

[2] REPT START EVENTSESS CANNOT SEND MESSAGE TO THE 1A

## 2. REASON FOR OUTPUT

Format 1. Event filter and print session start request cannot be sent to the 3B AMA formatter.

Format 2. Event filter and print session start request cannot be sent to the 1A.

## 3. VARIABLE FIELD DEFINITIONS

None.

## 4. ACTION TO BE TAKEN

None.

## 1. FORMAT

- [1] REPT START PING ERROR  
INVALID NODE VALUE ENTERED FOR EIN PARAMETER
- [2] REPT START PING ERROR  
MISSING NODE NUMBER FOR EIN PARAMETER
- [3] REPT START PING ERROR  
MISSING EIN PARAMETER
- [4] REPT START PING ERROR  
INVALID IP ADDRESS FORMAT
- [5] REPT START PING ERROR  
MISSING IP ADDRESS PARAMETER
- [6] REPT START PING ERROR  
MISSING IP PARAMETER
- [7] REPT START PING - CANNOT SEND MESSAGE TO THE AMA FORMATTER

## 2. REASON FOR OUTPUT

To report an error from processing the START:PING input command.

Format 1 is printed when Ethernet® Interface Node (EIN) node value is incorrect (0-1).

Format 2 is printed when the EIN node value is not specified on the input command line.

Format 3 is printed when the EIN keyword is missing.

Format 4 is printed when the Internet Protocol (IP) address is incorrect. The correct format is xxx.xxx.xxx.xxx where each xxx must be a numeric value between 0 and 255 and the IP address must be enclosed inside double quotes.

Format 5 is printed when the IP address is not specified on the input command line.

Format 6 is printed when the IP keyword is missing.

Format 7 is printed when the request cannot be sent to the Automatic Message Accounting (AMA) formatter process.

SEE PROPRIETARY NOTICE ON COVER PAGE

### **3. VARIABLE FIELD DEFINITIONS**

See Reason for Output.

### **4. ACTION TO BE TAKEN**

The user needs to re-enter the input with the corrected information. For format 7 the AMA formatter process may need to be restarted.

TYPE ..... Output

## 1. FORMAT

REPT SUA STATUS CHECK ERROR: RCODE=r ERRNO=e

## 2. REASON FOR OUTPUT

This message is output when SUautomgr process receives an error condition while trying to get the Software Update Automation feature status from the 1B.

## 3. VARIABLE FIELD DEFINITIONS

r Indicates the return code. See the following table for details.  
e Indicates the standard system error number returned.

| RCODE | Meaning                                                |
|-------|--------------------------------------------------------|
| -1    | Open 1Bfile for read failed                            |
| -2    | Unable to get TRAF3BDT address from 1B vector TRAF3BSS |
| -3    | Out of range TRAF3BDT pident address or ERRORSTOP      |
| -4    | Unable to position (lseek) to the TRAF3BDT pident      |
| -5    | TRAF3BDT pident MAGIC mismatch                         |
| -6    | Failure to read SETHDR                                 |
| -7    | Failure to find TRAF3BDT SET7                          |
| -8    | Failure to read SET7 body                              |
| -9    | Failure to read SET7 data                              |

## 4. ACTION TO BE TAKEN

If there are problems with 3B stability or 1Bfile access, resolving those conditions may solve this error condition automatically. Only the Automation capability of the SU will be blocked by this error. Seek Field Update assistance if needed.

TABLE 1  
Error Codes

| Error Code | Explanation of Error Code                                                                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| **         | This message was generated by a kernel process. The error code is not available.                                                                                                                                                                             |
| 01         | Typically this error indicates an attempt to modify a file in some way forbidden except to its owner or super-user. It is also returned for attempts by ordinary users to do things allowed only to the super-user.                                          |
| 02         | A file name is specified and the file should exist but does not, or one of the directories in a path name does not exist.                                                                                                                                    |
| 03         | The process corresponding to that specified by pid in a system call does not exist or is already dead.                                                                                                                                                       |
| 04         | An asynchronous signal (such as interrupt or quit), which the user has elected to catch, occurred during a system call. If execution is resumed after processing the signal, it will appear as if the interrupted system call returned this error condition. |
| 05         | A physical I/O error occurred during read or write.                                                                                                                                                                                                          |
| 06         | I/O on a special file refers to a subdevice which does not exist, or is beyond the limits of the device. It may also occur when, for example, a tape drive is not on-line or no disk pack is loaded on a drive.                                              |
| 07         | An argument list longer than 5120 bytes was used in a call trying to execute a process.                                                                                                                                                                      |
| 08         | A request was made to execute a file which, although it has the appropriate permissions, does not start with a valid magic number. This could be as a result of a faulty field update attempt. A roll back might clear the problem.                          |
| 09         | Either a file descriptor refers to no open file, or a read (or write) request is made to a file which is open only for writing (or reading).                                                                                                                 |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (cont'd)

| Error Code | Explanation of Error Code                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10         | A wait was executed by a process that had no existing or unwaited-for child processes.                                                                                                                                                                                                                                                |
| 11         | A fork failed because the system's process table is full or the user is not allowed to create any more processes. This may occur under system overload.                                                                                                                                                                               |
| 12         | During an exec or break, a program asks for more space than the system is able to supply. This is not a temporary condition, the maximum space size is a system parameter. The error may also occur if the arrangement of text, data, and stack segments requires too many segments, or if there is not enough swap space for a fork. |
| 13         | An attempt was made to access a file in a way forbidden by the protection system.                                                                                                                                                                                                                                                     |
| 14         | The system encountered a hardware fault in attempting to use an argument of a system call.                                                                                                                                                                                                                                            |
| 15         | A non-block file was mentioned where a block device was required, for example, in mount.                                                                                                                                                                                                                                              |
| 16         | An attempt was made to mount a device that was already mounted or to dismount a device on which there is an active file (open file, current directory, mounted-on file, active text segment).                                                                                                                                         |
| 17         | An existing file was mentioned in an inappropriate context, for example, link.                                                                                                                                                                                                                                                        |
| 18         | A link to a file on another device was attempted.                                                                                                                                                                                                                                                                                     |
| 19         | An attempt was made to apply an inappropriate system call to a device, for example, read a write-only device.                                                                                                                                                                                                                         |
| 20         | A non-directory was specified where a directory is required, for example, in a path prefix or as an argument to chdir.                                                                                                                                                                                                                |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (cont'd)

| Error Code | Explanation of Error Code                                                                                                                                                                                    |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 21         | An attempt was made to write on a directory.                                                                                                                                                                 |
| 22         | An invalid argument (for example, dismounting a non-mounted device, mentioning an undefined signal in signal, or kill, reading or writing a file for which lseek has generated a negative pointer) was used. |
| 23         | The system's table of open files is full, and temporarily no more opens can be accepted.                                                                                                                     |
| 24         | No process may have more than 20 file descriptors open at a time. An attempt to open the 21st was made.                                                                                                      |
| 25         | The file given to a stty or gtty does not correspond to a device, for example a terminal, to which those calls apply.                                                                                        |
| 26         | An attempt to execute a pure-procedure program which is currently open for writing (or reading). Also an attempt to open for writing a pure-procedure program that is being executed.                        |
| 27         | The size of a file exceeded the maximum file size (1,082,201,088 bytes).                                                                                                                                     |
| 28         | During a write to an ordinary file, there was no free space left on the device.                                                                                                                              |
| 29         | An lseek was issued to a pipe or to a device not supporting seeks.                                                                                                                                           |
| 30         | An attempt to modify a file or directory was made on a device mounted read-only.                                                                                                                             |
| 31         | An attempt was made to make more than the maximum number of links to a file.                                                                                                                                 |
| 32         | A write on a pipe for which there is no process to read the data. This condition normally generates a signal, the error is returned if the signal is ignored.                                                |

SEE PROPRIETARY NOTICE ON COVER PAGE

TABLE 1 (cont'd)

| Error Code | Explanation of Error Code                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 35         | A message of the requested type is not on the message queue.                                                                         |
| 36         | An attempt was made either to use a facility that must first be allocated or to allocate a facility in a way other than as intended. |
| 39         | A block was accessed that has never been written or initialized.                                                                     |
| 40         | A contiguous file cannot be moved.                                                                                                   |
| 41         | A contiguous file has exhausted the maximum number of extents and cannot grow anymore.                                               |
| 42         | There are too many characters in an absolute pathname.                                                                               |
| 43         | One of the system tables necessary to complete the request is temporarily full.                                                      |
| 44         | A request was made to a driver for a service which the driver does not support.                                                      |

#### 4. ACTION TO BE TAKEN

If action to take is not obvious from description of trouble cause, seek technical assistance. Specific actions to be taken are not given for each code. It is expected that the trouble will be internal to the programs and that technical assistance will be required. However, there are some instances where the trouble can be corrected by manual action, for example, putting a tape unit on-line, installing a write ring on a tape, or powering up a disk unit.

## 1. FORMAT

REPT SYSTEM IS IN MINIMUM CONFIGURATION MODE

## 2. REASON FOR OUTPUT

To remind the operator that the system is running in the minimum configuration mode.

## 3. VARIABLE FIELD DEFINITIONS

See Reason For Output.

## 4. ACTION TO BE TAKEN

Minimum configuration mode should only be used in extreme cases where the system will not stay up with the application running. It should only be used to diagnose or troubleshoot a system which will not recover by any other means, such as forcing configuration, inhibit options, or bootstrap options. Application software will not be started in the minimum configuration mode.

To return to full configuration mode, clear the MIN-CONFIG request on the Emergency Action Interface (EAI) page of the maintenance terminal with an EAI command 33, then bootstrap the system with an EAI command 54.

## 2. REASON FOR OUTPUT

To report any errors during the formation of the Traffic Data Administration System (TDAS) data base. TDAS data is sent from the 1B processor once every 5 minutes for Dynamic Non-Hierarchical Routing (DNHR) data and once an hour for all other data. This data must be formatted for the TDAS data base and inserted into the data base.

The other use of this message is to report the start and end of all TDAS data link sessions. A summary of data link transactions is given at the end of a TDAS data link session.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format [4] is used to output the Dynamic Non-Hierarchical Routing (DNHR) node-to-node measurement report for between 1 to 10 Toll Terminating Switches (TTSs). The output prints out for each TTS requested in the OP:DNHRMEAS input message.

Format [5] prints when the TDAS partition (dev/tdas) is not available and Format [6] prints while waiting for it to become available.

All TDAS related messages are recorded in the log file TDASLOG and may be accessed using the OP:LOG;TDASLOG input command.

### 3. VARIABLE FIELD DEFINITIONS

- a                      The process that caused the message to be printed:
- 3BREC                — 3B TDAS records process.
  - 4EVRTDAS           — 4E TDAS record process.
  - ASYN                — Synchronous data link protocol process.
  - BX25                 — Synchronous data link protocol process.
  - DNHRMEAS          — DNHR measurement process.
  - FTSG                — Formats fixed trunk subgroup data every hour.
  - MCT                 — Multiple carrier treatments process.
  - TDASMC0            — Formatter for DNHR data (MC 0) that converts twelve 5 minute files into an hour file.
  - TDASMC1            — Formatter for DNHR translation data (MC 1) that runs at 08:00 every day.
  - VTSG                — Formats variable trunk subgroup data every hour.
- b                      Measurement class that 3BREC was working on. If ?, then the measurement class was unknown.
- c                      Error code or indication of completion:
- 0 — Successful termination of process.
- 100 Series — 3BREC error codes:
- 102 — Unable to open newhour file.
  - 103 — Bad read of newhour data.
  - 104 — Bad year in TDAS MC header.
  - 105 — Bad month in TDAS MC header.
  - 106 — Bad day in TDAS MC header.
  - 107 — Bad hour in TDAS MC header
  - 108 — Bad MC number in TDAS MC header.
  - 110 — Unable to execute TDAS audit.
  - 111 — Unable to update offname file.
  - 120 — Bad ustat call in cksyntax.
  - 121 — Bad ustat call location 2 in cksyntax.
  - 122 — Bad stat call in cksyntax.
  - 130 — Bad ustat call in rmextra.
  - 131 — Not enough room to insert more data.

SEE PROPRIETARY NOTICE ON COVER PAGE

200 Series — TDASMC0 error codes:

- 201 — Unable to create /tdas/adm/mc0.
- 202 — Unable to malloc for MC 0.
- 203 — Unable to open 5 minute files.
- 204 — Unable to read 5 minute counts.
- 205 — Unable to write MC 0 header.
- 206 — Unable to write MC 0 data.
- 207 — TDASMC0 called with wrong number of arguments.
- 208 — Bad year in TDAS MC header.
- 209 — Bad month in TDAS MC header.
- 210 — Bad day in TDAS MC header.
- 211 — Bad hour in TDAS MC header.
- 212 — Bad MC number in TDAS MC header.
- 213 — MC 0 five minute counts not all in same hour.
- 214 — TDAS MC header not 18 bytes long.
- 215 — First character of MC header not Y.
- 216 — Unable to write DNHR counts.
- 217 — Unable to execute 3BREC process.
- 218 — Seek technical assistance.

300 Series — TDASMC1 errors:

- 301 — Process called with wrong number of arguments.
- 302 — TDAS MC header not 18 bytes long.
- 303 — MC header does not start with Y1.
- 304 — MC header first record not 000.
- 305 — MC header office name not 11 characters long.
- 306 — Unable to open 1Bstat file.
- 307 — Unable to read 1Bstat file.
- 308 — Unable to open 1Bfile.
- 309 — Lseek argument not 8 bytes long.
- 310 — Unable to read ht4ttsname from 1Bfile.
- 311 — Unable to create /tdas/adm/mc1.
- 312 — Unable to write /tdas/adm/mc1.
- 313 — Unable to execute 3BREC process.

400 Series — BX25 errors:

- 401 — Unable to mount /tdas partition.
- 402 — Unable to open temp file for protocol use.
- 403 — Unable to output session statistics.
- 404 — Unable to write out session statistics to output file.
- 405 — Unable to archive session statistics.
- 406 — Cannot read archive header.
- 407 — Cannot write archive file.
- 408 — Cannot write archive file header.

500 Series — ASYNC errors:

- 501 — Unable to change directory to /tdas.
- 502 — Unable to mount /tdas.
- 503 — Unable to change directory to /tdas.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 504 — Unable to open temp file for protocol use.
- 505 — Unable to create report file for session summary.
- 506 — Unable to write report file for session summary.
- 507 — Unable to open stat file.
- 508 — Unable to read stat file header.
- 509 — Unable to write stat file.
- 510 — Unable to write stat file header.

600 Series — FTSG errors:

- 600 — 629 - part of ftsgmain (trafladr 604-611).
- 630 — 649 - part of ftsgltsg.
- 650 — 674 - part of loc\_tsg.
- 675 — 677 - part of get\_tb.
- 678 — 680 - part of tsg\_out.
  
- 600 — Unable to open /dev/1astat.
- 601 — Unable to read /dev/1astat.
- 602 — Unable to open /dev/1afile\_0 or /dev/1afile\_1.
- 603 — Unable to read generic ID.
- 604 — Cannot enable message reception.
- 605 — Unable to send message to APDRV.
- 606 — Alarmed fired while waiting for message from APDRV.
- 607 — Received wrong message from APDRV.
- 608 — Unable to send message to 1B pident TRAFCLCT.
- 609 — Alarmed fired while waiting for message from TRAFCLCT.
- 610 — APS message transmission failed.
- 611 — AP\_IDENT does not contain the address of pident traf3bdt.
- 614 — Unable to read traf3bdt pident header.
- 615 — Invalid magic number.
- 616 — Cs2fs size different than in cs2fs.h.
- 617 — Unable to read dk1cs2fs.
- 618 — Unable to read traf3bdt set1 header.
- 619 — Invalid traf3bdt set number.
- 620 — Invalid traf3bdt set1 size.
- 621 — Unable to read traf3bdt set1.
- 622 — Wrong version of traf3bdt set1.
- 623 — Trunk block translator size different than in ftsgmem.c.
- 624 — Unable to read trunk block translator.
- 625 — Traf3bdt set1 couplet overlay problem (system error number equals invalid couplet).
- 626 — Unable to write ftsg output to /tdas/adm/ftsg.
- 627 — Unable to send /tdas/adm/ftsg to /prc/tdas/3brec.
- 630 — Disk trunk subgroup translator size different than in ftsgmem.c.
- 631 — Unable to read disk trunk subgroup translator.
- 632 — Disk trunk subgroup subtranslator size different than in ftsgmem.c.
- 633 — Unable to read disk trunk subgroup subtranslator.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 634 — No assigned tsgr subtranslator in disk trunk translator.
- 650 — Unable to read disk trunk subgroup subtranslator.
- 675 — Trunk block size different than in ftsgmem.c.
- 676 — Trunk block not backed up disk.
- 677 — Unable to read trunk block.
- 678 — Invalid source translator identification.

700 Series — VTSG errors:

- 799 — Cannot get the 1A generic.

800 Series — Additional error codes:

- 800 — The fork failed, skip doing Multiple Carrier Treatments (MCT) this hour.
- 801 — Failed to create Real Time Network Routing (RTNR) scratch file.
- 803 — Open failed.
- 804 — Status of tdas/adm/rxxx bombed.
- 805 — All 5 minute files must be from last hour.
- 806 — Size wrong. Not Node-To-Node Registers (NNR) multiple with 256 bytes left over.
- 807 — Size wrong.
- 808 — Read failed.
- 809 — Write failed.
- 810 — Combined fork/execute failed.
- 860 — No argument.
- 861 — Non digit ASCII byte found.
- 862 — Size is out of range.
- 863 — Open failed.
- 864 — Create failed.
- 865 — Write failed.
- 866 — Didn't copy all bytes or the file was too small.
- 867 — Open failed.
- 868 — Create failed.
- 869 — Write failed.
- 890 — Execute failed.
- 880 — MCT does not exist on this size 0.
- 881 — File /tdas/adm/mct\_ wrong size.
- 882 — File /tdas/adm/mct\_ wrong hour.
- 884 — Can't link /tdas/adm/mct\_ to /tdas/adm/mct\_\_.
- 885 — Failed to open /tdas/adm/mct\_\_.
- 886 — Read on /tdas/adm/mct\_\_ failed.
- 887 — Open failed on /tdas/adm/mct.
- 888 — Write of /tdas/adm/mct failed.
- 889 — prc/tdas3brec execute failed.

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

REPT TLP ERROR a [PACK = b] [ERRNO = c]

## 2. REASON FOR OUTPUT

To report an error condition in the Trouble Locating Procedure (TLP) user process.

## 3. VARIABLE FIELD DEFINITIONS

- a                      Error condition:
- 1 — open Equipment Configuration Database (ECD) failure
  - 2 — close ECD failure
  - 3 — ugucbn failure
  - 4 — Moving Head Disk (MHD) drive type not specified
  - 5 — bad entry in pack location file
  - 6 — pack location function failed
- b                      Circuit pack number obtained from trouble location database.
- c                      Error code returned by the failing functional call. See System Error Codes Output Appendix, APP:SYSERR.

## 4. ACTION TO BE TAKEN

If a = 1-4 an operating system function call is failing, seek technical assistance to clear the trouble.

If a = 5, verify circuit pack number exists in unit's pack location file and verify that the index in the pack location file for the circuit pack number is valid. There is one pack location file for each unit in the directory /diag/datatbl/tlp/misc. The files are named:

p.cu.0\_10  
p.dfc.21\_22  
p.duic.28\_30  
p.iop.20\_21  
p.mhd.22\_23  
p.mtc.24\_25  
p.mttyc.27\_28  
p.scsdc.25\_26  
p.sdlc.28\_29  
p.ttyc.23\_24

If the entry is correct, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

If a = 6, verify that the model, mv, hv, and equipage values in the unit(s) Unit Control Block (UCB) are correct, using Recent Change and Verify (RC/V). If UCB(s) are correct, seek technical assistance.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

REPT TIMECHECK NSC a MSG SEND FAILED- b

## 2. REASON FOR OUTPUT

Starting at 21 minutes past every hour, TIMECHECK sends a status input message for each possible equipped NSC frame to repaint each active NSC frame's overview and detail display pages with its current hardware status. The time for each active NSC frame is also compared to APS time. The input status command message failed on the RTR sendp() call for one of two reasons. The first being the indir process is not in core, or its message port is currently full.

## 3. VARIABLE FIELD DEFINITIONS

a                      Frame number.  
b                      RTR sendp() system error return explanation.

## 4. ACTION TO BE TAKEN

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... REPT:TOKEN-TRACK  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

This message has two output formats:

- [1] REPT TOKEN TRACK  
TOKEN WAS LOST BETWEEN a AND a b  
C C C C
- [2] REPT TOKEN TRACK  
SEARCH FOR TOKEN WAS UNSUCCESSFUL d: REASON e  
C C C C C  
C C C C C

## 2. REASON FOR OUTPUT

Format 1: This message indicates the vicinity of the lost token. The token could have been lost anywhere between these nodes (inclusive). This message also specifies the ring on which the token was lost but in some cases it could not determine the ring.

Format 2: This message indicates the token-track software could not search for the lost token.

## 3. VARIABLE FIELD DEFINITIONS

- a The nodes that are associated with the last token flip-flop transition.
- b The Ring ID (ON Ring 0 or ON Ring 1) or RING NOT DETERMINED.
- c A 32-bit word of internal information, passed by the token-track software, that is primarily intended for BTL use.
- d The Ring ID (ON Ring 0 or ON Ring 1) or ON BOTH RINGS.
- e Reason why token search was unsuccessful (1 - 7).
- 1 — The message used to send token track flip-flop equipped information from the 3B to all RPCs was unsuccessful.
  - 2 — The attempt to select a control RPC to collect token track information from the ring was unsuccessful.
  - 3 — Forced read operation to remove messages from one of the rings was unsuccessful.
  - 4 — Operation to place ring nodes in the user silence state was unsuccessful.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 5 — Ring fault exists on the ring (i.e., a fault that prevents any data from propagating on the ring)
- 6 — The ring nodes reported unreliable information to the Token-Track software.
- 7 — The ring contains less than the minimum number of token track flip-flop equipped nodes.

#### **4. ACTION TO BE TAKEN**

At present, no software action is taken when these token-track messages are printed. However, the information contained in these messages is useful in identifying faults on the ring. Of particular interest is Format 1, which pinpoints the area of the ring where the token disappeared. In the event of Format 2 the token track was not able to perform its task of finding the lost token because of one of the reasons previously stated. After this message the ring error analysis and recovery software should automatically restore ring operation.

## 1. FORMAT

- [1] REPT TTY a {ERROR b [c] [COMPLETED CODE d]|  
UNIDENTIFIED RESPONSE WD1=e WD2=f}
- [2] REPT TTY a STARTED
- [3] REPT TTY a STOPPED

## 2. REASON FOR OUTPUT

Format 1 reports a Teletypewriter (TTY) related software or hardware error.

Format 2 reports that the TTY has changed state from Standby (STBY) to Active (ACT). A TTY will change to ACT state when Data Terminal Ready (DTR) is ON.

Format 3 reports that the TTY has changed state from ACT to STBY. A TTY will change to STBY state when DTR is OFF.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Identifies, in hexadecimal, the point within the Input/Output Driver (IODRV) where a software or hardware error was detected. See Input/Output Processor (IOP) Output Appendix F, APP:IOP-F.
- c Character string giving more information about the error identified in b. Refer to IOP Output Appendix F, APP:IOP-F for additional explanation.
- d Hardware error type, in hexadecimal. See IOP Output Appendix A, APP:IOP-A.
- e First word of an unidentified completion report.
- f Second word of an unidentified completion report.

## 4. ACTION TO BE TAKEN

Format 1 indicates error conditions that could cause the removal of a unit. Any removed unit should be repaired and then restored to service.

Formats 2 and 3 are informational messages and indicate that the TTY has changed states. An active TTY will change state to STBY when powered off, and a standby TTY will change state to ACT when powered up. No action is necessary.

- g Peripheral controller flash RAM version number.

## 4. ACTION TO BE TAKEN

Format 1 is an error message that indicates error conditions which could cause the removal of a unit. Any removed unit should be repaired and restored to service.

For Formats 2 and 3, no action is necessary unless the controller and/or its subdevices are not acting normal, or cannot be restored. Contact the service organization with the code version number and/or flash RAM version number that was used.

SEE PROPRIETARY NOTICE ON COVER PAGE

## 1. FORMAT

REPT:UDPC  
MESSAGE FROM OPC a CONTAINS UNKNOWN DPC b

## 2. REASON FOR OUTPUT

Prints when a CCS7 message is received to be routed (i.e., transferred) to an Unknown Destination Point Code (UDPC).

This output will occur only at a 2STP when that 2STP does not have routing data to the destination point code of the received message. The message can be any CCS7 signaling message for which there is no MTP routing data.

The output will be directed to the standard output and the maintenance output class. If they are the same device, only one printout will occur.

## 3. VARIABLE FIELD DEFINITIONS

- a                      The Origination Point Code (OPC) of the message.
- b                      The Destination Point Code (DPC) of the message.

## 4. ACTION TO BE TAKEN

Refer to the Operations Technical Plan.

## 2. REASON FOR OUTPUT

To report error information or actions as the result of UNIX® Level Automatic Restart Process (ULARP) child process or run command execution.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a Record name.
- b Terminated process Identification (ID).

### 4. ACTION TO BE TAKEN

If Formats 4 or 11 through 14 are printed, no action is required.

If Formats 1, 2, or 15 are printed, database access problems are indicated. Contact your technical assistance organization.

If Format 9 is printed, use the `OP:LOG` input message to read the logfile ULARP and find the error report with the same record ID number. Using the record name from the `OP:LOG` output message, get the Equipment Configuration Database (ECD) record with Recent Change and Verify (RC/V). First make sure the record contains correct information. Then check that a file exists with the pathname that is in the record, and that it is executable. If the file does not exist, copy in a correct version.

If a large number of Processor Recovery Messages (PRMs) with this step number and function code are printed, then the UNIX® shell may not be working. Check for the existence of the file `/bin/sh`. If it exists, it should have 755 permissions. If the file does not exist, copy in a correct version. If the reason for the command failure is not apparent, contact your technical assistance center.

Once the cause of the problem has been solved, enter the `INIT:ULARP` input message. This will cause ULARP to re-execute the run command(s) that failed.

If Format 3 is printed, enter an `INIT:ULARP` input message. If the error is repeated, contact your technical assistance center.

If Formats 5, 16, or 17 are printed, use the `OP:LOG` input message to read the logfile ULARP and find the error report with the same utility ID number. Using the record name from the `OP:LOG` output message, get the ECD record with RC/V. First make sure the record contains correct information. Then check that a file exists with the pathname that is in the record, and that it is executable. If the file does not exist, copy in a correct version. Once the cause of the problem has been solved, enter the `INIT:ULARP` input message. This will cause ULARP to re-execute the process(es) that failed.

If Formats 6 or 10 are printed, use the `OP:LOG` input message to read the logfile ULARPLLOG and find the error report with the same utility ID. Using the record name from the `OP:LOG` output message, get the ECD record with RC/V. Make sure the record contains correct information, because there could be something wrong with the parameters passed to the process. If the reason for the process failure is not apparent, contact your technical assistance center. After the problem has been resolved, enter the `INIT:ULARP` input message to re-execute the process.

If Format 7 is printed, use the `OP:LOG` input message to read the logfile ULARPLLOG and find the error report with the same record ID number. Using the record name from the `OP:LOG` output message, get the ECD record with RC/V. First make sure that the record

SEE PROPRIETARY NOTICE ON COVER PAGE

contains the correct information. Then check that a file exists with the pathname that is in the record, and that it is executable. If the file does not exist, copy in a correct version. After the information in the database record has been corrected, the process may be started by entering the INIT:ULARP input message.

If Format 8 is printed, use RC/V to examine the ULARP records in the full configuration ECD. For each ULARP child process, check that a file exists, and that it is executable. After replacing the erroneous files or repairing the ECD records, reboot in full configuration. If that procedure is not successful, bootstrap on backup root, and follow normal procedures for restoring the primary root file system.

If Format 18 is printed, no action is required. ULARP has discovered a child that has died but it failed to receive the death of child signal. Ularp is now restarting the process.

If Format 19 is printed, no action is required. A child of ULARP died while the system was in disk-independent operation and no execution was attempted for the child.

## 1. FORMAT

- [1] REPT UNIX INIT ERRNO a CHANID b [c]
- [2] REPT UNIX INIT CANNOT MOUNT d ERRNO e
- [3] REPT UNIX INIT CANNOT MOUNT d READ ONLY  
MOUNTING f ERRNO e

## 2. REASON FOR OUTPUT

To report a UNIX® `init` process-related error.

Format 1 indicates the process is failing to bring up a terminal. The device name will not be present if the process is failing before it has learned the name from the Equipment Configuration Database (ECD).

Format 2 indicates the process is failing to mount a file system.

Format 3 indicates the process is failing to mount a file system in a read-only mode, and is now attempting to mount the primary/backup file system.

## 3. VARIABLE FIELD DEFINITIONS

- a Errors associated with the UNIX® `init` process:
- 0x11 — INIT could not add the ECD segments to its address space.
  - 0x12 — INIT could not attach to the ECD.
  - 0x13 — INIT could not read the ECD `org` record.
  - 0x21 — INIT could not read the Unit Control Block (UCB) record for the Maintenance Teletypewriter (MTTY).
  - 0x22 — INIT could not read the `ciopt` record for the Emergency Action Interface (EAI).
  - 0x23 — INIT could not read the `eaopt` record for the EAI.
  - 0x31 — INIT could not set up a cursor to step through the records in the ECD.
  - 0x32 — INIT could not get a database record.
  - 0x33 — INIT was passed a bad channel Identification (ID).
  - 0x41 — INIT could not read the `mdct` record for the device.
  - 0x42 — INIT could not read the `getty` record for the device.
  - 0x43 — INIT could not read the UCB record for the device.
  - 0x44 — INIT could not read the `ciopt` record for the device.
  - 0x45 — INIT could not read the `ttopt` record for the device.
  - 0x46 — The device type in the `mdct` record for the device is bad.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 0x47 — The transmission speed in the ttopt record for the device is bad.
- 0x51 — INIT could not start ULARP.
- 0x52 — INIT could not start the appropriate getty.
- 0x53 — INIT could not open the device file.
- b The channel ID sent to the INIT process.
- c The name of the device. INIT will print this only if it has found a logdev record for the channel ID.
- d The name of the file system.
- e System error number. See System Error Codes Output Appendix, APP:SYSERR.
- f The name of the primary/backup file system.

#### 4. ACTION TO BE TAKEN

For Format 1:

If error code 0x11, 0x12, 0x31, or 0x32 is printed, seek technical assistance.

If error code x13, 0x21, 0x22-0x33, or 0x41-0x47 is printed, check the appropriate record(s) in the ECD.

If error code 0x51 or 0x52 is printed, check the appropriate process to make sure that it exists and is executable.

If error code 0x53 is printed, create the appropriate device file.

For Format 2, seek technical assistance.

UPD DCHN ABORTED  
c (d)

## 2. REASON FOR OUTPUT

Format 1 prints in response to a UPD:DCHN input message. Prints when ALL is specified and there are no D-channel nodes equipped.

Format 2 prints when LNa b is specified and LNa b is a non D-channel node.

Format 3 prints when D-channel node LNa b was successfully updated.

Format 4 prints when an update attempt on D-channel node LNa b was aborted. This will

SEE PROPRIETARY NOTICE ON COVER PAGE

occur if the node is not an active D-channel node. If the node is active, it will continue to operate on the original node software. That is, a transfer to newly pumped software did not occur. Other than not being an active node, some of the reasons a node update abort can occur are:

- A stop update request was received for this node.
- The pumper process reported an error in pumping new software to this node.
- A checksum made over newly pumped node software failed or was not reported to the 3B20D/3B21D.
- A failure occurred in reading the node's generic specification file identification.
- The node moved out of the active state during its update.
- Communication with the Signaling Link Monitor Kernel (SLMK) process failed.
- An update software error (ERRLOG condition) occurred.

Format 5 prints when an update attempt on D-channel node LNa b failed. Here, an attempt to transfer node operation to newly pumped node software failed, or something caused the node to be removed from service immediately after a successful transfer to the new software. This also triggered removing the node from service.

Format 6 prints when the D-channel node update job initiated by a UPD:DCHN input message has completed. Here, the term update job refers to the aggregate update attempt on every D-channel node for which an update was requested. An update attempt has been made on either all D-channel nodes or a single D-channel node as specified in the UPD:DCHN input message. Note that COMPLETED does not imply that all, or even any, of the D-channel node update attempts were successful. It simply means that an update attempt on every D-channel node requested has completed.

Format 7 prints when the D-channel node update job initiated by a UPD:DCHN input message is stopped via the STOP:UPD input message. Note that a STOP:UPD will not undo a node update that has already been completed. As with the UPD DCHN COMPLETED output message, the term update job refers to the aggregate update attempt on every D-channel node for which an update was requested. Both the UPD:DCHN and STOP:UPD input messages have an option to request action on either all D-channel nodes or a single specified D-channel node. This message will not be printed when ALL was specified on the UPD:DCHN input message, and then a single node update is stopped via the STOP:UPD input message. Here, the update on the single node is stopped, if it has not already been completed, but the overall update job is not stopped. (The one exception to this is when there is only one D-channel node equipped. Here, an update request and a stop request specifying ALL, or identifying the D-channel node itself, are one and the same.)

Format 8 prints when the D-channel node update job initiated by a UPD:DCHN input message is aborted by some undesirable event. As with the UPD DCHN COMPLETED output message, the term update job refers to the aggregate update attempt on every D-channel node for which an update was requested. Some of the undesirable events that can cause a D-channel update job to be aborted are:

SEE PROPRIETARY NOTICE ON COVER PAGE

- Excessive (two) D-channel node update failures.
- Excessive number of ring failures/recoveries during the update job.
- Node pumper process creation failures or excessive pumper process deaths/recreations during the update job.
- Excessive D-channel node pump time.
- Communication failures with the SLMK process.
- Update software error (ERRLOG condition).

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                         |
|---|-----------------------------------------------------------------------------------------------------------------------------------------|
| a | Link node group number (00-63).                                                                                                         |
| b | Link node group member number (1-15).                                                                                                   |
| c | A 32-bit hexadecimal word containing internal update job information primarily intended for Lucent Technologies, Bell Laboratories use. |
| d | The 3B20D/3B21D real-time millisecond clock value when the update job completion/stopped/aborted output message was produced.           |

### 4. ACTION TO BE TAKEN

Format 1, no action is necessary, there are no equipped D-channel nodes.

Format 2, check the node identification used in the UPD:DCHN input message since it is not recognized as being a D-channel node.

Format 3, no action is necessary, the update on this D-channel node was successful.

Format 4, use the OP:UPD input message to determine why the update on this D-channel node was aborted.

Format 5, use the OP:UPD input message to determine why the update on this D-channel node failed.

Format 6, this message is printed when the D-channel node update job has completed. To determine whether any additional action is needed, review the results of each D-channel node update attempt. Either review the individual UPD:DCHN output messages for each D-channel node update attempt or use the OP:UPD input message to obtain a summary of the update attempt on all D-channel nodes.

Format 7, no action is necessary. This message is printed to confirm that the update job has been stopped in response to the STOP:UPD input message.

Format 8, some undesirable event has caused an abort of the D-channel node update job. This must be evaluated and understood before any further updates are initiated.

## **2. REASON FOR OUTPUT**

To report the results of executing a UPD:XTSI input message.

Formats 21 and 39 are normal operational output messages.

The remaining formats indicate that an error has occurred and an explanation of the error.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                                     |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| a | The member number of the Expanded Time Slot Interchange (XTSI) frame to use the tool on.                                                            |
| b | The number of the step to be executed. A list of steps and a short description can be found in the <i>XTSI Software Update User's Guide</i> .       |
| c | The /etc/log/1bperfsu/step.data file.                                                                                                               |
| d | The number of the last step to be completed. A list of steps and a short description can be found in the <i>XTSI Software Update User's Guide</i> . |
| e | The first 15 characters of the message to be sent to the 1B.                                                                                        |
| f | The name of the file on which an error occurred either on opening, reading or creating.                                                             |
| g | Error number. In the source code, search for ERROR g (ie. ERROR 01) to find the exact location of this error.                                       |
| h | The number of the step that is to be executed next, but only if all previous steps have completed successfully.                                     |
| i | The number of the 1A file.                                                                                                                          |
| j | The type of error which occurred.                                                                                                                   |
| k | The name of the file which caused the error.                                                                                                        |
| l | The number of the error.                                                                                                                            |
| m | Number of the generic.                                                                                                                              |
| n | Address in octal.                                                                                                                                   |

### 4. ACTION TO BE TAKEN

For formats 1,3-6,8,14,25,29,34,36-38, and 40, fix the error and reenter the command.

For all other formats except 21, 30, 39, and 42, seek technical assistance.

APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

This message has eight formats.

- [1] RGP\_PRT RGRASP KERNEL DEAD  
RGP\_PRT TERMINATING
- [2] RGP\_PRT PRTCHAR ARG CNT FAILURE  
RGP\_PRT TERMINATING
- [3] RGP\_PRT KERNEL BUFFER FAILURE  
RGP\_PRT TERMINATING
- [4] RGP\_PRT RGRASP BAD PRTCHAR OST RETURN  
RGP\_PRT TERMINATING, RETURN CODE = a
- [5] RGP\_PRT RUTIL BAD MSG HDR TYPE = b
- [6] RGP\_PRT LOST NODE RGRASP MSGS  
LOST MSG CNT: c
- [7] RGP\_PRT PORT CONNECTION FAILURE  
RGP\_PRT TERMINATING, PT\_RGPU PID = d, RGP\_PRT PID =  
e
- [8] RGP\_PRT CIALIVE FAILURE  
RGP\_PRT TERMINATING, PARENT PID = f, RETURN CODE = g

## 2. REASON FOR OUTPUT

This output message indicates anomalies with the print process of the RGRASP tool.

Format 1: The RGRASP kernel has gone away.

Format 2: The print process has provided the RGRASP kernel with an invalid number of arguments.

Format 3: The print process has provided the RGRASP kernel with invalid argument values, or that the kernel buffer management has detected an illegal buffer pointer condition.

Format 4: The RGRASP kernel has returned an unrecognized error return code from the print process' operating system trap function call.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 5: A non-RGRASP message has been encountered by the RGRASP tool.

Format 6: A number of RGRASP messages were lost.

Format 7: The RGP\_PRT process failed to connect to a port.

Format 8: The RGP\_PRT process' call to cIalive() failed.

### **3. VARIABLE FIELD DEFINITIONS**

- |   |                                                   |
|---|---------------------------------------------------|
| a | The OST return code.                              |
| b | The non-RGRASP message type.                      |
| c | The number of RGRASP messages lost.               |
| d | The PT_RGPU process id.                           |
| e | The RGP_PRT process id.                           |
| f | The parent process id of RGP_PRT.                 |
| g | The return code from the cIalive() function call. |

### **4. ACTION TO BE TAKEN**

For formats 1 through 8, seek technical assistance.

Format 6 indicates that, due to some overflow condition, some messages from the node were discarded. Messages that were not discarded will still be printed.

### **5. REFERENCES**

None.

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... RMV:CU  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

RMV CU a [b][c]

## 2. REASON FOR OUTPUT

To report the result of executing a RMV:CU input message to remove a Control Unit (CU) from service.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Termination status:
- ABORTED — Remove abnormally terminated due to a system error or a fault in the remove process.
  - COMPLETED — CU removed. If the CU was removed already, COMPLETED will still print because the remove process was run to initialize the CU.
  - STOPPED — Removal denied by the system or stopped manually.
- c Reason the remove was stopped:
- 1 — Invalid unit name. Only the CU can be removed.
  - 5 — Removal denied by system.
  - 6 — Remove manually stopped.

## 4. ACTION TO BE TAKEN

If the remove was denied by the system, try switching CUs. If the result is ABORTED, determine what is wrong with the system. Interpret the REPT:CURSTRMV output message if one occurred.

## 1. FORMAT

- [1] RMV DCI a COMPLETED
- [2] RMV DCI a ABORTED [b] [c]
- [3] RMV DCI a STOPPED d
- [4] RMV DCI a TASK e MSG STARTED
- [5] RMV DCI a STOPPED MESSAGE IN PROGRESS
- [6] RMV DCI a STOPPED MESSAGE COMPLETE

## 2. REASON FOR OUTPUT

These messages report the disposition of a request to remove a Dual Serial Channel/ Computer Interconnect (DCI) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Type of error:
  - X'1 — Remove process error.
  - X'2 — Driver error.
  - [NULL] — Remove denied by driver or Configuration (CONFIG) control.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Error code. For remove process error (X'1), see output DCI Appendix F, APP:DCI-F. For driver error (X'2), see output DCI Appendix A, APP:DCI-A.
- d Error code. See output DCI Appendix G, APP:DCI-G.
- e Diagnostic task number assigned to the request.

#### **4. ACTION TO BE TAKEN**

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

RMV LNx y b [c] [d]

## 2. REASON FOR OUTPUT

To report the disposition of a request to remove a Link Node (LN) from service. The removal request is either automatic, as a result of excessive errors, or manual. A manual LN removal attempt via the RMV:LN input command is conditional upon having the signaling link not in service and can fail (ABORTED or STOPPED) or be successful (COMPLETED). An LN removal can also be reported in response to other commands listed in the Reference Section. An automatic removal is unconditional and can only be successful (COMPLETED).

## 3. VARIABLE FIELD DEFINITIONS

x A ring node (RN) group number (00-63).

y The ring node member number (1-15).

b Termination status:  
  
COMPLETED — Unit removed.  
ABORTED — Remove aborted.  
STOPPED — Remove stopped.

If b = ABORTED,

c Type of error:  
  
1 — Remove process error  
2 — Driver error

d Error code:  
  
1 — See Output APP:APPENDIX-3.  
2 — See Output APP:APPENDIX-4.

If b = STOPPED,

c Error code - See Output APP:APPENDIX-5.

## 4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

TYPE ..... Output

## 1. FORMAT

- [1] RMV MT a ABORTED [b][c]
- [2] RMV MT a COMPLETED
- [3] RMV MT a STOPPED [d]

## 2. REASON FOR OUTPUT

To report the disposition of a request to remove a Magnetic Tape (MT) from service. The removal request is either automatic, as a result of excessive errors, or manual. A manual MT removal attempt can fail (ABORTED or STOPPED), or be successful (COMPLETED). An automatic removal is always successful.

## 3. VARIABLE FIELD DEFINITIONS

- a MT member number.
- ABORTED Remove aborted.
- b Type of error:
  - X'1 — Diagnostic remove process error.
  - X'2 — Disk File Controller (DFC) or Input/Output Processor (IOP) driver error.
  - [NULL] — Remove denied by driver or CONFIG.
- c Error code. If the MT is controlled by an IOP: For a diagnostic restore process error (X'1). See IOP Output Appendix H, APP:IOP-H. For an IOP driver error (X'2). See IOP Output Appendix G, APP:IOP-G.  
  
If the MT is controlled by a DFC: For a diagnostic restore process error (X'1). See DFC Output Appendix G, APP:DFC-G. For a DFC driver error (X'2). See DFC Output Appendix A, APP:DFC-A.
- COMPLETED Unit removed.
- STOPPED Remove stopped.
- d Error code. If the MT is controlled by an IOP, see IOP Output Appendix I, APP:IOP-I. If the MT is controlled by a DFC, see DFC Output Appendix H, APP:DFC-H.

## 4. ACTION TO BE TAKEN

If the remove was denied or aborted, clear the source of trouble and attempt the remove again.

SEE PROPRIETARY NOTICE ON COVER PAGE

- [3] RMV MTC a STOPPED d
- [4] RMV MTC a TASK e MSG STARTED
- [5] RMV MTC a STOPPED MESSAGE IN PROGRESS
- [6] RMV MTC a STOPPED MESSAGE COMPLETE

## 2. REASON FOR OUTPUT

To report the disposition of a request to remove a Magnetic Tape Controller (MTC) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Type of error:
  - X'1 — Remove process error.
  - X'2 — Driver error.
  - [NULL] — Remove denied by driver or Configuration (CONFIG) control.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Error code. For remove process error (X'1), see output IOP Appendix H, APP:IOP-H. For driver error (X'2), see output IOP Appendix G, APP:IOP-G.
- d Error code. See output IOP Appendix I, APP:IOP-I.
- e Diagnostic task number assigned to the request.

#### **4. ACTION TO BE TAKEN**

ID ..... RMV:RPCN  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,IMS  
TYPE ..... Output

## 1. FORMAT

RMV RPCNx 0 b [c] [d]

## 2. REASON FOR OUTPUT

To report the disposition of a request to remove a Ring Peripheral Controller Node (RPCN) from service. The removal request is either automatic, as a result of excessive errors, or manual. A manual RPCN removal attempt is conditional upon having adequate traffic handling capacity and can fail (ABORTED or STOPPED) or be successful (COMPLETED). An automatic removal is unconditional and can only be successful (COMPLETED).

## 3. VARIABLE FIELD DEFINITIONS

x                      A Ring Node (RN) group number (00-63).

b                      Termination status:  
  
                        COMPLETED — Unit removed.  
                        ABORTED     — Remove aborted.  
                        STOPPED     — Remove stopped.

If b = ABORTED

c                      Type of error:  
  
                        1 — Remove process error.  
                        2 — Driver error.

d                      Error code:  
  
                        1 — See Output APP:APPENDIX-3.  
                        2 — See Output APP:APPENDIX-4.

If b = STOPPED

c                      Error code - See Output APP:APPENDIX-5.

## 4. ACTION TO BE TAKEN

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] RMV SBUS a b
- [2] RMV SBUS a {ABORTED|ERROR|NOT STARTED|STOPPED} [c][d]
- [3] RMV SBUS a ABORTED [e][f]
- [4] RMV SBUS a STOPPED [g]

## 2. REASON FOR OUTPUT

To report the status of a request to remove a Small Computer System Interface (SCSI) Bus (SBUS) and all the associated Moving Head Disks (MHDs) from service.

If the remove process was invoked via the RMV SBUS poke on the DFSA display page during Disk Independent Operation (DIOP) mode, a REPT:DKDIP message will precede the output message line.

Format 2 is for Command is started via the RMV SBUS poke on the DFSA display page.

Format 3 is for if ABORTED is done manually or diagnostics fail.

Format 4 is for if STOPPED is done manually or if diagnostics fail.

## 3. VARIABLE FIELD DEFINITIONS

- a SBUS member number.
- b Status of request:
  - ABORTED — The remove is aborted.
  - COMPLETED — The unit is removed.
  - ERROR — An error is encountered; the remove is aborted.
  - NOT STARTED — The remove is not started.
  - STARTED — The remove is started by DKDIP.
  - STOPPED — The remove is stopped.
- c DKDIP error codes:
  - f09 — Failed to get the UCB of the unit by name.
  - f1b — Unit is not Active (ACT).
  - f1e — Failed to open the device.
  - f20 — See DKDRV error report on the ROP.
  - f57 — Message to driver port failed.
  - f60 — Message reception failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f63 — Process timed out waiting for message.  
f67 — Failed to close special device file.  
ffe — Aborted due to phase 1.
- d            Error code. See the System Error Codes Appendix, APP:SYSERR.
- e            Type of error:  
             X'1 — Diagnostic remove process error.  
             X'2 — Driver/Disk remove process error.  
             [NULL] — Remove denied by driver or CONFIG.
- f            Error code. Diagnostic remove process. See DFC Appendix G, APP:DFC-G. Driver/Disk remove process. See DFC Appendix A, APP:DFC-A.
- g            Error code. See DFC Appendix H, APP:DFC-H.

#### 4. ACTION TO BE TAKEN

If the remove did not complete successfully, correct the source of trouble and attempt the remove again. If the error condition persists, contact the next level of technical assistance.

## 1. FORMAT

- [1] RMV TTYC a COMPLETED
- [2] RMV TTYC a ABORTED [b] [c]
- [3] RMV TTYC a STOPPED d
- [4] RMV TTYC a TASK e MSG STARTED
- [5] RMV TTYC a STOPPED MESSAGE IN PROGRESS
- [6] RMV TTYC a STOPPED MESSAGE COMPLETE

## 2. REASON FOR OUTPUT

To report the disposition of a request to remove a Teletypewriter Controller (TTYC) from service.

Format 1 reports that the removal attempt was successful.

Formats 2 and 3 report that the removal has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Type of error:
  - X'1 — Remove process error.
  - X'2 — Driver error.
  - [NULL] — Remove denied by driver or Configuration (CONFIG) control.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Error code. For remove process error (X'1), see output IOP Appendix H, APP:IOP-H. For driver error (X'2), see output IOP Appendix G, APP:IOP-G.
- d Error code. See output IOP Appendix I, APP:IOP-I.
- e Diagnostic task number assigned to the request.

#### **4. ACTION TO BE TAKEN**

If the removal was denied or aborted, clear the source of trouble and attempt the removal again.

#### **5. REFERENCES**

ID ..... RST:CU  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

RST CU a b [c]

## 2. REASON FOR OUTPUT

To report the status of executing a request to restore a Control Unit (CU) to standby status.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Request status:
- ABORTED — Restore abnormally terminated due to a system error or a fault in the restore process.
  - COMPLETED — Restore successfully completed.
  - IN PROGRESS — Restore is in progress.
  - STOPPED — Restore denied by the system or stopped manually.
- c Reason the restore was stopped:
- 1 — Invalid unit name. Only the CU can be restored.
  - 2 — CU is not Out Of Service (OOS).
  - 3 — The mate CU must be ACTIVE or INIT.
  - 4 — Diagnostic test failures for the CU.
  - 5 — Expanded Main Memory (EMM) straps do not match on both CUs.
  - 6 — The restore was terminated because of a system request (manual or automatic).

## 4. ACTION TO BE TAKEN

If the reason the restore was stopped is 2, remove the CU. If the request status is ABORTED, determine what is wrong with the system. Interpret the REPT:CURSTRMV output message if one occurred.

If the reason the restore was stopped is 4, fix the CU, or restore it unconditionally.

If the reason the restore was stopped is 5, fix the EMM straps.

APPLICATION .. 4E,3B  
TYPE ..... Output

### 1. FORMAT

- [1] RST DFC a b
- [2] RST DFC a {ABORTED|ERROR|NOT STARTED|STOPPED} [c] [d]
- [3] RST DFC a ABORTED [e] [f]
- [4] RST DFC a STOPPED [g]

### 2. REASON FOR OUTPUT

To report the status of a request to restore a Disk File Controller (DFC) to service.

If the restore process was invoked via the RST DFC poke on the DFC status page during Disk Independent Operation (DIOP) mode, a REPT:DKDIP message will precede the actual output message line.

Format 2 is if the command is started via the RST DFC poke on the DFC status page.

### 3. VARIABLE FIELD DEFINITIONS

- a DFC member number.
- b Status of request:
  - ABORTED — Restore aborted.
  - COMPLETED — Unit restored.
  - ERROR — Encountered an error, restore aborted.
  - IN PROGRESS — Unit is being initialized.
  - NOT STARTED — The restore not started.
  - STARTED — The restore was started by DKDIP.
  - STOPPED — Unit failed diagnosis.
- c DKDIP error codes:
  - f09 — Failed to get the Unit Control Block (UCB) of the unit by name.
  - f18 — Unit is not Out Of Service (OOS).
  - f1e — Failed to open the device.
  - f20 — See Disk Driver (DKDRV) error report on the Read Only Printer (ROP).
  - f57 — Message to driver port failed.
  - f60 — Message reception failure.
  - f63 — Process timed out waiting for message.
  - f67 — Failed to close special device file.
  - ffe — Aborted due to phase 1.

SEE PROPRIETARY NOTICE ON COVER PAGE

- d                    Error code. See the System Error Codes Output Appendix, APP:SYSERR.
- e                    Type of error.
- X'1 — Diagnostic restore process error.
- X'2 — DFC driver restore process error.
- [NULL] — Bootstrap restore failure.
- f                    Error code. For a diagnostic restore process error (X'1). See DFC Output Appendix G, APP:DFC-G. For a DFC driver error (X'2). See DFC Output Appendix A, APP:DFC-A.
- g                    Error code. See DFC Output Appendix H, APP:DFC-H.

#### **4. ACTION TO BE TAKEN**

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

## 1. FORMAT

[1] RST LNa b c [d] [e|f]  
  
[2] RST LNa b g  
[h|i]

## 2. REASON FOR OUTPUT

To report the disposition of a request to restore the Link Node (LN) to service. This message may also be printed due to a successful LN restart via the INIT:LN input command.

## 3. VARIABLE FIELD DEFINITIONS

a A Ring Node (RN) group number (00-63).  
b The ring node member number (1-15).  
c Termination status:  
ABORTED — Restore aborted.  
COMPLETED — Unit restored.  
STOPPED — Restore stopped.  
d Type of error:  
1 — Restore process error  
2 — Driver error  
e Error code:  
1 — See Output APP:APPENDIX-3.  
2 — See Output APP:APPENDIX-4.  
f Error code - See Output APP:APPENDIX-5.  
g Termination status:  
IN PROGRESS — Restore in progress.  
NOT STARTED — Restore not started.  
h Reason command was NOT STARTED:  
CANNOT ACCESS GENERIC SPEC FILE  
CANNOT GET MIRA'S PROCESS ID NUMBER

SEE PROPRIETARY NOTICE ON COVER PAGE

CANNOT GET NODE'S UCB FROM ECD  
CANNOT SEND A MESSAGE TO IMS USER  
IMS INITIALIZATION IN PROGRESS  
INTERVAL TIMER CANNOT BE ALLOCATED  
INVALID ACTION REQUEST  
INVALID PERMISSION ACTION  
INVALID PERMISSION MESSAGE  
NODE HAS INVALID MAJOR STATE  
NODE HAS INVALID MINOR STATE  
NODE NOT FOUND IN ECD  
NODE NOT IN ACTIVE RING  
PERMISSION REQUEST FAILED  
PERMISSION RESPONSE TIME OUT  
PERMISSION TO RESTORE NODE HAS BEEN DENIED  
REMOVAL OF NODE FAILED  
REMOVAL OF NODE WAS DENIED  
REMOVE REQUEST FAILED  
RESTORE REQUEST ALREADY IN PROGRESS  
RESTORE REQUEST NOT ACCEPTED BY MIRA  
UNKNOWN RESTORE RESULT

i

Reason command is IN PROGRESS:  
RESTORE SUCCESSFULLY QUEUED WITH MIRA

#### 4. ACTION TO BE TAKEN

Format 1: If the restoral was denied or aborted, clear the source of trouble and attempt the restoral again.

Format 2: If the termination status field indicates NOT STARTED, then use the reason command field to determine why the request was not honored. If the reason command field is one of the following, attempt the indicated action:

CANNOT ACCESS GENERIC SPEC FILE - verify Generic Spec File exists, then resubmit the restore request.

CANNOT GET MIRA'S PROCESS ID NUMBER  
RESTORE REQUEST NOT ACCEPTED BY MIRA - verify MIRA is working correctly, then resubmit the restore request.

SEE PROPRIETARY NOTICE ON COVER PAGE

IMS INITIALIZATION IN PROGRESS - wait for initialization to complete, then resubmit the restore request.

NODE NOT FOUND IN ECD  
CANNOT GET NODE'S UCB FROM ECD - verify node is equipped, then resubmit the restore request.

NODE NOT IN ACTIVE RING - include node in active ring, then resubmit the restore request.

RESTORE REQUEST ALREADY IN PROGRESS - wait until previous restore request is finished, then resubmit the restore request.

For all other values of reason command where the terminations status field is NOT STARTED or ABT, restore the node using RST:LNx y. If the node is restored successfully, then resubmit the original restore request.

## 2. REASON FOR OUTPUT

To report the disposition of a request to restore a Moving Head Disk (MHD) to service, whether bootstrap or manual. The MHD was initially in the Out Of Service (OOS) state.

If the restore process was invoked via the RST MHD poke on the DFC status page during Disk Independent Operation (DIOP) mode, a REPT:DKDIP message will precede the actual output message line.

Format 2 is if the command is started via the RST MHD poke on the DFC status page.

Format 5 is for when the application did not request to abort the restore. The disk to disk copy is being started.

**NOTE:** Relative physical block number is a physical block number of the disk which may have been adjusted by disk defect management for SMD disk drive. In order to use it in the defect table, this number may need to be readjusted.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- a MHD member number.
- b Disposition of the request.
- ABORTED — Restore aborted or was terminated.
  - COMPLETED — Unit restored to service.
  - ERROR — Encountered an error, restore aborted.
  - IN PROGRESS — MHD listed is being initialized. If MHD listed has an active mate, data is being copied from the active mate to MHD listed.
  - NOT STARTED — The restore not started.
  - STARTED — The restore was started by DKDIP.
  - STOPPED — Unit failed diagnosis.
- c DKDIP error codes:
- f09 — Failed to get the Unit Control Block (UCB) of the unit by name.
  - f0c — ugucbm( ) failed.
  - f0f — DIOP restore not allowed — mate MHD is active.
  - f12 — DIOP restore not allowed — MHD is marked essential.
  - f18 — Unit is not OOS.
  - f1e — Failed to open the device.
  - f20 — See Disk Driver (DKDRV) error report on the Read Only Printer (ROP).
  - f57 — Message to driver port failed.
  - f60 — Message reception failure.
  - f63 — Process timed out waiting for message.
  - f67 — Failed to close special device file.
  - ffe — Aborted due to phase 1.
- d Error code. See the System Error Codes Output Appendix, APP:SYSERR.
- e Type of error.
- X'1 — Diagnostic restore process error.
  - X'2 — DFC driver restore process error.
  - [NULL] — Bootstrap restore failure.
- f Error code. For a diagnostic restore process error (X'1). See DFC Output Appendix G, APP:DFC-G. For a DFC driver error (X'2). See DFC Output Appendix A, APP:DFC-A.
- g Error code. See DFC Output Appendix H, APP:DFC-H.
- h Member number.
- i First relative physical disk block number of a range that could not be read.
- j Last relative physical disk block number.
- k Member number.

### 1. FORMAT

- [1] RST MT a b
- [2] RST MT a {ABORTED|ERROR|NOT STARTED|STOPPED} [c] [d]
- [3] RST MT a ABORTED [e] [f]
- [4] RST MT a STOPPED [g]

### 2. REASON FOR OUTPUT

To report the status of a request to restore a Magnetic Tape (MT) device to service.

If the restore process was invoked via the RST MT poke on the Disk File Controller (DFC) status page during Disk Independent Operation (DIOP) mode, a REPT:DKDIP message will precede the actual output message line.

Format 2 is if the command is started via the RST MT poke on the DFC status page.

### 3. VARIABLE FIELD DEFINITIONS

- a MT member number.
- b Status of request.
  - ABORTED — Restore aborted.
  - COMPLETED — Unit restored.
  - ERROR — Encountered an error, restore aborted.
  - IN PROGRESS — Unit is being initialized.
  - NOT STARTED — The restore not started.
  - STARTED — The restore was started by DKDIP.
  - STOPPED — Unit failed diagnosis.
- c DKDIP error codes:
  - f09 — Failed to get the Unit Control Block (UCB) of the unit by name.
  - f15 — MT restore not allowed: controller is not a DFC.
  - f18 — Unit is not Out Of Service (OOS).
  - f1e — Failed to open the device.
  - f20 — See Disk Driver (DKDRV) error report on the Read Only Printer (ROP).
  - f57 — Message to driver port failed.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f60 — Message reception failure.  
f63 — Process timed out waiting for message.  
f67 — Failed to close special device file.  
ffe — Aborted due to phase 1.
- d      Error code. See the System Error Codes Output Appendix, APP:SYSERR.
- e      Type of error:  
         X'1 — Diagnostic restore process error.  
         X'2 — DFC or IOP driver error.  
         [NULL] — Restoration denied by driver or Configuration (CONFIG) control.
- f      Error code. If the MT is controlled by an IOP: For a diagnostic restore process error (X'1). See IOP Output Appendix H, APP:IOP-H. For a IOP driver error (X'2). See IOP Output Appendix G, APP:IOP-G.  
  
      If the MT is controlled by a DFC: For a diagnostic restore process error (X'1). See DFC Output Appendix G, APP:DFC-G. For a DFC driver error (X'2). See DFC Output Appendix A, APP:DFC-A.
- g      Error code. If the MT is controlled by an IOP, see IOP Output Appendix I, APP:IOP-I. If the MT is controlled by a DFC, see DFC Output Appendix H, APP:DFC-H.

#### 4. ACTION TO BE TAKEN

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

## 2. REASON FOR OUTPUT

To report the status of a request to restore a Small Computer System Interface (SCSI) Bus (SBUS) to service.

If the restore process was invoked via the RST SBUS poke on the DFC status page during Disk Independent Operation (DIOP) mode, a REPT:DKDIP output message will precede the actual output message line.

Format 2 is if the command was started via the RST SBUS poke on the DFC status page.

## 3. VARIABLE FIELD DEFINITIONS

- a SBUS member number.
- b Status of request.
  - ABORTED — Restore aborted.
  - COMPLETED — Unit restored.
  - ERROR — Encountered an error, restore aborted.
  - IN PROGRESS — Unit is being initialized.
  - NOT STARTED — The restore is not started.
  - STARTED — The restore was started by DKDIP.
  - STOPPED — Restore stopped.
- c DKDIP error codes:
  - f09 — Failed to get the Unit Control Block (UCB) of the unit by name.
  - f18 — Unit is not Out Of Service (OOS).
  - f1e — Failed to open the device.
  - f20 — See Disk Driver (DKDRV) error report on the Read Only Printer (ROP).
  - f57 — Message to driver port failed.
  - f60 — Message reception failure.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f63 — Process timed out waiting for message.  
f67 — Failed to close special device file.  
ffe — Aborted due to phase 1.
- d            Error code. See the System Error Codes Appendix, APP:SYSERR.
- e            Type of error.  
             X'1 — Diagnostic restore process error.  
             X'2 — DFC driver restore process error.  
             [NULL] — Bootstrap restore failure.
- f            Error code. For a diagnostic restore process error (X'1). See DFC Output Appendix G, APP:DFC-G.  
             For a DFC driver error (X'2). See DFC Output Appendix A, APP:DFC-A.
- g            Error code. See DFC Output Appendix H, APP:DFC-H.

#### 4. ACTION TO BE TAKEN

If the restore did not complete successfully, correct the source of trouble and attempt the restore again. If the error condition persists, contact the next level of technical assistance.

## 2. REASON FOR OUTPUT

To report the disposition of a request to restore a Scanner And Signal Distributor Controller (SCSDC) to service.

Format 1 reports that the restoration attempt was successful.

Formats 2 and 3 report that the restoration has failed.

Formats 4, 5, and 6 report the status of the request in diagnostics.

Format 4 reports that the request has begun and provides the task number.

Format 5 reports that the request has stopped and more output messages will follow.

Format 6 reports that the request has stopped and this is the last output message from diagnostics.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number.
- b Type of error:
  - X'1 — Restore process error.
  - X'2 — Driver error.
  - [NULL] — Restoration denied by driver or Configuration (CONFIG) control.

SEE PROPRIETARY NOTICE ON COVER PAGE

- c Error code. For restore process error (X'1), see output IOP Appendix H, APP:IOP-H. For driver error (X'2), see output IOP Appendix G, APP:IOP-G.
- d Error code. See output IOP Appendix I, APP:IOP-I.
- e Diagnostic task number assigned to the request.

#### **4. ACTION TO BE TAKEN**

If the restoration was denied or aborted, clear the source of trouble and attempt the restoration again.

#### **5. REFERENCES**

ID ..... SET:CLK  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] SET CLK COMPLETED  
a b
- [2] SET CLK STOPPED  
c
- [3] SET CLK COMPLETED  
a b  
WARNING - ONLY THE AM CLOCK HAS BEEN UPDATED  
IT MAY AUTOMATICALLY BE RESET LATER TO AGREE  
WITH THE SYSTEM TIME

## 2. REASON FOR OUTPUT

To report the result of executing a SET:CLK input message to set the date and time.

## 3. VARIABLE FIELD DEFINITIONS

- a Date.
- b Time.
- c Text explaining why the command was stopped.

## 4. ACTION TO BE TAKEN

Format 1 indicates successful execution. Take no action.

If Format 2 is printed, correct any command line errors and reissue the command. If the error message is not self-explanatory, seek technical assistance.

Format 3 should be printed only when the SET:CLK input message is executed on a machine running in MIN-CONFIG mode. Although Format 1 is normally printed to indicate successful execution of the input command, Format 3 may be printed under certain conditions. If the machine is running in application mode, seek technical assistance. Otherwise, the SET:CLK input message may need to be re-executed after the machine is rebooted in application mode.

## 5. REFERENCES

OMDB Keys

Formats 1 and 3 have an OMDB key of 287.

Format 2 has an OMDB key of 283.

ID ..... SET:TRAP  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,CNI  
TYPE ..... Output

## 1. FORMAT

- [1] SET TRAP  
MTRP: SET TRAP COMPL; ID ASSIGNED; ID = a
- [2] SET TRAP  
MTRP: SET TRAP FAILED; [b | c]
- [3] SET TRAP  
d  
e
- [4] SET TRAP STOPPED  
d  
f  
g COMMAND(S) INITIATED
- [5] SET TRAP  
g COMMAND(S) INITIATED

## 2. REASON FOR OUTPUT

This output message is in response to a SET:TRAP input message.

Format 1. The SET:TRAP input message has been processed successfully. The trap identification number is given so that it may be used later in other message trap input messages to identify this particular trap.

Format 2. The processing of the SET:TRAP input message has failed due to the reason being displayed.

Format 3. The specified line from the user file was not processed for the reason given. Processing of the user file then continued.

Format 4. Processing of the user file stopped. The number of SET:TRAP commands from the user file that were actually initiated is indicated.

Format 5. Processing of the user file is complete, and the number of SET:TRAP commands that were actually initiated is indicated.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOTE:** The successful processing of the SET:TRAP input message does not guarantee that the trap can be started successfully. It depends on whether a set of conditions (e.g., the status of the link nodes) can be satisfied when it is time to start the time. Diagnostics will be printed if a trap cannot be started successfully.

### 3. VARIABLE FIELD DEFINITIONS

- a                      Trap Identification number.
- b                      Reason SET:TRAP input message failed (see Action To Be Taken Section for detailed explanation).
- NO RESRC (DISK SPACE EXHAUSTED)  
                        NO RESRC (MT\_TBL ENTRY UNAVAIL)  
                        NO RESRC (MAX\_SIMTRP REACHED)  
                        LINKS NOT SAME TYPE  
                        LINK SET NOT EQUIPPED  
                        LINK TYPE NOT S6 OR S7  
                        TRAP NEEDS TOO MANY ATTRIBUTES  
                        TRAPPING ON MORE THAN xx LINKS  
                        ALL NODES ARE OOS  
                        ALL NODES ARE OCCUPIED  
                        ALL NODES ARE EITHER OOS OR OCCUPIED  
                        NO ID ASSIGNED  
                        mt\_L4parse() DATA FIELD ERROR
- NOTE:** xx = Maximum number of links allowed to be trapped on at any time.
- c                      Reason SET:TRAP input message failed (internal error condition).
- NO LINK TAG  
                        INVALID LINK TYPE  
                        INVALID LNKTAG  
                        CAN'T GET LN TBL
- d                      Command from file with error.
- e                      IMPROPER TERMINATING CHARACTER FOR COMMAND IN FILE  
                        SYNTAX ERROR FOR COMMAND IN FILE  
                        COMMAND IN FILE IS NOT SET:TRAP  
                        FILENAME OPTION CANNOT BE NESTED

SEE PROPRIETARY NOTICE ON COVER PAGE

- f NON-PRINTABLE CHARACTER IN FILE  
EXCEEDS 255 MAXIMUM NUMBER OF CHARACTERS  
EXCEEDED COMMAND MAXIMUM NUMBER
- g Number of SET : TRAP commands from user file that  
were successfully initiated.

#### 4. ACTION TO BE TAKEN

Format 1: None.

Format 2: If any of the reasons in category c are printed, seek technical assistance.

If the reason printed is:

NO RESRC (DISK SPACE EXHAUSTED)  
The fixed size disk file is full of trap results.

Retrieve desired trap results before attempting any of the following:

1. Use STOP : TRAP input message to re-initialize the disk file (all trap results will be lost);  
or
2. Enable overwrite (OVRWT) option (older trap results will be gradually lost).

NO RESRC (MT\_TBL ENTRY UNAVAIL)  
All trap entries are occupied in the message trap database.

Retrieve desired trap results before attempting the following:  
Use STOP : TRAP input message to remove any unwanted traps.

NO RESRC (MAX\_SIMTRP REACHED)  
Maximum number of simultaneous traps on the Message Trap system has been reached.

Attempt any of the following:

1. Use STOP : TRAP input message to stop any unwanted active or inhibited trap; or
2. Use STOP : TRAP input message to remove any unwanted pending trap.

LINKS NOT SAME TYPE  
Links given in the SET : TRAP input message must be either all S6 links or all S7 links.

LINK SET NOT EQUIPPED  
Link set given in the SET : TRAP input message is not equipped.

LINK TYPE NOT S6 OR S7  
Links given in the SET : TRAP input message must be either all S6 links or all S7 links.

SEE PROPRIETARY NOTICE ON COVER PAGE

**TRAP NEEDS TOO MANY ATTRIBUTES**

Input parameters are transformed into trap attributes which will be used by the link nodes to perform message matching. Realtime concerns at link nodes impose a limit on the number of attributes that can be used for trapping. The number of attributes generated from the parameters given in the SET : TRAP input message exceeds that limit.

Reduce the number of input parameters given in the SET : TRAP input message.

**TRAPPING ON MORE THAN xx LINKS**

Maximum number of links that can have trap on at any time has been reached (including the link(s) given in this SET : TRAP input message).

Attempt any of the following:

1. Retry SET : TRAP input message with fewer links; or
2. Use STOP : TRAP input message to stop any unwanted active or inhibited trap.

**ALL NODES ARE OOS**

All the link nodes of the links specified in the SET : TRAP input message are out of service.

**ALL NODES ARE OCCUPIED**

All the links specified in the SET : TRAP input message are occupied by other traps.

**ALL NODES ARE EITHER OOS OR OCCUPIED**

Message is self-explanatory. Refer to previous two items.

**NO ID ASSIGNED**

Processing difficulties. Retry later.

**mt\_L4() DATA FIELD ERROR**

Application parsing routine for layer 4 (L4) signaling messages currently not used.

Format 3: Correct the SET : TRAP command data in the user file.

Format 4: Correct the SET : TRAP command data in the user file.

Format 5: None.

COMPLETED CALCULATING CRCS FOR APP a
- [3] START CRCUPD  
CANNOT CALCULATE CRCS FOR INVALID APP b
- [4] START CRCUPD  
CANNOT CALCULATE CRCS FOR APP a REASON c

## 2. REASON FOR OUTPUT

Prints in response to a START: CRCUPD command. Formats 1 and 2 indicate that the Cyclic Redundancy Check (CRC) update has started or completed. In large application databases, it may take up to 45 minutes between the start and the completion of a CRC update. Formats 3 and 4 indicate why the CRC update cannot be started.

## 3. VARIABLE FIELD DEFINITIONS

- a Application database that is affected. Valid values are:
  - IBGTT — Inbound global title translation
  - PCPGTT — Positive call processing global title translation
  - ATP — AT&T Trigger Platform (ATP) data tables
- b Invalid application database. Valid values are 0, 1, 2 or 3.
- c Reason for failure to start calculating CRCs. Possible values:
  - 1-99 — UNIX® RTR System error, see output Appendix SYSERR-APP
  - 101 — General database failure, unsuccessful completion.
  - 105 — Item to be modified was not located.
  - 110 — Cannot add number, hash table full.
  - 111 — Cannot add number, 10-digit compaction table full.
  - 116 — Cannot add point code sub-system information, NCP table full.
  - 120 — Cannot add record, it already exists.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 123 — The dialed digit/ ANI being searched for was not found.
- 124 — Specified NPA-NXX combination was not found.
- 127 — Associated point code sub-system information does not exist.
- 141 — File descriptor is out of range.
- 143 — Error on reading from the database.
- 144 — Error on writing to the database.
- 154 — Database inconsistencies have been detected.
- 155 — Cached inconsistencies have been detected.
- 156 — The ADMINTOC or DBTOC magic number is invalid.
- 157 — Invalid database type for this application.
- 160 — Clump number is out of range for application.
- 176 — All file descriptors are active, none available.
- 180 — The replacement NPA-NXX value already exists.
- 190 — The application database value is invalid.
- 191 — The specified user identification number is invalid.
- 192 — The specified access mode is invalid.
- 193 — The specified customer identification number is invalid.
- 194 — The compaction table search chain exceeded maximum length.
- 195 — The dialed digit/ANI table search chain exceeded maximum.
- 196 — The DLN user buffer address is invalid.
- 201 — The argument 'object' is invalid.
- 202 — The argument passed in is invalid.
- 203 — The instance does not exist.
- 204 — The instance cannot be created, it exists already.
- 205 — End of object array, no more instances.
- 206 — No free IR internal buffer.
- 207 — Request IMS buffer failed.
- 208 — Build IMS header failed.
- 209 — IMS write failed.
- 212 — Data size + number of key > 480 bytes.
- 213 — Domain exceeds its buffer quota.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 215 — Argument 'domain' is invalid.
- 216 — Get \_BAD\_CHAN failure from IMS read.
- 217 — Get \_RTNMSG failure from IMS read.
- 218 — Get \_SRCMATCH failure from IMS read.
- 219 — Bad message type.
- 220 — IR event length > 508 bytes.
- 223 — Wrong queue type.

## 1. FORMAT

This message has four formats.

- [1] START DADC FEATURE COMPLETE
- [2] START DADC SDL a COMPLETE
- [3] START DADC FEATURE ABORT b
- [4] START DADC SDL a ABORT b

## 2. REASON FOR OUTPUT

To respond to input message START:DADC. Format 1 indicates that the DADC capability is allowed on a feature basis.

Format 2 indicates that action has been taken to start the specific DADC link.

Format 3 indicates that the abort on all DADC capability has been stopped.

Format 4 indicates that the abort on a particular synchronous data link (SDL) has been stopped.

## 3. VARIABLE FIELD DEFINITIONS

- a SDL unit number (40-55).
- b Abort code starting with 900.
  - 900 — DADC has to be in a field of its own.
  - 901 — Only expecting DADC.
  - 902 — Not expecting data in this third field.
  - 903 — Not expecting data in the data field.
  - 904 — Only expecting FEATURE or SDL a.
  - 905 — SDL number out of range.
  - 906 — Only expecting FEATURE or SDL a.
  - 907 — Only expecting FEATURE or SDL a.
  - 908 — Did not receive port ID from link handler.
  - 909 — Did not receive port ID from link handler.
  - 912 — Message returned was CFTNACK.
  - 913 — Device in GROW state.
  - 914 — Device in UNIQ state.

SEE PROPRIETARY NOTICE ON COVER PAGE

915 — Device in OOS state.  
916 — Device is ACT\_DOWN.  
917 — Device is ACT\_UP.

#### **4. ACTION TO BE TAKEN**

On abort formats [3] and [4], seek technical assistance.

- [5]    START DCC APP c TID t    COMPLETE  
      INPUT ERROR - g
  
- [6]    START DCC APP c TID t    COMPLETE  
      ERROR a (LINE b) -- APPDB DCC TASK FOR c CANNOT BE STARTED

## 2. REASON FOR OUTPUT

Response to the START:DCC input command. Format 1 prints if no errors were encountered and the DCC task has been started. Status on the DCC task can be obtained via the VER:DCC command. Format 2 prints if DCC has not been activated for the specified customer unit (DCC must and can be activated via the ACTV:DCC command.) Formats 3 will print if there is already a DCC task running for the specified customer unit (only one DCC per customer unit can be active at any time.) Format 4 prints if the SID argument specified in the START:DCC input command does not match the SID currently stored in the SCRATCH APPDB area (ie. the SID specified in the currently active ACTV:DCC input message). Format 5 prints if a syntax error was found in the START:DCC command that was input. Format 6 prints if internal errors are preventing the 4ESS™ Switch from activating DCC.

## 3. VARIABLE FIELD DEFINITIONS

- a                    Error number (TBD).
  
- b                    Source line number where error was found. (For NESAC troubleshooting.)
  
- c                    The name of a APPDB customer unit. Currently, only IBGTT is supported by the DCC capability.
  
- d                    Transaction ID of the DCC task that is executing.

SEE PROPRIETARY NOTICE ON COVER PAGE

         INPUT ERROR - d
- [4]     START FTA APP a FILE b   COMPLETE  
         ERROR e (LINE f) -- FTA CANNOT BE STARTED FOR a

## 2. REASON FOR OUTPUT

Response to the File Transfer and Activation (FTA) START:FTA input command. Format 1 prints if no errors were encountered and the FTA task has been started. Status on the FTA task can be obtained via the OP:FTA command. Format 2 prints if a procedural error (e.g., the command file that was requested to be activated does not exist) was encountered while attempting to perform the FTA file activation. Format 3 prints if a syntax error was found in the START:FTA command that was input. Format 4 prints if internal errors are preventing the 4ESS™ Switch from activating FTA.

## 3. VARIABLE FIELD DEFINITIONS

- a                   The name of a FTA customer application. Either:
  - IBGTT
  - OBGTT (Refers to the PCP customer)
  - CORE
- b                   A number indicating the command file that was requested to be activated via the START:FTA input command. Command files are numbered from 0 to 99. (See the OP:FTF input message for more details.)
- c                   English description of the FTA error that caused the procedural error. Can be one of:

SEE PROPRIETARY NOTICE ON COVER PAGE

FILE DOES NOT EXIST

ERROR - INCOMPATIBLE WITH 1B GENERIC

## **2. REASON FOR OUTPUT**

Response to the START:RCBUFGET input command.

Format 1 prints if no errors were encountered and the START:RCBUFGET task has been started.

Format 2 prints if the DATA keyword was not specified. This format will print every five minutes to indicate that progress is being made on the START:RCBUFGET processing.

Format 3 prints if an error was encountered when processing an individual 1B buffered Recent Change. These errors will NOT cause the START:RCBUFGET process to terminate.

Format 4 prints as each ORDER NUMBER is retrieved from the 1B. This format prints ONLY IF the DATA keyword was specified. One of formats 5-8 print at the end of the START:RCBUFGET task, if no fatal errors were encountered during early processing of this command.

Format 5 will print if no Format 3 errors were encountered.

Format 6 will print if some errors in processing individual ORDER NUMBERS were encountered. (For each of these individual errors, a Format 3 message will print.)

Formats 7 and 8 are analogous to formats 5 and 6 respectively, but print if the START:RCBUFGET task was stopped with the STOP:RCBUFGET input command.

Format 9 prints if an error was encountered during the processing of the input message syntax. The most likely error was that the optional keyword DATA was mis-spelled.

Format 10 prints if either a START:RCBUFGET or START:RCBUFPUT task is already running. (Only one of these tasks is allowed to run at any given time.)

Formats 11-18 print if an error was encountered during the processing of the START:RCBUFGET command. Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

- |        |                                                                                                                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a      | Either null or DATA, depending on whether the DATA keyword was specified on the START:RCBUFGET input message.                                                                                                    |
| b      | A positive number. Indicates the number of 1B buffered Recent Change orders that the 1B says are buffered and need to be processed.                                                                              |
| c      | A positive number. Indicates the number of 1B buffered Recent Change orders that have been retrieved and saved so far.                                                                                           |
| d      | A positive number. Indicates the number of 1B buffered Recent Change orders that have been retrieved and saved so far.                                                                                           |
| eeeeee | A six-digit number. Indicates a 1B buffered Recent Change order number.                                                                                                                                          |
| f      | A positive number. Indicates the total number of 1B buffered Recent Change orders that were processed by the START:RCBUFGET task. This includes an orders that errored during the retrieval process from the 1B. |
| g      | A positive number. Indicates the number of 1B buffered Recent Change orders that errored and were skipped during their retrieval from the 1B. (These counts are included in f in Formats 5-8).                   |

ERROR SENDING CLR:RCB
- [14] START RCBUFPUT a IN PROGRESS  
ERROR OPENING RCBUF DIRECTORY

SEE PROPRIETARY NOTICE ON COVER PAGE

- [15] START RCBUFPUT a COMPLETE  
CANNOT CONNECT TO 1B PROCESSOR
- [16] START RCBUFPUT a COMPLETE  
ERROR CHANGING TO RCBUF DIRECTORY
- [17] START RCBUFPUT a IN PROGRESS  
ERROR - 1B NOT IN UPDATE MODE
- [18] START RCBUFPUT a COMPLETE  
ERROR - INCOMPATIBLE WITH 1B GENERIC

## **2. REASON FOR OUTPUT**

Response to the START:RCBUFPUT input command.

Format 1 prints if no errors were encountered and the START:RCBUFPUT task has been started.

Format 2 prints if the DATA keyword was not specified. This format will print every five minutes to indicate that progress is being made on the START:RCBUFPUT processing.

Formats 3 and 4 print if an error was encountered when buffering individual 1B buffered Recent Changes. These errors will NOT cause the START:RCBUFPUT process to terminate.

Format 5 prints as each ORDER NUMBER is buffered in the 1B. This format prints ONLY IF the DATA keyword was specified.

One of formats 6-9 print at the end of the START:RCBUFPUT task, if no fatal errors were encountered during early processing of this command.

Format 6 will print if no Format 3 or 4 errors were encountered.

Format 7 will print if some errors in processing individual ORDER NUMBERS were encountered. (For each of these individual errors, either a Format 3 or Format 4 message will print.)

Formats 8 and 9 are analogous to formats 6 and 7 respectively, but print if the START:RCBUFPUT task was stopped with the STOP:RCBUFPUT input command.

Format 10 prints if an error was encountered during the processing of the input message syntax. The most likely error was that the optional keyword DATA was mis-spelled.

Format 11 prints if either a START:RCBUFGET or START:RCBUFPUT task is already running. (Only one of these tasks is allowed to run at any given time.)

Formats 12-18 print if an error was encountered during the processing of the START:RCBUFPUT command. Seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

### 3. VARIABLE FIELD DEFINITIONS

|        |                                                                                                                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| a      | Either null or DATA, depending on whether the DATA keyword was specified on the START:RCBUFPUT input message.                                                                                                    |
| b      | A positive number. Indicates the number of 1B buffered Recent Change orders that the 1B says are buffered and need to be processed.                                                                              |
| c      | A positive number. Indicates the number of 1B buffered Recent Change orders that have been buffered so far.                                                                                                      |
| d      | A positive number. Indicates the number of 1B buffered Recent Change orders that have been buffered saved so far.                                                                                                |
| eeeeee | A six-digit number. Indicates a 1B buffered Recent Change order number.                                                                                                                                          |
| f      | A positive number. Indicates the total number of 1B buffered Recent Change orders that were processed by the START:RCBUFPUT task. This includes an orders that errored during the buffering process with the 1B. |
| g      | A positive number. Indicates the number of 1B buffered Recent Change buffering orders that errored and were skipped during buffering to the 1B. (These counts are included in f in Formats 6-9).                 |

### 4. ACTION TO BE TAKEN

## 1. FORMAT

This message has four formats.

- [1] STOP DADC FEATURE COMPLETE
- [2] STOP DADC SDL a COMPLETE
- [3] STOP DADC FEATURE ABORT b
- [4] STOP DADC SDL a ABORT b

## 2. REASON FOR OUTPUT

To respond to input message STOP:DADC.

Format 1 indicates that the DADC capability has been stopped on a feature basis.

Format 2 indicates that action has been taken to stop the specific DADC link.

Format 3 indicates that all DADC capability has been aborted.

Format 4 indicates that DADC capability has been aborted for a particular synchronous data link (SDL).

## 3. VARIABLE FIELD DEFINITIONS

- a SDL unit number (40-55).
- b Abort code:
  - 1002 — Not expecting data in this third field.
  - 1003 — Not expecting data in the data field.
  - 1004 — Only expecting FEATURE or SDL a.
  - 1005 — SDL number out of range.
  - 1006 — Only expecting FEATURE or SDL a.
  - 1007 — With FEATURE no number is allowed.
  - 1008 — Did not receive port ID from link handler.
  - 1009 — Did not receive port ID from link handler.
  - 1012 — Message returned was CFTNACK.
  - 1013 — Device in GROW state.
  - 1014 — Device in UNIQ state.
  - 1015 — Device in STOP state.

REASON: NODE IS NOT ACTIVE
- [6] STOP DCNAUD a LNb c FAILED  
REASON: SEND MSG TO DCHAN FAILED
- [7] STOP DCNAUD a LNb c FAILED  
REASON: RECEIVED \_RTNMSG OR \_SRCMATCH MSG

## 2. REASON FOR OUTPUT

To report the termination status of the STOP:DCNAUD input message.

## 3. VARIABLE FIELD DEFINITIONS

- a Audit member. One of the following:
  - 1 — Data Blocks audit.
  - 2 — User call reference value (CRV) Table audit.
  - 3 — Network CRV Table audit.
  - 4 — Channel ID Table audit.
  - 5 — Idle Data Blocks List audit.
- b DCN group number.
- c DCN member number.

SEE PROPRIETARY NOTICE ON COVER PAGE

d                      Audit mode. One of the following:

MAN — Manual mode  
ROUT — Routine mode  
SOFT — Software mode  
UNK — Unknown mode

#### 4. ACTION TO BE TAKEN

Format 1 indicates successful execution. If the audit mode is UNK seek technical assistance; otherwise, no action is necessary.

Format 2 indicates that the Audit Control Mechanism on the DCN is under initialization. Wait until the DCN finishes initialization and retry.

Format 3 indicates that the particular audit was not running at the time the command was entered. The OP:DCNAUD input message can be used to determine the current audit status.

Format 4 indicates that the requested node is not a DCN. Retry with a correct group and member number for the DCN.

Format 5 indicates that the DCN is not active. Wait until DCN is active and retry.

Format 6 indicates that DCNAP can not send message to the DCN. Retry. If you get the same error multiple times, seek technical assistance.

Format 7 indicates that DCNAP received a returned or source matched message. Either the IMS channel is not open on the DCN or the DCN is not active.

## 1. FORMAT

This message has four formats.

- [1] STOP FTA APP a FILE b COMPLETE  
FILE ACTIVATION STOPPED
- [2] STOP FTA APP a FILE b COMPLETE  
FILE ACTIVATION NOT STOPPED - c
- [3] STOP FTA APP a FILE b COMPLETE  
INPUT ERROR - d
- [4] STOP FTA APP a FILE b COMPLETE  
ERROR e (LINE f) -- FTA CANNOT BE STOPPED FOR a

## 2. REASON FOR OUTPUT

Response to the File Transfer and Activation (FTA) STOP:FTA input command. Format 1 prints if no errors were encountered and the FTA task has been stopped. Status on the FTA task can be obtained via the OP:FTA command. Format 2 prints if a procedural error (e.g., the command file activation that was requested to be stopped was in fact not active) was encountered while attempting to perform the FTA file activation stop. Format 3 prints if a syntax error was found in the STOP:FTA command that was input. Format 4 prints if internal errors are preventing the 4ESS™ Switch from activating FTA.

## 3. VARIABLE FIELD DEFINITIONS

- a The name of an FTA customer application. Either:
  - IBGTT
  - OBGTT (Refers to the PCP customer)
  - CORE
- b A number indicating the activating command file that was requested to be stopped via the STOP:FTA input command. Command files are numbered from 0 to 99. (See the OP:FTF input message for more details.)
- c English description of the FTA error that caused the procedural error. Can be one of:

SEE PROPRIETARY NOTICE ON COVER PAGE

FILE DOES NOT EXIST  
BAD FILE NAME  
INVALID ARGUMENT  
NO SPACE  
FILE ALREADY OPENED  
FILE IS EXECUTING  
DLN INHIBIT ACTIVE  
INTERNAL ERROR  
FILE IS ALREADY EXECUTING  
FILE IS NOT EXECUTING  
APPDB RCV IS INHIBITED  
FTA IS INHIBITED  
RESPONSE FILES EXISTS

- d English description of the syntax error found in the command input.
- e Error number (TBD).
- f Source line number where error was found. (For NESAC troubleshooting.)

#### **4. ACTION TO BE TAKEN**

Format 2: Depending on the description of the error, applications of other FTA commands may correct the conditions causing the error.

Format 4: Notify NESAC.

## 3. VARIABLE FIELD DEFINITIONS

- a Link group number (0-63).
- b Link member number (1-15).
- c Number of Loopback Components (LC) specified in the EXC:LFS command line. TEST sequence progression specifier:  
 FAR — Indicates LFS test started from the farthest specified loopback component to the nearest.  
 NEAR — Indicates Link Fault Sectionalization (LFS) test started from the nearest specified loopback component to the farthest.
- d Loopback point to which the test sequence has progressed:  
 CSUL — Channel Service Unit (CSU) latching loopback.  
 CSUN — Channel Service Unit (CSU) non-latching loopback.  
 DSUL — Digital Service Unit (DSU) dataport latching loopback.  
 DSUN — Data Service Unit (DSU) non-latching loopback.  
 LID0 — Indicates test sequence has not progressed beyond the local loopback test.  
 NEI — Far-end network element interface. (Loopback select code octet value = x1000001).

SEE PROPRIETARY NOTICE ON COVER PAGE

- OCUL — Office Channel Unit (OCU) latching loopback.
- OCUN — Office Channel Unit (OCU) non-latching loopback.
- REM — Manual remote loopback.
- RPT1 — Represents non-latching loopback test for the first 56K bps local loop regenerative repeater.
- RPT2 — Represents non-latching loopback test for the second 56K bps local loop regenerative repeater.
- e Number indicates number of Digital Signal Zero (DS0) data port relative to the near-end (01-50).
- f Specifies the Loopback Component (LC):  
CSUL, CSUN, DPee, DSUL, DSUN, NEI, REM, RPT1, and RPT2.
- g Indicates repetitive (>1) or single (1) operation (1-99).
- 1 Indicates 1st operation of the loopback component.
- 2 Indicates the 2nd operation of a unique loopback component.
- h Individual evaluations of loopback tests:
- FAIL — Indicates test failure based on input criteria.
- PASS — Indicates a successful test based on input criteria.
- TINP — Indicates the designated LC is being tested.
- i Elapsed duration of measurement for individual loopback points in hours:minutes:seconds respectively.
- j Number of errored bits for this LC (0-65535).
- k Number of errored seconds for this loopback point (0-9999).
- l Bit Error Ratio (BIT-ERT) for this loopback point:  
 $x.yE-z$  (em x, y and z are integer values (0-9)).
- OVFLW Indicates overflow.
- UNFLW Indicates underflow.
- m Percent Error Free Seconds (PCT E-F-S) for this LC. Also represented as a fixed point with precision = 0.1%.

**NOTE:** The BIT-ERT and PCT E-F-S values in an intermediate report could be worse than the specified threshold, but the test will not necessarily fail (yet). This is due to a difference in the way calculations are done for reporting versus thresholding. For example, the reported BIT-ERT is calculated by dividing the number of errored bits by the total number of bits from the start of the test up to the time of the calculation (elapsed time). For thresholding, the denominator is always the number of bits for the entire specified duration. Thresholding

SEE PROPRIETARY NOTICE ON COVER PAGE

is done in this way so that the test is not overly sensitive to bit errors early in a long test.

n                      Number of lost synchronization for the loopback point (0-999).

#### **4. ACTION TO BE TAKEN**

None.

Input Messages  
EXC:LFS  
STOP:LFS

SEE PROPRIETARY NOTICE ON COVER PAGE

ID ..... STOP:OFLBOOT  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

### 1. FORMAT

- [1] STOP OFLBOOT COMPLETED
- [2] STOP OFLBOOT a  
b  
OLBSTATE LASTATE FUNCTION LINE  
c d e f
- [3] STOP OFLBOOT STARTED  
TYPE g
- [4] STOP OFLBOOT IN PROGRESS

### 2. REASON FOR OUTPUT

These messages are output to report information regarding the execution of the offline boot feature.

### 3. VARIABLE FIELD DEFINITIONS

- a Message type.
- ABORTED — Application request to stop the oflboot procedure; devices moved to the off-line side will be restored.
- INFO — For information only.
- STOPPED — Manual request to stop the oflboot procedure. If the RST option was specified, devices moved to the off-line side will be restored.
- TERMINATED — UNIX® RTR software-initiated termination of the oflboot procedure; devices moved to the off-line side will not be restored.
- b Text line:
- ABORT IN PROGRESS — Indicates a stop was issued when a stop was already in progress. The first stop could be either manual or software initiated.
- CANNOT INVOKE COMMAND ON OFFLINE SIDE — Printed if STOP:OFLBOOT is invoked on the off-line side.

SEE PROPRIETARY NOTICE ON COVER PAGE

ILLEGAL STOP OFLBOOT COMMAND — A second STOP:OFLBOOT command was issued either without the restore option or outside the time limit (one hour) to execute a STOP:OFLBOOT with the RST option.

STOP FROM OFF-LINE SIDE NOT ALLOWED — Printed if STOP:OFLBOOT is invoked from the off-line side.

- c Current offline boot state.
- d Previous offline boot state.
- e Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.
- f Line number in the function e from which the output message originated. This field is used by UNIX® RTR, in conjunction with field e, to diagnose offline boot problems.
- g Abort type, indicates how abort was initiated:  
MANUAL — Manual STOP:OFLBOOT request.  
APPLICATION — Application-initiated abort.  
SOFTWARE — UNIX® RTR-initiated termination.

#### 4. ACTION TO BE TAKEN

For Formats 1, 3, and 4, no action needs to be taken.

For Format 2, the action to be taken depends on text line:

ABORT IN PROGRESS — No action is needed; let the first stop run to completion.

CANNOT INVOKE COMMAND ON OFFLINE SIDE — Execute STOP:OFLBOOT on the on-line side.

ILLEGAL STOP OFLBOOT COMMAND — If within the 1-hour time limit (from the first STOP:OFLBOOT command), try STOP:OFLBOOT again with the RST option.

STOP FROM OFF-LINE SIDE NOT ALLOWED — Execute STOP:OFLBOOT from the on-line side.

## 2. REASON FOR OUTPUT

This output message is in response to a STOP:TRAP input message.

Format 1 results when ID ALL is specified and there are no active or inhibited traps in the Message Trap system.

Format 2 results when ID ALL is specified and there is one or more active or inhibited traps to be stopped. A list of the trap IDs that have been stopped will be displayed.

Format 3 results when ID ALL is specified and there is one or more active or inhibited traps to be stopped. However, the processing of the STOP:TRAP input message has failed due to the reason being printed.

Format 4. When one or a list of trap IDs is given along with the ID keyword, each trap specified will be stopped in the given order. This format will be printed for the traps that have been successfully stopped. One message per trap ID stopped will be printed.

Format 5. When one or a list of trap IDs is given along with the ID keyword, each trap specified will be stopped in the given order. This format results when the processing of a trap has failed due to the reason being printed. One message per ID failed will be printed.

Format 6 results when RMTID ALL is specified and there are no pending, completed, aborted or terminated traps in the Message Trap system.

Format 7 results when RMTID ALL is specified and there is one or more traps to be removed. A list of the trap IDs that have been removed will be displayed.

Format 8 results when RMTID ALL is specified and there is one or more traps to be removed. However, the processing of the STOP:TRAP input message has failed due to the reason being printed.

Format 9. When one or a list of trap IDs is given along with the RMTID keyword, each trap specified will be removed in the given order. This format will be printed for the traps that have been successfully removed. One message per trap ID removed will be printed.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 10. When one or a list of trap IDs is given along with the RMTID keyword, each trap specified will be removed in the given order. This format results when the processing of a trap has failed due to the reason being printed. One message per ID failed will be printed.

Format 11 results when the INIT keyword (disk initialization) is specified with Y option. The disk initialization is successful and it has the side-effects of inhibiting any active traps as well as removing any aborted, completed or terminated traps. All the trap results are lost.

Format 12 results when the INIT keyword (disk initialization) is specified with Y option. The disk initialization has failed due to the reason being displayed.

Format 13 results when the INIT keyword (disk initialization) is specified with N option. No action has been taken.

Format 14 results when the OVRWT keyword (disk file overwrite) is specified with Y option and the processing of the input message is successful.

Format 15 results when the OVRWT keyword (disk file overwrite) is specified with N option and the processing of the input message is successful.

Format 16 results when the OVRWT keyword (disk file overwrite) is specified with Y or N option and the processing of the input message has failed. However, the condition should be transient.

## 1. FORMAT

This message has two output formats:

- [1]     STOP UPD STOPPED  
        STOP UPDATE ALL DCHN NODES FAILED  
        c
- [2]     STOP UPD STOPPED  
        STOP UPDATE LNa b DCHN NODE FAILED  
        c

## 2. REASON FOR OUTPUT

Format 1 prints in response to a STOP:UPD input message. Prints when DCHN, ALL is specified and the message is failed.

Format 2 prints when DCHN, LNa b is specified and the message is failed.

## 3. VARIABLE FIELD DEFINITIONS

- a             The group number of the link node, with a valid range from 00 to 63.
- b             The member number of the link node, with a valid range from 1 to 15.
- c             Must be one of the following:

STOP REQUEST REJECTED, UPDATE JOB NOT RUNNING  
SINGLE NODE STOP REQUEST REJECTED,  
    UPDATE ALREADY COMPLETED  
SINGLE NODE STOP REQUEST REJECTED,  
    UPDATE WAS ATTEMPTED AND FAILED  
SINGLE NODE STOP REQUEST REJECTED,  
    UPDATE WAS ABORTED  
SINGLE NODE STOP REQUEST REJECTED,  
    NODE NOT SCHEDULED FOR UPDATE  
SINGLE NODE STOP REQUEST REJECTED,  
    UPDATE IN PROGRESS AND TOO LATE TO STOP  
STOP REQUEST IS REJECTED, UPDATE ERRLOG CONDITION

Text line:

AIM SWITCH PRECHECKS TIMED OUT — Printed when the timer for Application Integrity Monitor (AIM) SW:OFLBOOT off-line pre-checks expires. The pre-check results will default to failure.

BOOT UNSUCCESSFUL, CANNOT SWITCH — SW:OFLBOOT was requested after a completed but unsuccessful offline boot. SW:OFLBOOT is valid only after a completed, successful offline boot or after a side switch.

CANNOT ACCESS ECD — SW:OFLBOOT encountered problems accessing Recent Change And Verify (RC/V) Equipment Configuration Database (ECD) device information.

CANNOT SEND MESSAGE TO USER PROCESS, PID: — SW:OFLBOOT cannot send a message to the user process identified by its process identifier. Usually the problem is no message buffers are available.

CORRUPT ECD UCB RECORD FOR h i — SW:OFLBOOT encountered inconsistent information about a device from the off-line ECD. For example, SW:OFLBOOT accessed the RC/V ECD Unit Control Block (UCB) record for a Disk File Controller (DFC) and the device type in the UCB record is not DFC. This may indicate that the off-line ECD is corrupt.

DIAGNOSTICS IN PROGRESS — Indicates the specified device's RC/V ECD UCB record is marked "reserved." Most often this is the case when diagnostics, or other type of maintenance work, are running on a device.

INTERNAL DFC TABLE CORRUPT — Internal data or internal tables have been corrupted.

INTERNAL IOP TABLE CORRUPT — Internal data or internal tables have been corrupted.

INTERNAL UNITS TABLE CORRUPT — Internal data or internal tables have been corrupted.

LOW CORE IOPMASK CORRUPT — Data store in low core has been corrupted.

LOW CORE ORIGSIDE CORRUPT — Data store in low core has been corrupted.

NO DISK FORCED — A DFC is not forced.

NO IOP ON THE OFFLINE SIDE — Indicates that Input / Output Processor 0 (IOP 0) and Input / Output Processor 1 (IOP 1) are both on the on-line side. The switch will fail because it will not have a Maintenance Teletypewriter (MTTY) or Read Only Printer (ROP) on the other side.

SEE PROPRIETARY NOTICE ON COVER PAGE

**NOT ACTIVE** — Printed if the specified device is not in the ACT state. The incorrect state is given in variable for the device state.

**OFLBOOT NEEDS TO BE COMPLETED FIRST** — Offline boot is supported; however, one is not in progress at this time, or it is in progress but has not finished booting yet.

**OFFLINE SYSTEM IS RUNNING IN MINIMUM CONFIGURATION MODE** — Indicates the off-line side is running in minimum configuration mode. There is no AIM process on the off-line side to support offline boot; cannot side switch.

**OLBSTATE EXPECTED TO BE AFTERBOOT OR AFTERSW** — SW:OFLBOOT cannot switch due to the fact that OLBSTATE is not AFTERBOOT or AFTERSW. SW:OFLBOOT is valid only immediately after a successful offline boot or side switch.

**SWITCH FROM OFF-LINE SIDE NOT ALLOWED** — Printed if SW:OFLBOOT is invoked from the off-line side.

**SWITCH FAILED** — Serious errors are encountered during a side switch procedure. Nevertheless, the procedure may be completed if the RETROFIT option was specified. This may mean that operation will continue without call origination. If the RETROFIT option was not specified, the side switch procedure will be terminated. Note however, the system still remains inside the offline boot procedure.

**SWITCH OFFLINE SIDE COMPLETE** — The off-line side completed its portion of a side switch. This message may be found in the OLBLOG file.

**SWITCH ONLINE SIDE COMPLETE** — The on-line side completed its portion of a side switch. This message will be found only in the OLBLOG file.

**UNEXPECTED MESSAGE FROM AIM** — Indicates a message has been received unexpectedly from AIM.

- c Current offline boot state.
- d Previous offline boot state.
- e Name of the function from which the output message originated. This field is used by UNIX® RTR in diagnosing offline boot problems.
- f Line number in the function listed from which the output message originated. This field is used by UNIX® RTR, in conjunction with field e, to diagnose offline boot problems.
- g Process identification number.
- h String giving device type information. For example: CU, DFC, IOP, MHD, TTY, TTYC, and DSCH. Unit names are listed in the Member Numbers Appendix, APP:MEM-NUM-C.

SEE PROPRIETARY NOTICE ON COVER PAGE

- i Device number. A value of zero, when used with variable for device type. For example: could form DFC 0.
- j Device state.

#### 4. ACTION TO BE TAKEN

Text line:

AIM SWITCH PRECHECKS TIMED OUT — Check the OLBLOG files on the off-line side to determine if AIM is having problems; if not, try the side switch again.

BOOT UNSUCCESSFUL, CANNOT SWITCH — Try SW:OFLBOOT again with the UCL option to override the unsuccessful offline boot. **WARNING:** The boot was unsuccessful and the side switch might be too. This can potentially affect call origination.

CANNOT ACCESS ECD — Wait for the side switch to fail, then manually stop offline boot. The error is in the off-line side ECD which cannot be audited; seek technical assistance.

CANNOT SEND MESSAGE TO USER PROCESS, PID: — Try the side switch again.

CORRUPT ECD UCB RECORD FOR h i — Seek technical assistance.

DIAGNOSTICS IN PROGRESS — Wait for diagnostics to complete, fix any problems, and then try side switching again. If diagnostics are not running, the RC/V ECD UCB record is corrupt. In this case, the UCB needs to be unreserved manually or through the ECDOWN audit.

INTERNAL DFC TABLE CORRUPT — The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete. Seeking technical assistance is recommended.

INTERNAL IOP TABLE CORRUPT — The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete. Seeking technical assistance is recommended.

INTERNAL UNITS TABLE CORRUPT — The side switch will not succeed. To retry the side switch, first, stop offline boot manually; second, start another offline boot; third, try the side switch again once offline boot is complete. Seeking technical assistance is recommended.

LOW CORE IOPMASK CORRUPT — Seek technical assistance.

LOW CORE ORIGSIDE CORRUPT — Seek technical assistance.

NO DISK FORCED — Force the DFC that was previously forced; try SW:OFLBOOT again.

NO IOP ON THE OFFLINE SIDE — Try offboot with IOP 0 or IOP 1 specified. Wait for the off-line side to be booted, then try SW:OFLBOOT again.

NOT ACTIVE — Restore this device; try SW:OFLBOOT again.

SEE PROPRIETARY NOTICE ON COVER PAGE

OFLBOOT NEEDS TO BE COMPLETED FIRST — A SW:OFLBOOT can be executed only after EXC:OFLBOOT has executed successfully.

OFFLINE SYSTEM IS RUNNING IN MINIMUM CONFIGURATION MODE — To side switch, stop offboot and execute EXC:OFLBOOT without specifying the minconfig option. When this second offline boot completes, try the side switch again.

OLBSTATE EXPECTED TO BE AFTERBOOT OR AFTERSW — Wait for offline boot or side switch to complete; try SW:OFLBOOT again.

SWITCH FROM OFF-LINE SIDE NOT ALLOWED — Execute SW:OFLBOOT from the on-line side.

SWITCH FAILED — Stop offline boot; wait for it to terminate. If RETROFIT was not specified, the system will remain in offline boot. The side switch may be retried, if desired. If RETROFIT was specified, the side switch will continue; no action is needed.

SWITCH OFFLINE SIDE COMPLETE — This message is for information only; no action is needed.

SWITCH ONLINE SIDE COMPLETE — This message is for information only; no action is needed.

UNEXPECTED MESSAGE FROM AIM — Seek technical assistance.

## 1. FORMAT

- [1] SW PORTSW {ABORTED|COMPLETED|DENIED|STOPPED} FOR [a] [b]
- [2] SW PORTSW NOT STARTED  
CONFLICT WITH CURRENT SYSTEM STATUS
- [3] SW PORTSW NOT STARTED  
INVALID ID FIELD

## 2. REASON FOR OUTPUT

To report the result of executing the SW:PORTSW input message.

## 3. VARIABLE FIELD DEFINITIONS

- a Port switchable subdevice name (Maintenance Teletypewriter [MTTY] or Receive-Only Printer [ROP]).
- b Failure reason:
  - ECD ERROR—Failed due to Equipment Configuration Database (ECD) failure.
  - UNABLE TO ACCESS DRIVER—Failed due to communication failure with the Input/Output Driver (IODRV) process.
  - UNABLE TO GET DRIVER STATUS—Failed due to communication failure with the Input/Output Driver (IODRV) process.

## 4. ACTION TO BE TAKEN

For a STOPPED message, check the portswitch hardware; it should be set in the automatic position, not in position 0 or 1. Both subdevices should be restored to service.

For ABORTED and DENIED messages, check the ROP output and the IODRV log files for additional help in determining the problem. IODRV log files are /etc/log/IODRVLOG0 and /etc/log/IODRVLOG1. If necessary, seek technical assistance.

APPLICATION .. 4E  
TYPE ..... Output

## 1. FORMAT

- [1] UPD APPDL - FAILURE OPENING DATA FILE - ERR a
- [2] UPD APPDL REFRESH JOB COMPLETED
- [3] UPD APPDL SDL RECORD[b] ILLEGAL RECORD
- [4] UPD APPDL SDL RECORD[b] MISSING SEMICOLON
- [5] UPD APPDL SID PASSWORD FAILED
- [6] UPD APPDL TAG "c" WAS NOT FOUND IN DATA FILE
- [7] UPD APPDL UPDATE JOB COMPLETED
- [8] UPD APPDL TAG AND TEXT DUMP
  - [d] SDLe f
- [9] UPD APPDL DUMP JOB COMPLETED

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:APPDL command.

Format 1, the data file was not opened or found.

Format 2, a user requested refresh of pages Application Data Link (APPDL) 114 and Synchronous Data Link Controller (SDLC) 115, the job has completed successfully.

Format 3, a self checking audit of the data files content, while reading the data file, has detected an illegal record in the data file. This audit has detected a record not starting with SDL. All records must start with the character stream SDL.

Format 4, a self checking audit of the data files content, while reading the data file, has detected an illegal record in the data file. This audit has detected a record that does not contain a semicolon. All records must contain a semicolon, semicolons are used to delimit the data record into its individual parts.

Format 5, the password entered by the user is not the daily password.

Format 6, User has entered an Synchronous Data Link (SDL) number that does not exist in the data file.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 7, the user requested update to pages APPDL and SDLC has completed successfully.

Format 8, a formatted Read Only Printer (ROP) and users screen output from a users requested dump of the data file.

Format 9, Format 8 has completed.

### 3. VARIABLE FIELD DEFINITIONS

- |   |                                                                                                                                             |
|---|---------------------------------------------------------------------------------------------------------------------------------------------|
| a | Error number associated with reason for failure:                                                                                            |
|   | 1 — Not owner,                                                                                                                              |
|   | 2 — No such file or directory,                                                                                                              |
|   | 9 — Bad file number,                                                                                                                        |
|   | 13 — Permission denied,                                                                                                                     |
|   | 17 — File exists,                                                                                                                           |
|   | 24 — Too many open files,                                                                                                                   |
|   | 27 — File to large,                                                                                                                         |
|   | 28 — No space left on device.                                                                                                               |
| b | The records line number in the data file.                                                                                                   |
| c | User has entered d which is not a valid SDL number in the data file.                                                                        |
| d | Data files line number of the record for each SDL.                                                                                          |
| e | The SDL's number.                                                                                                                           |
| f | The port name associated to the SDL number. A character stream of "(NULLED)" will appear when the numbered SDL is not assigned a port name. |

### 4. ACTION TO BE TAKEN

Format 1, check the existence of file and proceed according to error given.

Format 2, for information only.

Format 3, do an UPD:APPDL;DUMP to check the data files content. The data file record has become corrupted, either copy a back up file to overwrite the data file or edit the data file an correct the offending record, being sure the record starts with "SDL".

Format 4, do an UPD:APPDL;DUMP to check the data files content. The data file record has become corrupted, either copy a back up file to overwrite the data file or edit the data file an insert a semicolon into the offending record.

Format 5, know the daily password and retry the "UPD:APPDL" command.

Format 6, do an UPD:APPDL;DUMP to check the data files content.

Formats 7, 8, and 9, for information only.

SEE PROPRIETARY NOTICE ON COVER PAGE

## 1. FORMAT

This message has two formats.

[1]     UPD APPLY REPT  
          a

[2]     UPD APPLY b

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:APPLY command.

Format 1 is output to give information about the progress of an update, or to report an error encountered while processing the update.

Format 2 is output upon termination of the process.

## 3. VARIABLE FIELD DEFINITIONS

a                   Information about the progress of an update, or report on an error encountered while processing the update. Error messages may be one of the following categories:

COFF       — reports an error in the internal format of a file  
database — reports an error in the database  
filesys    — reports an error in the file system  
internal — reports an error found by the field update code  
system     — reports a system error that occurred  
usage      — reports an error using field update

See the output Field Update Error Codes Appendix, APP:FUEC, for explanations of error codes which may appear in error messages.

b                   Termination mode of the input message UPD:APPLY-BYTER, UPD:APPLY-FILER, or UPD:APPLY-FUNCR. The mode will be either COMPLETED for successful completion or ABORTED for termination with errors.

## 4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

UPD a b

**NOTE:** Due to the large number of errors generated by field update, an Error Messages Section, which contains a detailed description of the error messages and the meanings of the error codes, is included in the *Field Update User's Guide*.

## 2. REASON FOR OUTPUT

To report the result of executing the UPD:APPLY-FILER input message.

## 3. VARIABLE FIELD DEFINITIONS

- a                    The identification field (APPLY) of the field update input message producing this output.
- b                    Messages from the field update processes. The messages may report that the update completed or that there were errors.
- COMPLETED — The input command completed successfully.
- ABORTED — The command was abnormally terminated due to a system error or an error in execution. The UPD:SYSERR output message precedes a system error. A user error is preceded by UPD:USRERR output message. A usage error (-1) and an error message will be printed if the process ABORTED because of an error encountered while executing the command.
- WARN        — The process encountered some inconsistency while executing the input command. A WARNING or WARN message is printed, but execution continues until the update is completed.

## 4. ACTION TO BE TAKEN

If b = ABORTED, consult the Error Messages Section of the *Field Update User's Guide*.

UPD AUTOCHK REPORT COMPLETED

- [2] UPD AUTOCHK IN PROGRESS
- [3] UPD AUTOCHK PASSED
- [4] UPD AUTOCHK FAILED
- [5] UPD AUTOCHK COMPLETED
- [6] UPD AUTOCHK ABORTED
- [7] UPD AUTOCHK HEALTHCHECK HAS NOT YET BEEN RUN

SEE PROPRIETARY NOTICE ON COVER PAGE

## 2. REASON FOR OUTPUT

Format 1 is in response to the UPD:AUTOCHK input message requesting a report on the status of the "health" of the switch. A short summary is printed indicating the items checked and their status at the time the report was run (ie, PASSED, FAILED, NOT CHECKED or UNABLE TO CHECK). If any of the system health check items indicate failure or unable to check, the overall status of the UPD AUTOCHK REPORT is FAILED. In addition, if inconsistencies are detected, additional information is provided.

Format 2 is in response to the UPD:AUTOCHK input message. It indicates that the request is in progress.

Format 3 is in response to the UPD:AUTOCHK input message. It indicates that the requested system health check passed.

Format 4 is in response to the UPD:AUTOCHK input message. It indicates that the requested system health check failed.

Format 5 is in response to the UPD:AUTOCHK input message. It indicates that the request has completed.

Format 6 is in response to the UPD:AUTOCHK input message. It indicates that the request has aborted.

Format 7 is in response to the UPD:AUTOCHK input message. It indicates that the requested report was not available since the system health check has not been run yet.

## 3. VARIABLE FIELD DEFINITIONS

|   |                                                                                          |
|---|------------------------------------------------------------------------------------------|
| a | Day                                                                                      |
| b | Month                                                                                    |
| c | Date                                                                                     |
| d | Year                                                                                     |
| e | Type of inconsistency. See UPD:VFYCON output message page for more detailed information. |

## 4. ACTION TO BE TAKEN

This report lists any activities or situations that may interfere with the automatic application of a Software Update (SU). If the report shows that the overall status is failed, corrective action may be necessary. However, some instances of this report require that no action be taken. These instances are:

- conflicting switch activity
- other processes are in progress

Wait until the process in question completes or until the proper amount of time, according to the information set in the office profile, has passed.

SEE PROPRIETARY NOTICE ON COVER PAGE

If the UPD:AUTOCHK report lists failures that indicate off-normal situations, request a copy of the off-normal report through the use of the OP:SYSSTAT input message. Refer to the OP:SYSSTAT input message for the correct format and take the appropriate action to correct the situation. Also, any SUs in the temporary state on the switch, must be either made official (9330 poke on the 1960 page) or backed out (9340 poke on the 1960 page). Any breakpoints that exist must be cleared. If the consistency check fails, refer to the UPD:VFYCON output message for the action to be taken according to the type of inconsistency detected.

## 1. FORMAT

UPD AUTOMATION a  
                  b  
                  {c|SU d e f}  
                  g

## 2. REASON FOR OUTPUT

To give information or status regarding Software Update (SU) Automation.

## 3. VARIABLE FIELD DEFINITIONS

- a                   Category of the message:
- HEALTH CHECK — To report information regarding the current (or last) SU Automation Health Check
- INFO — Information regarding the last SU Automation request, or information on the current automatic installation that is in progress
- INSTALL — To report on the current automatic SU installation that is already in progress.
- OFFICE PROFILE — To report on the status of the request to update the SU Automation Office Profile.
- SCHEDULE — To report on a request to schedule an SU for automatic installation, or to report the status of the current SU scheduled.
- b                   A brief text phrase providing information or describing an error related to the Software Update Automation activity.
- c                   SU — An SU name.
- Reason — Reports the reason why SU automation is inhibited.
- Info — Provides information on the health check condition for which it was requested.
- text phrase — A brief text phrase providing more information.
- SU                  The SU is scheduled for installation for the given date/time to the given installation stage.
- d                   SU stage.
- e                   SU date.

SEE PROPRIETARY NOTICE ON COVER PAGE

- |   |                                                                                |
|---|--------------------------------------------------------------------------------|
| f | SU time.                                                                       |
| g | Provides information on the health check condition for which it was requested. |

#### **4. ACTION TO BE TAKEN**

The specific action required depends on the b field in the message. Most of these reports are informational in nature.

## 1. FORMAT

This message has two formats.

[1]     UPD BKOUT REPT  
      a

[2]     UPD BKOUT b

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:BKOUT command.

Format 1 is output to give information about the progress of backing out an update, or to report an error encountered while processing the backout.

Format 2 is output upon termination of the process.

## 3. VARIABLE FIELD DEFINITIONS

a                    Information about the progress of backing out an update, or report on an error encountered while processing the backout. Error messages may be one of the following categories:

COFF            — reports an error in the internal format of a file  
database — reports an error in the database  
filesys        — reports an error in the file system  
internal — reports an error found by the field update code  
system        — reports a system error that occurred  
usage          — reports an error using field update

See the output Field Update Error Codes Appendix, APP:FUEC, for explanations of error codes which may appear in error messages.

b                    Termination mode of the input message UPD:BKOUT. The mode will be either COMPLETED for successful completion or ABORTED for termination with errors.

## 4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

SEE PROPRIETARY NOTICE ON COVER PAGE

APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

[1]     UPD BLDBOOT REPT  
          a

[2]     UPD BLDBOOT b

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:BLDBOOT command.

Format 1 is output to give information about the progress of the bldboot process, or to report an error encountered while executing the process.

Format 2 is output upon termination of the bldboot process.

## 3. VARIABLE FIELD DEFINITIONS

a               Information about the progress of an update, or report of an error encountered while processing the update. Error messages may be one of these categories:

COFF           — Reports an error in the internal format of a file.

database       — Reports an error in the database.

filesys        — Reports an error in the file system.

internal       — Reports an error found by the bldboot code.

system         — Reports a system error that occurred.

usage          — Reports an error using bldboot.

**NOTE:** See the output Field Update Error Codes Appendix, APP:FUEC, for explanations of error codes which may appear in error messages.

b               Termination mode:

ABORTED       — Termination with errors.

COMPLETED   — Successful completion.

## 4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

ID ..... UPD:BWMNIO  
WORK CENTER.. MOC  
GENERIC ..... 4AP12 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## **1. FORMAT**

This message contains 5 formats.

- [1]     UPD BWMNIO ABORTED - CAN'T FIND FILE a
- [2]     UPD BWMNIO ABORTED - CAN'T OPEN FILE a
- [3]     UPD BWMNIO ABORTED - MSGS FILE CONTAINS ERROR
- [4]     UPD BWMNIO ABORTED - MUST TERMINATE FROM 109 PAGE
- [5]     UPD BWMNIO COMPLETED

## **2. REASON FOR OUTPUT**

To report the result of executing a UPD:BWMNIO command.

## **3. VARIABLE FIELD DEFINITIONS**

a                   Name of the file the process was trying to locate or open.

## **4. ACTION TO BE TAKEN**

For formats 1 and 2 verify that the file exists. For format 3, check if the MSGS file located in the BWM directory is correct. For format 4, the field update page (109) cannot be active. Go to the 109 page and enter a poke of 401 to terminate the page.

## **5. REFERENCES**

None.

## 1. FORMAT

This message has two formats.

[1]     UPD CLR REPT  
       a

[2]     UPD CLR b

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:CLR command.

Format 1 is output to give information about the progress of clearing an update, or to report an error encountered while processing the clear.

Format 2 is output upon termination of the process.

## 3. VARIABLE FIELD DEFINITIONS

a                    Information about the progress of clearing an update, or report of an error encountered while processing the clear. Error messages may be one of the following categories:

COFF            — reports an error in the internal format 1 of a file 1  
database — reports an error in the database 1  
filesys        — reports an error in the file system  
internal — reports an error found by the field 1 update code 1  
system        — reports a system error that occurred 1  
usage          — reports an error using field update 1

See the output Field Update Error Codes Appendix, APP:FUEC, for explanations of error codes which may appear in error messages.

b                    Termination mode of the input message UPD:CLR. The mode will be either COMPLETED for successful completion, or ABORTED for termination with errors.

## 4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

## **2. REASON FOR OUTPUT**

Customer Service Computer Access Network Standards (CSCANS) reports.

Format 1 reports that a remote system tried to connect to the switch via CSCANS interface, and reports the time for this attempt.

Format 2 reports that the CSCANS file receive process (SUfilercv) could not send an upload query return message to the remote CSCANS system. The return message contains the last official Software Update (SU) number from the switch. The link is disconnected upon encountering this error.

Format 3 reports that the SUfilercv process sent a message with an invalid pathname to the SUexpand process.

Format 4 is a warning message indicating that the SUfilercv process failed to send a message to SUexpand. No SU files will be expanded.

Format 5 reports that a remote system connected to the switch successfully via CSCANS interface.

Format 6 reports that the connection over the scans data link was disconnected.

Format 7 reports that a SU download via CSCANS interface completed successfully. Files downloaded, elapsed time, and the remaining file space were also output.

Format 8 reports that no SU files were received on the switch.

Format 9 reports that the CSCANS password file was missing or had an invalid format. No SU files will be downloaded.

Format 10 reports that a security violation occurred because the password from the CSCANS system and the switch did not match. The link is disconnected upon encountering this error.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 11 reports that the remote system disconnected the data link for an unknown reason.

Format 12 reports that there is no CSCANS download currently in progress.

Format 13 reports the progress of the UPD:CSCANS-STOP input message.

Format 14 is used to report the termination of the SUfilercv process due to an error unrelated to the actual transmission of files. This message may occur either before, during or after the transmission of files.

Format 15 reports that the SUfilercv process failed to allocate working space for the password file contents.

Format 16 reports that the sugetty process did not execute SUfilercv process with correct parameters. The link is disconnected upon encountering this error.

Format 17 reports that the sugetty process did not execute SUfilercv process with password as a parameter. The link is disconnected upon encountering this error.

Format 18 reports that the SUfilercv failed to connect to its system port.

### **3. VARIABLE FIELD DEFINITIONS**

- |   |                                                                                                         |
|---|---------------------------------------------------------------------------------------------------------|
| a | The pathname that SUfilercv sent to the SUexpand process.                                               |
| b | The pathname where the SU files were stored in the switch.                                              |
| c | File space, expressed as the number of blocks before SU download session start.                         |
| d | Number of files received in current download session.                                                   |
| e | Complete pathname for the SU files received.                                                            |
| f | List of files received in current download session.                                                     |
| g | File space, in blocks, left after the current download session.                                         |
| h | Hour.                                                                                                   |
| i | Minute.                                                                                                 |
| j | Pathname of a file issued by the sending end which was not received by the CSCANS file receive process. |

SEE PROPRIETARY NOTICE ON COVER PAGE

- k** Error code specifying the reason why the file was not received by the CSCANS file receive process:
- 01 — Insufficient space on disk to store the file.
  - 02 — File length exceeds the maximum length permitted.
  - 03 — The pathname being processed matches that of a file already on disk.
  - 04 — Could not create incoming file on disk.
  - 05 — File transmission was interrupted.
- l** Code indicating reason for termination:
- 0 — Successful completion of the file transfer session.
  - 1 — Time limit to receive messages from the remote system has expired.
  - 2 — Unable to resynchronize messages with the remote sender.
  - 3 — Unable to resynchronize files with the remote sender.
  - 4 — Bad file sequence number.
  - 5 — Insufficient disk space to store incoming files.
  - 6 — Too many files interrupted.
  - 7 — An internal error occurred in the process.
  - 8 — The file receive process was terminated in response to the UPD:CSCANS-STOP input message.
  - 9 — An I/O error occurred in writing a file to disk.
  - 10 — The remote sender aborted transmission.
  - 11 — A bad disconnect message was received from the sender.
  - 12 — CSCANS password file does not exist.
  - 13 — Security violation, too many unauthorized connection attempts.
- m** Reason for termination:
- 1 — A bad argument was passed to the file receive process.
  - 2 — Failed stat call on base directory.
  - 3 — Failed ustat call on base directory.
  - 4 — Could not enable reception of messages.
  - 5 — Failed to read connect message or received invalid connect message from the remote sending system.
  - 6 — A UPD:CSCANS request failed because of invalid request message.

SEE PROPRIETARY NOTICE ON COVER PAGE

n                      The system error number. The system error number will be printed if the pathname listed is 2, 3 or 4.

#### **4. ACTION TO BE TAKEN**

Verify that all files have been received. If required, try to download software update again later.

## 1. FORMAT

UPD CSCANS REPORT:

a FILE RECEIVED UNDER b:

c

.

.

.

FILE CURRENTLY DOWNLOADING: c

ELAPSED TIME dd:dd SPACE REMAINING e

[f ERROR g]

## 2. REASON FOR OUTPUT

To report the current status of a software update download session through Customer Service Computer Access Network Standards (CSCANS) machine. This report displays the number of files received, and the name of the file currently downloading. It also displays the total time used for receiving software update files and the amount of disk space available for receiving more software update files.

## 3. VARIABLE FIELD DEFINITIONS

a The number of files received.

b Complete path name of the software update files received.

c The name of the files received.

**NOTE:** The file names displayed may not be consistent with the actual file names seen under the software update directory. This is the result of the software update expansion mechanism which changes the file name from the compressed file name to the original file name.

d The total number of hours and minutes used for receiving files, in the form of hours:minutes.

e Amount of space remaining under /etc/bwm that can be used to receive more software update files.

f Pathname of a file issued by the sending end which was not received by the CSCANS file receive process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- g                      Error code specifying the reason why the file was not received by the CSCANS file receive process:
- 01 — Insufficient space on disk to store the file.
  - 02 — File length exceeds the maximum length permitted.
  - 03 — The pathname being processed matches that of a file already on disk.
  - 04 — Could not create incoming file on disk.
  - 05 — File transmission was interrupted.

#### 4. ACTION TO BE TAKEN

Verify that all files have been received. If the software update expansion mechanism is not turned on, the file names in the software update directory should be consistent with those from CSCANS. If the software update expansion mechanism is turned on, the files in the software update directory should be the expanded version of the files sent through the CSCANS machine.

## 2. REASON FOR OUTPUT

Format 1 reports the result of executing the UPD:DISPLAY input message in verbose form.

Format 2 reports the result of executing the UPD:DISPLAY input message in normal form.

Format 3 is printed when the SUM option is chosen in UPD:DISPLAY.

Format 4 is printed when the BACKLOG option is chosen in UPD:DISPLAY.

## 3. VARIABLE FIELD DEFINITIONS

- a Unique internally assigned update number. This uniquely identifies each update record.
- b The generic identifier as it appears in the Equipment Configuration Database (ECD).
- c Software update package name.
- d Pathname of official product being updated.
- e Processor type for this update.
- f Time and date of creation of this update item, in the form weekday month day hour:minute:second year.
- g The updated process's utility identification number.
- h The process Identification (ID) of the running version of the process. This is only set for killable function replacement updates.
- i The software update package sequence number for this update which appears in the Header (HDR) file.
- j The previous software update package sequence number.
- k Pathname of a working file.
- l The sum of the saved bolo file used for verifying its integrity.
- m The current status flag for this update item, the particular flags that are set 4 per line:
  - INMEMORY — Update has been installed in incore memory.
  - OGEN — Update has been run through the overwrite generator to convert the relocatable .m file(s) into an absolute .u file.

SEE PROPRIETARY NOTICE ON COVER PAGE

OILD — Update has been run through the overwrite incremental loader.

PERMED — Update has been made official and is permanent in the system.

RECLAIMED — Update has been audited to reclaim patchspace.

RECL\_ABRT — Update aborted attempting to reclaim patchspace.

SGEN — Update has been run through system generation to recreate the boot image to include this update.

TEMPED — The new version of the product file has been installed in a temporary state.

n The attribute flag for this update item, the particular flags that are set 4 per line:

3B\_PROCESS — Update is to a process that runs on the 3B20/3B21.

ACF — Update is to an always contiguous product which means the product must always remain contiguous.

BOOTIMAGE — Update product is part of the boot image.

BYTER — Update is a byte overwrite type.

CRC\_EXTERNAL — Update has externally stored CRC value.

CRC\_INTERNAL — Update has internally stored CRC value.

FILER — Update is a file replacement type.

FUNCR — Update is a function overwrite type.

KERNAL — Update product is a kernel level process.

KILLABLE — Update product is a killable process.

NEW\_PRODUCT — This is a newly introduced update product.

PACKINFO — Update uses PACKINFO= to denote update products.

PSEUDO — This update record is a dummy update used for place holding.

SHRLIB — Update product is a shared library.

SUPERVISOR — Update product is a supervisor level process.

UFFN — Update uses UFFN= to denote update products.

o For byter updates only, the starting address of the byter overwrite.

p New byter update values.

q Old byter update values.

SEE PROPRIETARY NOTICE ON COVER PAGE

r

Status:

COMPLETED — Information to be printed for this update record is completed.

CONTINUES — Additional information to be printed for this update record.

#### **4. ACTION TO BE TAKEN**

There is no action to take since this is an only informational output message.

ID ..... UPD:FLASH  
WORK CENTER.. MOC  
GENERIC ..... 4AP14 and later  
APPLICATION .. 4E,3B  
TYPE ..... Output

## 1. FORMAT

- [1] UPD FLASH MEMORY a b STARTED
- [2] UPD FLASH MEMORY a b NOT SUPPORTED c
- [3] UPD FLASH MEMORY a b ABORTED d
- [4] UPD FLASH MEMORY a b IN PROGRESS e
- [5] UPD FLASH MEMORY a b FAILED f
- [6] UPD FLASH MEMORY a b COMPLETED

## 2. REASON FOR OUTPUT

To report the start and execution of the UPD:FLASH input message. FLASH is a device designed to be programmed in a system with a standard 5 volt supply.

## 3. VARIABLE FIELD DEFINITIONS

- a Member name:
  - HSDC
  - MTTYC
  - SCSDC
  - SDLC
  - TTYC
- b Member number (0-255).
- c Reason why the device is not supported:
  - 101 — The member name is not that of a peripheral controller which supports the updating of FLASH memory.
  - 104 — The value in the `u_mv` field of the ECD indicates that this version of the peripheral controller does not support the updating of FLASH memory.
  - 111 — The value in the `pcpackcode` field of the ECD indicates that this peripheral controller does not support the updating of FLASH memory.
  - 112 — The `u_dtype` field in the ECD does not indicate the type of peripheral controller associated with the "member name."

SEE PROPRIETARY NOTICE ON COVER PAGE

- 113 — Not allowed to update FLASH memory (lcall failed).
  - 114 — Not allowed to update FLASH memory (no permission).
  - 115 — Timeout - no response from update permission checking process.
- d Reason why the UPD:FLASH request was aborted:
- 102 — Cannot open /dev/ecd.
  - 103 — Cannot get ucb for device from ecd for device.
  - 105 — Cannot reserve ucb for device.
  - 106 — Cannot create output file used by Input/Output Driver (IODRV) to update FLASH memory.
  - 107 — Cannot send message to IODRV to update FLASH memory.
  - 108 — System indicates message there but message not from IODRV process.
  - 109 — Update FLASH memory job timed out.
  - 110 — Cannot write all of data to output file used to update FLASH memory.
  - 116 — Not enough FLASH data files to update FLASH memory.
  - 117 — More FLASH data files than are needed to update FLASH memory.
  - 118 — FLASH data file has a size other than 49160.
  - 200 — System function getdbseg failed.
  - 201 — System function lla\_iatt failed.
  - 202 — System function lla\_rdget failed.
  - 203 — Get UCB RID of possible peripheral controller unit failed.
  - 204 — Get up pointer of possible peripheral controller unit failed.
  - 205 — The up pointer does not point to an IOP.
  - 206 — The IOP to which this peripheral controlled is not in active state. The IOP must be active before the FLASH memory on the peripheral controller can be updated.
  - 207 — The peripheral controller is not in OOS state. The peripheral controller must be OOS before the FLASH memory on the board can be updated.
- e Count of the IN PROGRESS messages displayed. The first message is displayed after a message has been sent to the IODRV process requesting that the FLASH memory on the peripheral controller be updated. Subsequent messages are displayed while the FLASH memory is in the process of being updated by the IODRV process.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f Reason why the FLASH memory on the peripheral controller was not updated. Contact your technical support center for assistance.
- 10080 — Cannot get ucb into uarray.
  - 10081 — Failure returned by `proc_diag_ufm`.
  - 10082 — Invalid mv value.
  - 10083 — Could not get a timing chain entry.
  - b0000 — Timeout in peripheral controller sequence number 0.
  - b0001 — Timeout in peripheral controller sequence number 1.
  - b0002 — Timeout in peripheral controller sequence number 2.
  - b0003 — Timeout in peripheral controller sequence number 3.
  - b0004 — Timeoui in peripheral controller sequence number 4.
  - b0005 — Timeout in peripheral controller sequence number 5.
  - b0006 — Timeout in peripheral controller sequence number 6.
  - b0007 — Timeout in peripheral controller sequence number 7.
  - b0008 — Timeout in peripheral controller sequence number 8.
  - b000c — FLASH memory timeout.
  - 1a000b — Could not queue command to peripheral controller.
  - 1a000c — Could not queue command to peripheral controller.
  - 1a000d — Could not queue command to peripheral controller.
  - 1a000e — Could not queue command to peripheral controller.
  - 1a000f — Unable to get page table address to read version number.
  - 1a0010 — Could not queue command to peripheral controller.
  - 1a0011 — Could not queue command to peripheral controller.
  - 1a0012 — Could not queue command to peripheral controller.
  - 1a0013 — Unable to allocate buffer for update FLASH memory return message.
  - 1a0014 — Bad internal sequence number.
  - 1a0020 — Could not get a timing chain entry.
  - 1a0021 — Could not get a timing chain entry.
  - 1a0022 — Could not get a timing chain entry.
  - 1a0023 — Could not get a timing chain entry.
  - 1a0024 — Could not get a timing chain entry.
  - 1a0025 — Could not get a timing chain entry.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 1a0026 — Could not get a timing chain entry.
- 1b000a — Attempt to free use of pump code file failed.
- 1b000b — Cancellation of request for pump code file failed.
- 1b000c — Unable to assign a DMA slot.
- 1b000d — Could not queue command to peripheral controller.
- 1b000e — Could not queue command to peripheral controller.
- 1b000f — Could not queue command to peripheral controller.
- 1b0010 — Unable to get a page table address.
- 1b0011 — Unsuccessful return from the cfread function.
- 1b0012 — FLASH memory on the board is already being updated.
- 1b0014 — Could not get ucb associated with peripheral controller.
- 1b0015 — Cancellation of request for pump code file failed.
- 1bXX17 — All of the FLASH files are not present. XX is the relative number of the FLASH file that is not there.
- 1bXX18 — A FLASH data file has an incorrect size, not 49160. XX is the relative number of the FLASH file that is not there.
- 1b0019 — There are more FLASH data files than expected.
- 1b0020 — Could not get a timing chain entry.
- 1b0021 — Could not get a timing chain entry.
- 1b0022 — Could not get a timing chain entry.
- 1b014X — Unsuccessful read of FLASH data file. Requester stack overflow. Requester stack overflow. X is the relative number of the failing FLASH data file.
- 1b024X — Unsuccessful read of FLASH data file. File request stack overflow. X is the relative number of the failing FLASH data file.
- 1b034X — Unsuccessful read of FLASH data file. Message buffer overflow. X is the relative number of the failing FLASH data file.
- 1b044X — Unsuccessful read of FLASH data file. Failure in setting timer. X is the relative number of the failing FLASH data file.
- 1b054X — Unsuccessful read of FLASH data file. Could not open common file, bad status in ack msg. X is the relative number of the failing FLASH data file.
- 1b064X — Unsuccessful read of FLASH data file. Could not get segment number of file buffer for file manager read. X is the relative number of the failing FLASH data file.

SEE PROPRIETARY NOTICE ON COVER PAGE

- 1b074X — Unsuccessful read of FLASH data file. Memory manager unable to allocate memory for the IODRV. X is the relative number of the failing FLASH data file.
- 1b084X — Unsuccessful read of FLASH data file. Error in reading common file. X is the relative number of the failing FLASH data file.
- 1b094X — Unsuccessful read of FLASH data file. Open or read message to file manager timed out. X is the relative number of the failing FLASH data file.
- 1b0a4X — Unsuccessful read of FLASH data file. File in invalid state upon timeout. X is the relative number of the failing FLASH data file.
- 1b0b4X — Unsuccessful read of FLASH data file. Zero Length File expected for FLASH programming. X is the relative number of the failing FLASH data file.
- 1cZZ0a — Peripheral controller FLASH programming failure.
- 1cZZ0b — Peripheral controller FLASH programming failure.
- 1cZZ0c — Peripheral controller FLASH programming failure.
- 1c000d — Peripheral controller not plugged in.
- 1cZZ0e — Peripheral controller FLASH programming failure.
- 1cZZ0f — Peripheral controller FLASH programming failure.
- 1cZZ10 — Peripheral controller FLASH programming failure.
- 1cZZ11 — Peripheral controller FLASH programming failure.
- 1cZZ12 — Peripheral controller FLASH programming failure.
- 1cZZ13 — Peripheral controller FLASH programming failure.
- 1c0014 — Invalid sequence number.
- 1c0020 — Could not get a timing chain entry.
- 1c0021 — Could not get a timing chain entry.
- 1c0030 — Unidentified/unexpected response for FLASH programming from peripheral controller.
- 1c0031 — Unidentified/unexpected response for FLASH programming from peripheral controller.
- 1c0032 — Unidentified/unexpected response for FLASH programming from peripheral controller.
- 1c0033 — Unidentified/unexpected response for FLASH programming from peripheral controller.
- 1c0034 — Unidentified/unexpected response for FLASH programming from peripheral controller.

|    | 1c0037 | — Unidentified /unexpected response for FLASH programming from peripheral controller. |
|    | 1c0038 | — Unidentified /unexpected response for FLASH programming from peripheral controller. |
| ZZ |        | Failing completion code from peripheral controller.                                   |
|    | 02     | — Bad checksum on pump.                                                               |
|    | 03     | — Invalid job code.                                                                   |
|    | 04     | — Bad byte count for pump command.                                                    |
|    | 05     | — Bad restore parameters .                                                            |
|    | 06     | — Invalid pump state.                                                                 |
|    | 07     | — No PSA record found in pump file or reached end of data too soon.                   |
|    | 08     | — Failure to program FLASH memory.                                                    |
|    | 09     | — Failure to clear and erase FLASH memory.                                            |
|    | 0a     | — Amount of Data exceeds size of FLASH memory.                                        |
|    | 0b     | — Invalid hash sum over updated FLASH memory.                                         |

#### 4. ACTION TO BE TAKEN

No action is required for STARTED, IN PROGRESS, or COMPLETED messages.

ABORTED or NOT-SUPPORTED messages usually indicate that a system resource was not available or became unavailable to perform the requested task. Clear the problem causing the resource limitation and retry the input request.

For FAILED messages, contact your technical support center for assistance.

The Receive-Only Printer (ROP) output and IODRV log files can be helpful in determining the problem. IODRV log files are /etc/log/IODRVLOG0 and /etc/log/IODRVLOG1. If necessary, seek technical assistance.

## 1. FORMAT

- [1] UPD FLASH DFC a [CHECKSUM] NOT STARTED b c
- [2] UPD FLASH DFC a [CHECKSUM] STOPPED b c
- [3] UPD FLASH DFC a [CHECKSUM] ERROR b c
- [4] UPD FLASH DFC a [CHECKSUM] ABORTED b
- [5] UPD FLASH DFC a [CHECKSUM] COMPLETED d

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:FLASH;DFC input command.

## 3. VARIABLE FIELD DEFINITIONS

- a Member number of the Disk File Controller (DFC).
- b Process step or reason code:
  - f03 — Failed to open the Equipment Configuration Database (ECD).
  - f04 — See Disk Driver (DKDRV) report on the Read Only Printer (ROP).
  - f06 — Failed to get Unit Control Block (UCB) by name.
  - f07 — Invalid DFC model.
  - f08 — Unable to open the pumpfile.
  - f09 — Failed to open pumpcode file.
  - f0c — Failed to allocate buffer.
  - f0e — Failed to read the pumpfile header.
  - f13 — Failed to reserve the UCB.
  - f16 — Failed to assign SDF name for DFC.
  - f19 — Failed to open SDF for DFC.
  - f1b — Failed to enable message reception.
  - f20 — Invalid pumpcode file.
  - f25 — Unable to lseek( ) to beginning of file.
  - f2a — DFC auto pump failed.
  - f2e — DFC pump failed.
  - f31 — DFC pump failed notification.
  - f34 — Process timed out.
  - f37 — Failed to close special device file.
  - f3a — Failed to release special device file.
  - f3c — Failed to un-reserve UCB.
  - f3e — Failed to close ECD.

SEE PROPRIETARY NOTICE ON COVER PAGE

- f3f — Failed to close pumpfile.
- f41 — Unable to read pumpfile.
- f44 — Message to port failure.
- f47 — Message reception failure.
- f4c — Terminated externally with signal.
- f4e — Invalid header magic number.
- f51 — Invalid pump header.
- f54 — Unused portion of the pump header is not zero.
- f61 — Failed to read the pumpfile header.
- f63 — Invalid header magic number.
- f65 — Unable to open pumpfile.
- f67 — fw and pumpfile are incompatible - issue.
- f69 — fw and pumpfile are incompatible - generic.
- c      System error code number. See System Error Codes Output Appendix, APP:SYSERR.
- d      Pumpcode hashsum check status:
  - INVALID PUMPCODE — Pumpcode failed the hashsum check.
  - VALID PUMPCODE — Pumpcode has passed the hashsum check.

#### 4. ACTION TO BE TAKEN

A termination report specifying noncompletion that provides an error code usually indicates a system resource was not available or became unavailable to perform the requested task. The problem causing the resource limitation should be cleared and the input request retried. The pump failure can also be caused by the incompatibility between the pumpcode and firmware. The pump can also fail due to a corrupted pumpcode file. A termination report specifying completion indicates that all directives of the input request were done and no failures were encountered.

## 1. FORMAT

[1]     UPD FTRC REPT  
          a

[2]     UPD FTRC b

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:FTRC command.

Format 1 is output to give information about the progress of a function trace, or to report an error encountered while processing the function trace.

Format 2 is output upon termination of the process.

## 3. VARIABLE FIELD DEFINITIONS

a                   Information about the progress of a function trace, or report of an error encountered while processing the function trace. Error messages may be one of these categories:

COFF           — Reports an error in the internal format of a file.  
database — Reports an error in the database.  
filesys       — Reports an error in the file system.  
internal — Reports an error found by the field update code.  
system       — Reports a system error that occurred.  
usage         — Reports an error using field update.

**NOTE:** See the output Field Update Error Codes Appendix, APP:FUEC, for explanations of error codes which may appear in error messages.

b                   Termination mode:

ABORTED — Termination with errors.

COMPLETED — Successful completion.

## 4. ACTION TO BE TAKEN

No action needed for informational reports. If a command aborts, seek technical assistance.

[16] UPD GEN APPLICATION ERROR: SKIPPING RELEASES IS NOT ALLOWED!

## **2. REASON FOR OUTPUT**

To report output messages of the application retrofit process (APPLHOOK) that is used to map application specific information between 3B generics.

## **3. VARIABLE FIELD DEFINITIONS**

|   |                                                                                |
|---|--------------------------------------------------------------------------------|
| a | Time limit (in seconds) for APPLHOOK stage (i.e., ENTER, PROCEED) to complete. |
| b | APPLHOOK stage.                                                                |
| c | Name of the new generic.                                                       |
| d | File, Partition or Directory.                                                  |
| e | Path of the source file, partition or directory.                               |
| f | Path of the destination file, partition or directory.                          |
| g | Error number associated with the failed APPLHOOK job.                          |
| h | Specified APPLHOOK command.                                                    |
| i | Name of the database in the offline disk.                                      |
| j | Name of the script being applied.                                              |
| k | Reason for the aborted command.                                                |
| l | Name of the function where the error occurred.                                 |
| m | Reason for the error.                                                          |
| n | Special name used to access path to the offline root.                          |

## **4. ACTION TO BE TAKEN**

Format 1 reports the time limit for the APPLHOOK stage to complete. No action is required.

Format 2 reports the start of the APPLHOOK stage. No action is required.

Formats 3 and 5 report the start and completion of the APPLHOOK job. No action is required.

Format 4 reports that an error was encountered during the execution of the COPY job. Check if the source exists, and also check the ROP for additional information. If errors persist, contact your support organization.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 6 reports that an error was encountered during the execution of the APPLHOOK command. Check if the process exists. If it does, re-execute command. If errors persist, contact your support organization.

Format 7 reports the start and completion of a database conversion job. No action is required.

Format 8 reports that a script has failed. Check if the script exists. Check the error file for additional information about the aborted script. If error file does not provide enough information to fix the problem, contact your support organization.

Format 9 reports the completion of the APPLHOOK stage, and that control is being passed to the system update process.

Format 10 reports that a file, partition or directory does not exist. Check if the file, partition or directory exists. If it does, re-execute the command. If it does not, look for previous retrofit failures. If errors persist, contact your support organization.

Formats 11 and 12 report aborted and failed processes. Check the ROP for reason of failure. If errors persist, contact your support organization.

Format 13 reports that an invalid file, partition or directory name has been passed. Check the name again and re-execute command. If errors persist, contact your support organization.

Format 14 reports that a file, partition or directory cannot be opened for reading or writing. Check if it exists and has the proper permission. If so, re-execute. If errors persist, contact your support organization.

Format 15 reports that the office being retrofitted is not in the last generic release (R4). Contact your support organization immediately.

Format 16 reports that the office being retrofitted is skipping a release. Contact your support organization immediately.

- [8] UPD GEN APPLPROC APPLICATION PROCESS EXECUTED  
WITHOUT ARGUMENT
- [9] UPD GEN APPLPROC APPLICATION PROCESS HAS  
TERMINATED SUCCESSFULLY

## 2. REASON FOR OUTPUT

To report the execution status of the dummy application process and whether or not it was executed with an argument on the command line. If an application inserts their own application process in place of the dummy application process, these output messages may no longer be valid.

## 3. VARIABLE FIELD DEFINITIONS

See Reason For Output.

## 4. ACTION TO BE TAKEN

For Formats 1 - 9, when the dummy application process is executed, no action needs to be taken, since the dummy application process performs no actions except print out these output messages.

## 5. REFERENCES

TYPE ..... Output

## 1. FORMAT

- [1] UPD GEN BACKOUT COMPLETED
- [2] UPD GEN BACKOUT STOPPED WITH ERROR CODE a
- [3] UPD GEN BACKOUT UPON COMPLETION BOOT SYSTEM SELECTING b [c]
- [4] UPD GEN BACKOUT TRANSFERRING CONTROL TO APPLICATION
- [5] UPD GEN BACKOUT APPLICATION COMPLETION WITHIN d SECONDS
- [6] UPD GEN BACKOUT NOT STARTED CONFLICT WITH CURRENT SYSTEM STATUS

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:G-BKOUT input message, and to inform the craft as to which boot option should be used when booting the old generic.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code causing the process to stop. See the System Update Error Codes Appendix, APP:SUPR.
- b Boot options:
  - BACKUP ROOT — Select backup root on EAI.
  - MHD — Force Moving Head Disk (MHD) specified on EAI (off-line disk method only).
  - PRIMARY ROOT — Select primary root on Emergency Action Interface (EAI).
- c MHD number (0-1).
- d Number of seconds for application processing.

## 4. ACTION TO BE TAKEN

Format 1 indicates the backout process has completed. There is no action to be taken when this output occurs.

Format 2 indicates that the backout stopped due to an error. Error codes are defined in the System Update Error Codes Appendix, APP:SUPR. Along with each error code is a description of the appropriate action to take.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 indicates that the backout is completed, boot the system as directed in this message. The force for MHD {0/1} should be left in effect until instructions to remove it are output by UPD:G-COMMIT or UPD:G-RESTR output messages.

Formats 4 and 5 are informal messages and do not require any action to be taken.

Format 6 indicates that a condition exists which will not allow the UPD:G-BKOUT process to start. Possibly /prc/supr/backout does not exist or is not executable. If the file exists and is not executable, make it executable. If the file does not exist or does exist and is already executable retry the command. If the message is output again, seek technical assistance.

- [10] UPD GEN ENTER UPDATING PARTITION e IN MHD f

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:G-ENTER input message, and to provide status information and instructions concerning the update.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code causing the process to stop. See the System Update Error Codes Appendix, APP: SUPR.
- b Number of additional blocks of data written since last output message of this type.
- c Member number of disk to be forced off-line for data entry (if off-line disk method being used).
- d Number of seconds for application processing.
- e Number of a backup partition that needs to be updated from its primary.
- f Member number of off-line disk in which partition is being updated.

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

Format 1 indicates the proceed enter has completed. There is no action to be taken when this output occurs.

Format 2 indicates that enter stopped due to an error. Error codes are defined in the System Update Error Codes Appendix, APP:SUPR. Along with each error code is a description of the appropriate action to take.

Format 3 indicates to mount the appropriate tape and CONTINUE the system update procedure.

Formats 4 - 10 are informational messages and do not require any action to be taken.

- [6] UPD GEN PROCEED NOT STARTED  
CONFLICT WITH CURRENT SYSTEM STATUS

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:G-PROCD input message and to inform the craft which boot options to use when booting the new generic.

## 3. VARIABLE FIELD DEFINITIONS

- a Error code causing the process to stop. See the System Update Error Codes Appendix, APP:SUPR.
- b Boot options:
  - BACKUP ROOT — Select backup root on EAI.
  - MHD — Force Moving Head Disk (MHD) specified on EAI (off-line disk method only).
  - PRIMARY ROOT — Select primary root on Emergency Action Interface (EAI).
- c MHD number (0-1).
- d Number of seconds for application processing.

## 4. ACTION TO BE TAKEN

Format 1 indicates the proceed process has completed. There is no action to be taken.

Format 2 indicates that proceed stopped due to an error. Error codes are defined in the System Update Error Codes Appendix, APP:SUPR. Along with each error code is a description of the appropriate action to take.

SEE PROPRIETARY NOTICE ON COVER PAGE

Format 3 indicates that when the proceed is completed, boot the system as directed in this message. The force for MHD {0/1} should be left in effect until instructions to remove it are output by UPD:G-COMMIT or UPD:G-RESTR output messages.

Format 4 is an informational message and does not require any action.

Format 5 is an informational message and does not require any action.

Format 6 indicates that a condition exists which will not allow the UPD:G-PROCD process to start. Possibly /prc/supr/proceed does not exist or is not executable. If the file does not exist and is already executable retry the command. If the message is output again, seek technical assistance.

## 1. FORMAT

UPD ISG a [b [c|d]] [e]

## 2. REASON FOR OUTPUT

To report any errors encountered in an invocation of incremental System Generation (SGEN), and to report the amount of memory needed to boot from the new boot load.

## 3. VARIABLE FIELD DEFINITIONS

- a One of the descriptions of any unexpected events during processing.  
Reason for error found at beginning of output file /tmp/isgdump:
- bf\_fchk — Cannot open file listed.
  - bf\_fchk — File listed is not a single extent contiguous file.
  - bf\_init — Cannot open output file listed.
  - bf\_init — Output file listed does not have exactly the number of blocks the file should have.
  - bf\_write — Insufficient space on output file to build system.
  - bh\_put — Write failed.
  - bt\_ovrwr — Unable to open output file listed.
  - bt\_ovrwr — Unable to overwrite bootab.
  - bt\_ovrwr — Unable to write to file listed.
  - bt\_pr\_seg — Too many segments in boot image.
  - chksiz — Filesize disagrees with bootheader filesize.
  - chksiz — Unable to stat bootfile.
  - db\_getdev — Invalid device type.
  - db\_getlevl — Invalid level index.
  - db\_getpth — Failed to read sgen2 record.
  - db\_getpth — Failed to read sgen3 record.
  - db\_getpth — Invalid boot constituent.
  - db\_init — Failed to attach to database.
  - db\_init — Failed to read header record.

SEE PROPRIETARY NOTICE ON COVER PAGE

db\_init — Failed to read sgen1 record.

db\_nextbp — Failed to read sequence record.

db\_opnothr — Failed to open process sequence.

db\_parm — Invalid parameter type.

db\_pnum — No available process numbers.

db\_shares — Could not open shares.

db\_shares — Failed to read record.

isgen — completed: additional boot time Data in Equipment Configuration Database (ECD) form btparm.

kpcb\_frsn — Exceeded maximum number of pfile segments.

kpcb\_put — Write failed.

kpcb\_seglist — Segment in listed is marked common, but csize is zero.

pf\_cpyseg — Write failed.

pf\_csize — Cannot find kboot data.

pf\_csize — Cannot find kboot text.

pf\_csize — Cannot find kernel bss.

pf\_csize — Cannot find kernel data.

pf\_csize — Cannot find kernel text.

pf\_csize — Cannot find tv.

pf\_csize — Invalid request.

pf\_fill — Write failed.

pf\_flags — Invalid magic number.

pf\_flags — pfile listed has more than one share segment.

pf\_flags — pfile listed has share segment, but not declared as a child.

pf\_fndshdr — Seek failed.

pf\_fsize — Cannot find data of a.out.

pf\_fsize — Cannot find kernel data.

pf\_fsize — Cannot find kernel text.

pf\_fsize — Cannot find text of a.out.

pf\_fsize — Cannot find tv.

pf\_fsize — Invalid request.

pf\_fstart — Cannot find data.

SEE PROPRIETARY NOTICE ON COVER PAGE

## 2. REASON FOR OUTPUT

To report the result of executing a UPD:OMDB input message.

## 3. VARIABLE FIELD DEFINITIONS

- a List of message keys for which the UPD:OMDB completed successfully.
- b List of message keys for which the UPD:OMDB failed.
- c Further explanation of error:
  - INVALID ALARM
  - INVALID KEY
  - INVALID MSGCLS
  - SYNTAX ERROR
  - TOO MANY KEYS

SEE PROPRIETARY NOTICE ON COVER PAGE

#### **4. ACTION TO BE TAKEN**

For format 2, verify that the key(s) was entered correctly.

For format 3, determine if the disk is available. If the disk is available, verify the status of the Output Message Database (OMDB) disk file by using the **OP:STATUS;LISTDIR** command for **/cft/spl/omdb**.

Format 5 indicates a possible file system problem, such as lack of available disk space. The update being processed is not saved in the OMDB logfile (**/cft/spl/OMDB\_LOG**).

For format 6, verify that the Coordinator Of Spooler Output Processes (CSOP) is running.

For format 7, verify that the input message was entered correctly.

TYPE ..... Output

## 1. FORMAT

UPD REPT a  
b  
[c]  
[PATHNAME: d]  
[VALUES e]  
[TAG=f ERRNO=g]

## 2. REASON FOR OUTPUT

To specify errors or events that occurred as a result of performing a software update activity.

## 3. VARIABLE FIELD DEFINITIONS

- a Category of the report message:
- INFORMATION — Informational message associated with some software update activity.
- SYSTEM ERROR — System error encountered during some software update activity.
- USER ERROR — User error encountered attempting to execute a software update command. Most often the result of bad input to the command.
- WARNING — A non-fatal problem was encountered while executing a software update activity that did not cause the command to abort, but may require attention.
- b A brief text phrase describing an error or providing information associated with a software update activity:
- FILE MANAGER CALL FAILED DUE TO BUSY FILE
- MULTIPLE INVOCATIONS OF SUucm NOT ALLOWED
- NOT ENOUGH FREE SPACE TO INSTALL FILE
- PREVIOUS SU HAS TEMPORARY UPDATE ON THIS FILE
- THIS IS NOT THE LATEST SU THAT CAN BE BACKED OUT
- UPDATE ITEM IS IN OFFICIAL STATUS
- c The SU name associated with the report message.
- d Pathnames of the files associated with this report 1 per line.

SEE PROPRIETARY NOTICE ON COVER PAGE

- e Values associated with the text message in the category of the report message listed, 4 per line. These provide the data which caused the text message to be printed.
- f A tag value which indicates the location where the error message originated from. This value is used by LUCENT personnel for troubleshooting purposes.
- g A unix system error number.

#### 4. ACTION TO BE TAKEN

For INFORMATION category messages, no action is necessary.

For the SYSTEM ERROR, USER ERROR, and WARNING categories, the specific action required depends on the text phrase field in the message. Most of these reports require technical assistance; however, some can be corrected and are listed alphabetically. If these actions do not succeed, then seek technical assistance:

FILE MANAGER CALL FAILED DUE TO BUSY FILE This indicates that a file manager operation on the pathname(s) given in field listed cannot be performed because a process or user has one of those files open. If this problem is corrected a retry of the failed command will usually succeed.

MULTIPLE INVOCATIONS OF SUucm NOT ALLOWED There is already a SU command running which must be completed before another command is given. Retry the command at a later time.

NOT ENOUGH FREE SPACE TO INSTALL FILE Check the filesystem referred to by listed pathnames for un-necessary files which may be using up all of the space.

PREVIOUS SU HAS TEMPORARY UPDATE ON THIS FILE The previous SU name listed must be made official before the current SU can be applied because they have overlapping updates.

THIS IS NOT THE LATEST SU THAT CAN BE BACKED OUT Use the display commands on 1950 MCC page to determine which SU needs to be backed out first.

UPDATE ITEM IS IN OFFICIAL STATUS The SU in name listed has at least one update made official. That means that a SU must be backed out using the Back Out Last Official (BOLO) SU mechanism on the 1950 MCC page.
